The great and important discoveries and inventions are not the work of a single day, or of one individual alone, but are the products of time and of progressive development. Each generation is indebted, to a large extent, to its predecessor for the facts and principles which ultimate in useful and brilliant discoveries.

The great discoverers and inventors in one age have built upon the foundations laid by others, and have crowned their work. Newton, "whose discoveries pour in day upon the works of God, as if a second fiat for light had gone forth out of His own mouth," founded the theory of universal gravitation upon principles before established by Kepler; yet much of Kepler's knowledge was derived from the study of the Copernican and Ptolemaic systems.

Herschel is entitled to great honor for the invention of his telescope of wondrous magnifying power; yet, without derogating from his just fame, history traces the discovery of the telescope, though in an imperfect condition, to Galileo, and from him traces the principles of its construction still further back to three almost unknown competitors for the distinguished honor of original discovery, to Metius, Jansen and Lippershein.

The discovery of America is due to the enterprise, skill, patience and implicit faith, and even to the temerity of Christopher Columbus, and he is entitled to that honor without abatement or diminution. Yet Paulo Toscanelli, a learned cosmographer of Florence, prepared the map which guided Columbus in his first voyage of discovery. The Northmen visited the north-east coast of America in the tenth century and planted a colony in Greenland, with which they afterwards maintained intercourse.

All honor to Robert Fulton, whose steamboat was pronounced a failure in 1803, and in 1807 a success, because its speed was then five miles an hour on the glassy Hudson. Yet James Watt had brought the steam engine to a high state of perfection in England as early as 1775. The power of steam had been known for centuries, and unsuccessful experiments had been made to harness it to machinery, both on land and on water, in regions most remote, but its useful application to lighten labor and facilitate business is of recent date.

The Great Store of Invention and Discovery

Stand out before the world in grand and striking proportions, like the Mississippi and Amazon rivers; but we know as little of the aids, incentives and inspirations that contributed to their success as we do of the springs, rills and streamlets that are tributary to those great rivers.

The present century has been most

Fruitful in Useful Inventions,

Improvements and discoveries, and the production of mechanical industries is fabulous.

There are those living that saw the first steamer that skipped over the laughing Hudson, now renowned for its floating palaces. In 1819, the first transatlantic steam line was established between Savannah, Georgia, and England. This line had one small steamer, named *Savannah*, that made its first trip from Savannah in 1819. Now all of the wharves of our great cities are lined, and all of our bays, lakes, rivers and oceans are dotted with steam crafts bearing the commodities and commerce of all zones.

Steam wagons preceded the railway locomotive. In 1770, Cugnot, a Frenchman, constructed a steam wagon for use on common roads. Robert Watt, of England, patented a road engine in 1784. In 1787, Oliver Evans obtained from Maryland the exclusive right to propel wagons by steam in that State.

The first high pressure locomotive was built in England in 1802, and the second in 1804. George Stephenson, of England, in 1814, constructed the first locomotive that attained a speed of six miles per hour.

The first section of the great commercial highway now known as the Baltimore and Ohio railroad was begun July 4, 1828, and was at first operated by horses.

The first locomotive constructed in the United States was built by the well-known Peter Cooper, in Baltimore, in 1830. Two years previously there had been a shipment of a limited number of locomotives from England. When we survey the map of the United States, with its network of railroads, stocked with cars and engines, and hearing the inhabitants and commodities of all climes onward swiftly to their destination, and consider that all of these mechanical energies are the production of the last half century, we are not only amazed, but distrust both our eyes and history.

The telegraph has become one of the most useful and

Important Factors in Business.

The almost instantaneous transmission of intelligence from continent to continent, and from pole to pole, has contributed greatly to equalize, harmonize and civilize mankind.

In 1844, Professor Morse constructed the first telegraph line in the United States, between Baltimore and Washington. Cyrus W. Field connected America with Europe by submarine telegraph laid across the Atlantic, August 5, 1858. Since, 200 cables have been laid, with a length of 50,000 miles.

In less than 40 years, telegraph lines have been extended, with their myriad arms streaming with lightning, all over the habitable globe, and made continents vocal with their magical power.

The telephone is an instrument of recent invention. Prof. Reuss, of Germany, has the honor of first discovering this new agency, in the year 1865. Afterwards, Prof. Gray devised the harmonic telephone. The speaking telephone was subsequently produced by Mr. Bell, of Massachusetts. Mr. Edison has devised a telephone that transmits vocal sounds over long distances with great distinctness. This system of transmitting sound is now in its infancy, and no one may anticipate the rich results of full development.

The Electric Light

Is a new agency for illumination, of so much power and brilliancy as to emulate the sun in the intensity of its brightness. Faraday, an English scientist, discovered this method of illumination in 1832. The announcement of this discovery at once attracted others to this new field of enterprise. As old miners seek the spot in haste where new and rich lodes are reported, and eagerly prospect for greater developments, so electricians and scientists sought for both fame and fortune in this new and glittering field of attraction.

In this new field of experiment, the efforts of the youthful Brush, of Cleveland, have been attended with remarkable success. With his method and apparatus this city is provided with an agreeable, steady light, so intense as to convert the darkness of night into the light of day, and at rates so moderate as to defy competition.

Electricity appears to be the great reserved force of nature to supply mankind with light, heat and power, when nature's other sources of supply are exhausted, and thus to continue the present system in the world's economy.

The cable road, for its convenience, for its celerity of transit, for its cheapness, and for its utter disregard of elevation, deserves special mention.

The beautiful cable car, as it faces the upward grades and steeps, without horses, and without any apparent propelling power, begins its course with a gentle movement, and then glides majestically up the acclivity like a phantom, and as if instinct with life.

The result of this achievement is to make accessible otherwise inaccessible parts, to justify the construction of houses and homes and palaces on the highest and loftiest points, to give value to property otherwise valueless, and to add largely to the wealth of individuals, cities and States.

This car, with its grip, slot, brake and revolving cable, was first used on Clay street hills, in the city of San Francisco, in the year 1873. It is now adopted on five prominent roads in this city, and the fame of its unprecedented success is spreading to distant cities.

The merit of this invention is enhanced here by the consideration that its author is a gentleman well known and of long residence in this city, and a worthy member of this Institute, and for many years was its honored head—A. S. Hallidie, Esq.—who has made other discoveries and inventions, which give him high rank among inventors, and among those who have done signal service to the community and their race.

We have no criterion or rule by which to measure or calculate the

Possibilities of the Future.

It is certain that the elements, powers and forces of nature are not fully, yea, only partially revealed. There may be some power, like electricity (whose discovery and application to material uses are recent), now lying dormant and unknown, the discovery of which, hereafter, may revolutionize the business and change the current of human affairs.

Every new principle developed, every invention and improvement in art, all advancement in science and philosophy, form the basis, the capital for other and greater and grander achievements and triumphs.

The men of this age are fortunate indeed in holding this advanced position, fortunate indeed in the possession of the vast patrimony of others' experience, knowledge and wealth; in the possession of all of the inventions, and of all of the discoveries, and of all of the achievements in labor, learning and thought of all preceding ages.

The working capital of this age is not limited to gold, silver, stocks, houses, land, hooks and machinery, nor to any material work of convenience, necessity or luxury, though valued at countless billions; but it includes all systems of ethics, religion, government and philosophy, all generous and patriotic sentiments, all philanthropic and charitable endeavors, all of the

strength and sweetness of friendship and affection, all love of right and justice, all veneration for parents and adoration for God, and all of the skill, talent, high purpose and knowledge, ambition and genius of the human race.

The Zeal and Works of the Members of the Mechanics' Institute.

It is most gratifying to know that the members of this Institute have contributed their share to this working capital, and that they have co-operated with the earnest workers, the wise and illustrious, in the progressive movements of the age.

They have constructed this palatial temple—so spacious, fitting and fascinating; so well adapted to the purposes for which it was designed; so honorable to those who originated and erected it, and dedicated it to the arts and sciences, and it is now replete with models of taste, skill, thought and genius.

They have, with great care and judgment, selected and purchased more than 30,000 books for public instruction, entertainment, culture and refinement.

"All that mankind has done, thought, gained or been, is lying, as in magic preservation, in the pages of these books."

> "Golden volumes, richest treasures,
> Object of delicious pleasures,
> You, my eyes rejoicing, please,
> You, my hands in rapture seize.
> Brilliant wits and musing sages,
> Lights who beamed through many ages,
> Left to your conscious leaves their story,
> And dared to trust with you their glory."

All are invited to come and drink deep from these fountains of knowledge.

All should patronize this library for their own pleasure and improvement, and in recognition of the eminent services of its founders—

> "Come take choice of all my library,
> And so beguile thy sorrow."

The managers of this institute have, with great and unrequited labor, bought this costly and valuable block and constructed this enchanting pavilion for the glory and advancement of this metropolis, and to promote the highest interests of all the people of this coast. How difficult, if not impossible, to estimate the advantages and

Benefits Derived from this Enterprise.

In this hall are collected rare, beautiful and useful models of painting, sculpture and mechanism, attracting and exciting the curious, stimulating the ingenious and enterprising, and diffusing useful knowledge to all.

The glittering display of associated mental and material wealth in machinery, in speaking statues, in resplendent paintings laughing with life, in combination with the exhibition of light, steam, electricity, sound and motion, make this an attractive spot for students of taste and genius.

The youth will annually come here to witness the marvelous displays of mechanical ingenuity and of the fine arts; manhood for instruction; and decrepit old age to take note of the changes, the new fields explored, the work accomplished, and will rejoice in the ever-accumulating evidences, here exhibited, of the ingenuity, wisdom and creative power of man.

Beneath the light of this institution, and under the stimulus of its influence, new modes of the use and application of nature's powers have been discovered, that have contributed largely to the wealth, power and renown of the "Queen City" of the Pacific.

Through the benignant influence of this institution, some of the hidden forces of nature have been revealed and brought into useful activity.

The great poet-philosopher, Pope, thus described Nature when delivered by Maker to man:

> All Nature is but art, unknown to thee;
> All chance, direction, which thou can'st not see;
> All discord, harmony, not understood;
> All partial evil, universal good.

As the Parthenon, built under the highest inspiration of the Grecian art by its great master, Phidias, added largely to the luster and renown of Athens; and as the Colosseum contributed largely to make Rome illustrious for nearly 20 centuries after the last vestage of her government

> "Had gone glimmering through the dream of things that were,"

So the Mechanics' Institute, now in the first period of its existence and usefulness, will contribute to the just fame of San Francisco through coming ages, down to the last syllable of recorded time.

This institution is truly one of the great auxiliaries of mechanical power. It is both the duty and interest of the intelligent and enterprising, and of all classes of this city and State, to give this institution a generous support.

Each year, in this pavilion, are presented new facts, ideas and inventions, from which other ideas and inventions will be evolved, forming links in the great chain of progressive development, beginning with the first ages and extending onward to the close of time.

Through the arduous labors of the founders and supporters of this royal institution, this most magnificent display of chemical agencies, of mechanical energies, of agricultural products and manufactured fabrics, is spread out before our enchanted vision in endless and magnificent profusion.

The scene before us represents the diversity of our interests; the richness and bounty of our teeming productions; the vastness of our population; the culture and refinement of our people, and the magnitude, grandeur and capacity of our city, State and country.

The Denver Exposition—No. 1.

(Editorial Correspondence).

The exposition has now reached the tenth day of its continuance, and is even yet far from complete. Large quantities of minerals and other exhibits are arriving every day. As an exhibition it is a success; but in point of attendance I am inclined to think it is not what was anticipated. The exposition building is really a fine structure, and quite well calculated for its purpose. It is substantially constructed of brick, iron and glass, in the form of a Roman cross. A broad gallery runs entirely around the structure, with a promenade balcony similar to the one in the San Francisco Mechanics' Institute building. But the effect, so far as the general view is concerned, is much inferior, in consequence of the cruciform, rather than rectangular, form of the building. The management has evidently made a great mistake in placing it so far out of town—about four miles. It is reached by two lines of steamcars at a cost of ten cents each way. The trains, which belong to different companies, alternate and run every half hour; but people

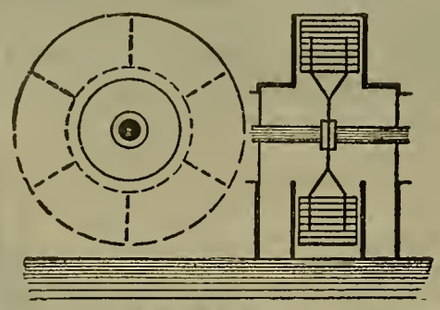

FIG. 1.—NASMYTH'S VENTILATING FAN.

will not go four miles very often, or in very large multitudes, to witness an exhibition. The Mechanics' exhibition in San Francisco would be an utter failure if placed out beyond Bernal Hights, with double car fare, no matter how complete and rapid the communication might be. The attendance would fall off more than one-half.

The Mineral Exhibit.

A brief visit of a few hours, this morning, was not sufficient to take in any very particular estimate of the mineral exhibit. I saw enough, however, to satisfy myself that it is good, and must commend itself to the public generally. There is one great fault, however, in the arrangement. The mineral exhibit already in the building ought to occupy twice the space into which it has been crowded. I have no knowledge of where the responsibility lies—whether the exhibitors failed to ask for more space, or whether the management crowded them into their present circumscribed limits. Although the building is quite well filled, or at least will be when everything is in its place, still the

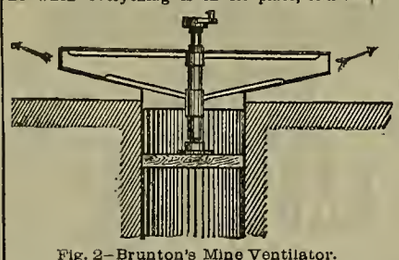

Fig. 2—Brunton's Mine Ventilator.

public was given to understand that the leading feature of the exhibition was to be mineral, and so it is in fact, but not in display. Every foot of the south wing, or long arm, of the cross should have been entirely given up to minerals. There is quite enough there to fill it well. Such an arrangement would have added largely to the character of the exhibit, especially in the eyes of visitors from abroad.

The Governors of all the Pacific States and Territories have taken a lively interest in this exposition, and the lack of a representation from California is not at all due to any want of interest in the matter on the part of Gov. Perkins; but in the absence of a legislative assembly, or any authorization to move public property out of the State, he was powerless.

The Place of Honor.

At the very entrance of the pavilion, was left for California. Every other State and Territory—even Colorado herself, which last year took the lead in bullion—has voluntarily taken a back seat to let in the first born of the Pacific States with the magnificent exhibit which all recognized she *could*, and which most people have fully believed she *would*, present. That place is still conspicuous for its emptiness, and will probably continue so throughout the entire exposition. It is creating a worse impression among visitors than did the empty and useless mansion which she reared on the Centennial grounds at Philadelphia, six years ago. Eastern visitors, particularly, express much surprise, as all such had fully expected to see something unusually fine from the gold-yielding mines and placers of California.

The Mineral Exhibit

Is in no sense a mere advertising dodge for individual mines. The mines are here in mass. There are rich specimens, it is true; but with them, and displayed directly by their side, are the average ores, in huge blocks, as large as could well be raised from a mine and transported across the country. This exhibit, it is true, opens the door for legitimate advertising. It presents a great object-lesson, where visitors may come and examine at their leisure, and compare one mine with another, and study effectively the great mineral wealth of the entire territory which is represented. Even leaving out California, there is no other region of country on the globe, of many times its extent, where such a rich and varied representation can be made. We have here the gold of the Indies, of Africa and the Ural, the silver of Potosi and Mexico, the copper of Lake Superior and Chili, the lead of Galena and the northern Mississippi, the iron of Sweden and Great Britain, the coal of England and Pennsylvania, to say nothing of other minor mineral products. All the regions named, even if united, would scarcely be able to equal in similar resources the compact extent of country represented at this the first real mineral exhibition ever made; for it is in marked superiority to the mineral show at the Centennial, large and fine as that was.

A National Mineral Museum

It is the intention of the managers to make the exhibit a permanent one. Most of the minerals here will be suffered to remain permanently, to form the nucleus of a national mineral museum, to be added to from year to year, as annual special expositions will be made, similar to the present effort. The idea is a good one; but to be a useful success it must be placed under a suitable mineralogist for scientific classification and arrangement. The enclosing

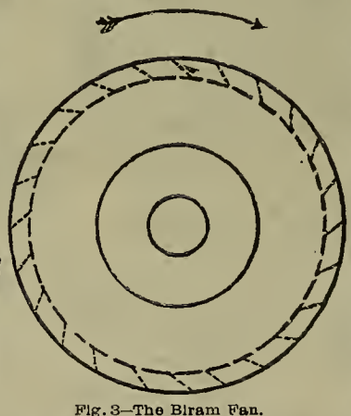

Fig. 3—The Biram Fan.

rocks, as well as ores, of every mine should be shown, and at all their various depths, and a proper descriptive catalogue should be made of every mineral, with a brief history of the output and assessments, and every other important matter connected with every mine. An exhibit thus prepared would be of invaluable benefit to the country at large, and especially to the mining expert and student of mineralogy.

Machinery.

But little heavy machinery is in place, although that portion of the work is being pushed with energy. The motive power is furnished by a very superior Corlis engine of 250-horse power, which drives a 25 in. belt with a 16 ft. wheel. The engine is from the shops of Fraser & Chalmers, Chicago. During a hurried walk around the pavilion, I noticed as California machinery one of Hurlington's oscillating stamp mills, a Frue concentrator, Hendy's improved amalgamator and Challenge ore feeder. There is not as much mining machinery in the building as one would naturally expect to see; although it is possible it may yet come in. There are several hoisting engines, and the usual exhibit of pumps, blowers, etc. Also a large model of an elevated cable road for the transportation of passengers.

The building is lighted in the evening by the Weston Electric Light Company, of Newark, N. J.

There is a large, varied and very good show of the miscellaneous trades and industries. The most of the agricultural machinery, wagons, carriages, etc., are in two annexes outside the main building. I shall endeavor to enter more into particulars in my next letter.

W. B. Ewer.

Fans for Mine Ventilation.

We have recently illustrated several devices for mine ventilation, described by C. M. Percy, M. E., in the *Colliery Guardion*, and now show engravings of others.

Nasmyth's fan (Fig. 1) did not make for its author a name equal to that earned by his great work in connection with the steam hammer, but is remarkable in being the first attempt on a large scale to apply the principle to mine ventilation. The fan was 13½ ft. diameter, with eight vanes, each three feet six inches wide and three feet long. The fan worked within a casing, consisting of two fixed sides of thin wrought plate, entirely open round the circumference, the sides being three inches clear from the edges of the vanes, and having a circular opening of six feet diameter in the center of each, from which rectangular wrought-iron trunks were carried down for the entrance of air. The two air trunks joined below the fan, and communicated with the pit by means of a horizontal tunnel, which entered the pit seven yards below the surface. This fan was worked at 60 revolutions per minute, giving a velocity at the circumference of the fan of 2,545 ft. per minute. The results from this fan were considered so satisfactory that it was proposed shortly afterwards to construct one 21 ft. in diameter. It gives one an idea how people were seeing that large fans were becoming necessary that whereas Mr. Nasmyth, before the British Association some few years previously, recommended fans four feet six inches in diameter, he actually fixed one 13 ft. 6 inches, and afterwards proposed 21 ft.

Brunton's fan (Fig. 2) preceded Nasmyth's, but was on a much less scale, and did not attain the same amount of success. It consisted of a horizontal wheel nine feet in diameter, covering the top of the air shaft, with a large number of vanes, inclined like the vanes of a windmill or the blades of a screw. The air had access to the vanes on the under side, and was expelled from the upper side of the fan. The plan was found to be unsatisfactory as a means of ventilation, and was entirely abandoned. In 1855, another fan of Brunton's was tried, and this time it was 20 ft. in diameter, with bladee radial and vertical. The construction was still that of a horizontal wheel placed over the pit. The air entered at the center of the lower side, and was expelled at the circumference.

Biram's fan (Fig. 3) was the first attempt to form the blades upon correct principles. Instead of following in the lines of Nasmyth and Brunton, and having radial blades, they were inclined backwards. One of these fans, about 24 ft. diameter, was erected in Durham, and some experiments were given, as showing so low a useful effect as 12½%; but the author of the experiment rather overdoes it by saying that, from experience with other open-running fans, he considers this percentage cannot be materially exceeded by any similar form of open fan without a casing. This means that Biram's was the best of the open-running fans; but the same writer admits further on, that Waddle, with his open-running fan, obtained 39%, and the North of England Committee has (December, 1881) reported experiments upon a Waddle fan showing nearly 53% useful effect. It was not a fan likely to obtain a very high useful effect, as compared with others since introduced, but it was certainly equal to more than 12½%, and its inventor deserves credit for having introduced into mechanical ventilators inclined blades.

Biram, in his specification, dated 4th June, 1853, argues that as the efficacy of a fan must be mainly produced by the outer end of the vanes, it was desirable to have their depth, not as with Nasmyth's, one-half the radius, but only one-tenth, and increase their number to so many that a tangent from the root of one blade would just clear the top of the next. The idea being that each blade would exactly sweep out all the air between two blades whilst that portion of a revolution was made equal to the distance from one blade to the next. So that for every complete revolution each blade would sweep out a quantity of air equal to the capacity between all the blades. In this same specification there are illustrations and descriptions of improvements in winding. It was proposed to fix the drums upon which flat ropes are wound over the pit for drawing up coals, and applying the power of two engines to cranks fixed at right angles to each other, upon the shaft of one of them, the other having also cranks at the end of the shaft similarly fixed, and the two being connected by coupling bars exactly in the way four driving wheels are connected in a locomotive engine. The advantage of this arrangement is, besides dispensing with a flywheel and extra pulleys over the pit top, the facility which it gives of enclosing the whole of the machinery within a moderate-sized building, and giving the engineman better sight, therefore better control of his engines. Biram appears to have been indefatigable in his endeavors to effect improvements in the working and winding of coals, and will always be remembered in connection with the anemometer and ventilating fan which bear his name. The fans that have come into most general use, and deservedly so, are the Waddle, Schiele and Guibal.

CHICAGO **FRASER & CHALMERS,** ILLINOIS.

MANUFACTURERS OF IMPROVED AND APPROVED FORMS OF

MILL AND MINE MACHINERY.

Having made extensive additions to our Shops and Machinery, we have now the LARGEST and BEST APPOINTED SHOPS in the West. We are prepared to build from the Latest and Most Approved Patterns,

QUARTZ MILLS

For working gold and silver ores by wet or dry crushing. The Stetefeldt, Howell's Improved White, Brunton's & Bruckner Furnaces, for working base ores. Rotary Dryers, Stetefeldt Improved Dry Kiln Furnaces.

SMELTING FURNACES,

Water Jackets, either Wrought or cast iron, made in sections or one piece, either round, oblong, oval or square. Our patterns most extensive in use. SPECIAL FURNACES FOR COPPER SMELTING. Slag Pots and Cars, improved form. Bullion and Copper Moulds and Ladles, Litharge Cars and Pots, Cupel Furnaces and Cars.

HOISTING ENGINES Large or Small for flat or round rope. Double Cylinder Engines, from 6x10 to 18x60. This latter size furnished J. B. Haggin for Giant and Old Abe Co., Black Hills also Corliss Pumping Engines, 26x60, for Hoisting and Pumping Works, for 2,000 feet deep. **Baby Hoists for Prospecting, 4 H. P. to 6 H. P.**

Wire Rope, Safety Cages and any Size and Forms of Cars. **McCaskell's Patent Car Wheels and Axles—Best in Use.**

Principal Office and Works, Fulton and Union Sts., Chicago, Illinois. **New York Office, Walter McDermott, Manager, Room 32, No. 2 Wall St.**

Frue Ore Concentrator, or Vanner Mills.

Coarse Concentrating Works, Improved Jigs, Crushing Rollers, Sizers, Trommels, Rittenger Tables, and all other adjuncts for the proper working of Gold, Silver and Copper Ores, complete in every detail.

HALLIDIE IMPROVED ORE TRAMWAYS. We refer to Gen. Custer mine, Idaho, 5,000 feet long; Columbus Mine, Col., 4,750 feet long; Mary Murphy mine, Col., 5,000 feet long, all in constant operation.

LEACHING MILLS,

Improved Corliss and Plain Slide Valve Meyer's Cut-off Engines.

CORLISS ENGINES from 12x36 Cylinders to 30x60. PLAIN SLIDE VALVES from 6x10 to 36x36. BOILERS of every form, made of Pine Iron Works C. H. No. 1 Flange Iron, or Otis Steel. Workmanship the most careful. All Rivets Hand Driven.

THE CALIFORNIA POWDER WORKS.

MANUFACTURERS OF

Sporting, Cannon, Mining, Blasting and

HERCULES POWDER

HERCULES POWDER will break more rock, is stronger, safer and better than any other Explosive in use, and is the only Nitro-Glycerine Powder chemically compounded to neutralize the poisonous fumes, notwithstanding bombastic and pretentious claims by others.

It derives its name from HERCULES, the most famous hero of Greek Mythology, who was gifted with superhuman strength. On one occasion he slew several giants who opposed him, and with one blow of his club broke a high mountain from summit to base.

No. 1 XX) is the Strongest Explosive Known.

No. 2 is superior to any powder of that grade.

PATENTED IN THE UNITED STATES PATENT OFFICE.

ORDERS RECEIVED FOR HERCULES CAPS AND FUSE.

JOHN F. LOHSE, SEC'Y.

Office, No. 230 California Street - - San Francisco, Cal.

Colorado Iron Works,

MANUFACTURERS OF

ENGINES, BOILERS, RAILWAY CAST AND WROUGHT WORK, BRIDGE WORK, BOLTS AND BOLT ENDS, BUILDING WORK, ETC.

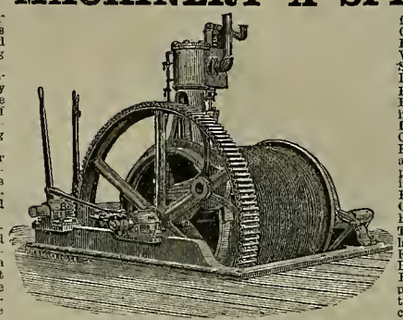
MINING MACHINERY A SPECIALTY.

Our manufactures of mining machinery embrace every kind of machine and appliance for the mining and reduction of ores.

We have had an experience of more than twenty years in the manufacture and practical operation of mining machinery in Colorado and the neighboring States and Territories.

Our facilities are superior to those of any manufactory in the West, our works having been recently rebuilt, greatly enlarged and completely equipped.

We invite the investigation of mine owners and mill men seeking machinery. We can furnish, on board, at our works, or set up at the mines anywhere in the Rocky Mountain region, on short notice, the following machinery: Cornish Pumps, Steam Pumps, Stamp Mills for Wet or Dry crushing, Pans, Settlers, Agitators, Retorts, Bullion and Ingot Moulds, Reverberatory Furnaces, Bruckner Cylinders, Revolving Roasting Furnaces and Dryers, Melting Furnaces, Concentrating Machinery, Rolls, Crushers, Conveyors and Elevators, Ore Samplers and Grinders, Hoisting Engines, Water Jacket Furnaces, Slag Pots and Cars, Lead Pots and Ladles, Blast Pipes and Water Tuyeres, Blowers, Cupella Ion Furnaces, Market Rattles, Wire Rope, Cages, Buckets, Skips, Ore Cars, etc. Estimates furnished and prices quoted on application. Send for illustrated catalogue.



COLORADO IRON WORKS,

P. O. Box, 1921, - - - - Denver, Colorado.

Contains no Nitro-Glycerine or Chlorate of Potash, and is the only High Explosive Manufactured in America that does not contain these Dangerous Ingredients.

In Use for Seven Years Without a Single Accident

TONITE POWDER CO.,

No. 310 California Street, - - - SAN FRANCISCO.

14 Drum St., S. F. Trenton, N. J. 117 Liberty St., N. Y.

THE JOHN A. ROEBLING'S SONS CO.,

Manufacturers of

Iron and Steel Wire.

Telegraph Wire, Ship Rigging, Wire Fencing,

Street Railway Ropes Tramway Ropes, Hoisting Ropes,

FLAT ROPES A SPECIALTY.

New Jersey Wire Cloth Co., S. V. MOONEY, Manager.

ESTABLISHED 1868.

GOLD SAVED

BY USING MY

SILVER PLATED AMALGAMATING PLATES.

These Plates are used in Quartz, Gravel and Placer Mining with gratifying success. I am constantly filling orders for them, and when once used they prove themselves so superior to any other process yet discovered for saving Gold that my customers would not do without them. I have the best facilities on this coast for filling orders for these plates, and will guarantee my work. Old Mining Plates Bought, Taken in Exchange for New, or Re-plated.

Pacific Gold, Silver and Nickel Plating Works,

Send for Circular 101 and 103 Geary St., Corner Dupont, San Francisco, Cal.

W. E. SHEPMAN, Proprietor.

STEEL CASTINGS

FROM 1-4 TO 10,000 lbs. WEIGHT.

True to pattern, sound and solid, of unequaled strength, toughness and durability.

An invaluable substitute for forgings or cast-iron requiring three-fold strength.

Gearing of all kinds, Shoes, Dies, Hammerheads, Crossheads for Locomotives, etc.

15,000 Crank Shafts and 10,000 Gear Wheels of this Steel now running prove its superiority over other Steel Castings.

CRANK SHAFTS, SHOES, DIES and GEARING specialties.

Circulars and Price Lists free. Address

CHESTER STEEL CASTING CO.,

Works, CHESTER, Pa. 407 Library St., PHILADELPHIA

WATER JACKET SMELTING FURNACES

—FOR—

Galena Silver & Copper Ores.

The PACIFIC WATER JACKET SMELTERS embrace many features that are entirely new and of great practical utility, which are covered by letters patent.

No other furnaces can compare with these for durability and in capacity for uninterrupted work.

MORE THAN SIXTY of them are now running on the Pacific Coast, giving results never before obtained as regards continuous running, economy of fuel, grade and quality of bullion produced. We are prepared to demonstrate by facts the claims here made.

These Smelters are shipped in a complete state, requiring no brick or stone work, except that for the crucible, thus saving great expense and loss of time in construction.

Complete smelting plants made to order of any capacity and with all the improvements that experience has suggested as valuable in the class of machinery. Skilled and experienced smelters furnished when desired to examine mines and to superintend construction and running of furnaces. Estimates given upon application.

Send for circular.

RANKIN, BRAYTON & CO.

SHEET IRON PIPE.

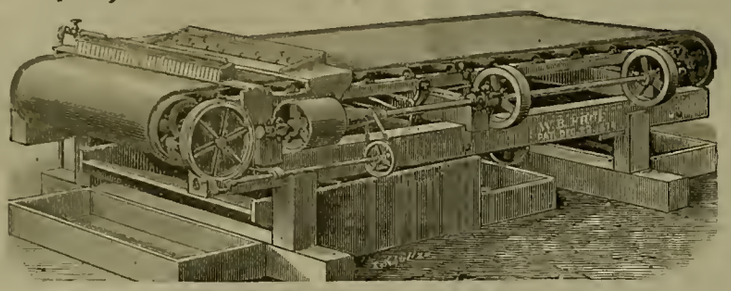
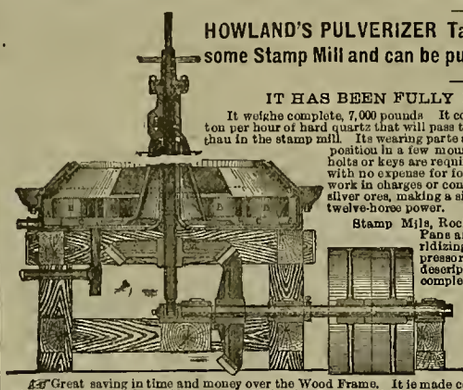
$1,000 CHALLENGE!



THE FRUE ORE CONCENTRATOR.

Nearly 300 are now in use, giving entire satisfaction. Awarded First Premium and Silver Medal at the Industrial Fair for 1880 of the Mechanics' Institute of San Francisco, Cal.
Saves from 50 to 100 per cent. more than any other Concentrator in use, and concentrations are clean from the first working. The wear and tear are merely nominal; water required is less than in any other wet Concentrator; the power required per machine is less than one-half horse power; the labor required is light, one man on a watch can attend to sixteen machines.
We challenge any other Concentrator in use for a fair and impartial competitive trial, side by side, for stakes of $1,000 each, and we mean business.
☞ A machine with all improvements can be seen in working order and ready to make tests, at the office of Hinckley, Spiers & Hayes, 220 Fremont street.
ADAMS & CARTER, Agents, Room 7 No. 109 California Street, S. F.

MOREY & SPERRY,
MANUFACTURERS OF
Gold and Silver Grinding and Amalgamating Machinery



HOWLAND'S PULVERIZER Takes the Place of the Cumbersome Stamp Mill and can be put up in one day ready for work.

IT HAS BEEN FULLY PROVED AND TESTED.

It weighs complete, 7,000 pounds It costs $1,500 ready for the belt Will crush one ton per hour of hard quartz that will pass through a 40-mesh screen. The wear is less than in the stamp mill. Its wearing parts are plain castings and can be dropped into position in a few moments, as shown by the letters A, B and C, no bolts or keys are required; it can be set upon the floor of a mill with no expense for foundations, and can be used to crush and work in charges or continuous. It will amalgamate either gold or silver ores, making a simple, cheap and effective mill, it requires twelve-horse power.

Stamp Mills, Rock Breakers, Crushing Rolls, Amalgamating Pans and Separators for Gold and Silver ores Chloridizing Furnaces, Retorts, Rock Drills Air Compressors, Steel Shoes and Dies for Stamps, and every description of Mine and Mill Supplies Iron Work complete for Wood Frames, also

SPERRY'S WROUGHT IRON FRAME FOR STAMP MILLS.

☞ Great saving in time and money over the Wood Frame. It is made complete with Wrought Iron Frame ready to put upon the foundation. We construct Mills with Stamps weighing from 350 to 900 pounds for Gold and Silver Ores Wet or Dry Crushing Mortars.

PATENTS AND INVENTIONS.

List of U. S. Patents for Pacific Coast Inventors.

From the official list of U. S. Patents in DEWEY & Co.'s SCIENTIFIC PRESS PATENT AGENCY, 252 Market St., S. F.

FOR THE WEEK ENDING AUGUST 8, 1882.

262,273.—TWO-WHEELED VEHICLE—John A. Bilz, Pleasanton, Cal.

262,367.—WINDOW—M. B. Burk, Dayton, W. T.

262,407.—INCUBATOR—Jas. M. Halsted, Oakland, Cal.

262,227.—STEAM ACTUATED VALVE—Wm. D. Hooker, Oakland, Cal.

262,228.—PUMPING ENGINE—Wm. D. Hooker, Oakland, Cal.

262,488.—VEHICLE BRAKE—Dyas Shelton, Santa Rosa, Cal.

262,254.—ANCHOR—R. R. Spedden, Astoria, Oregon.

262,328.—TRUSS PAD—Jos. S. Starson, S. F.

262,510—TONGUE SUPPORT—Tiffin & Smith, Redding, Cal.

262,259.—CANISTER—John H. Tingman, S. F.

262,262.—HEADER BAR—Geo. B. Vroman, Oakdale, Cal.

NOTE.—Copies of U. S. and Foreign Patents furnished by DEWEY & Co. in the shortest time possible (by telegraph or otherwise) at the lowest rates. All patent business for Pacific coast inventors transacted with perfect security and in the shortest possible time.

Notices of Recent Patents.

Among the patents recently obtained through Dewey & Co.'s SCIENTIFIC PRESS American and Foreign Patent Agency, the following are worthy of special mention:

VEHICLE.—John A. Bilz, Pleasanton, Cal. No. 262,273. Aug. 8, 1882. The object of this invention is to overcome the particular disadvantages attending vehicles of the two-wheeled class; namely, the communication of the jogging motion of the horse to the seat, and to render the vehicle, by suitable construction, an easy and pleasant mode of conveyance. The several connections between the shafts and axle, shafts and body, and the body and springs, are none of them rigid. An independent movement may be had by each. The consequence is, that the shafts, which primarily receive the jogging motion of the horse, do not communicate it, to any great extent, to the axle, and the latter does not affect the body, neither giving to it whatever motions it might receive from the shafts, nor its own jogging motion; nor do the shafts affect the body in front, as the springs within certain tubes yield sufficiently to counteract it, this being rendered possible because of the rocking of the body upon the cross-rod between the springs. The body has not only the advantage of the springs, but also of the hinged connection between its supporting rod and the springs.

ANCHOR.—Roh't R. Spedden, Astoria, Oregon. No. 262,254. Dated Aug. 8, 1882. This invention relates to a new and useful improvement in that class of anchors in which an open frame serves as a shank and stock, for the purpose of avoiding sharp points or projecting arms in the construction, being more particularly an improvement upon a certain anchor for which letters patent were issued Feb. 26, 1878. This invention consists in the attachment to the open frame of an anchor similar to the one referred to in the other patent of bars forming a frame which, when in use, may be expanded, and when not in use, may be closed in. The object of the invention is to furnish a stock to an anchor which shall have no projecting points to foul the cable, and which, when in use, will have sufficient width to answer all the purposes of the ordinary stock, and when not in use, may be so folded or closed as to occupy but little space when stowed.

CANISTER.—John H. Tingman, S. F., assignor to A. Schilling & Co., S. F. Dated August 8, 1882. No. 262,259. This is an improved containing canister, which is principally useful for coffee, spices, teas and other dry substances. To introduce the substance and provide a convenient spout for pouring out the contents, an opening is formed in one corner of the top, two of its sides corresponding with the sides of the can or vessel, while the other side may be curved, the corner, or angle, being the center about which the curve is formed. A suitably shaped plate covers this opening. This plate is formed in a peculiar and ingenious manner, which serves the purpose admirably. The whole can is very well adapted for holding dry substances, and is largely used by the manufacturers, Schilling & Co., of this city.

HEADER BAR.—Geo. B. Vroman, Oakdale. No. 262,262. Dated August 8, 1882. This is a new and useful header bar for harvesters, and it consists in a means for receiving the fingers, whereby they may be easily inserted or removed. More particularly, these means consist in the combination with a horizontal projecting top plate of an underlying channel-shaped plate, provided with notches on its edges through which the shanks of the fingers are inserted. The lower plate is drawn to the upper by means of bolts passing through both. This secures the fingers between the two easily and effectively; the object is to provide a means for securing the header bar in such a manner that they may be easily inserted and as readily removed.

SULKY HARROW.—John W. Rush, Stockton, No. 261,386. Dated July 18th, 1882: This invention has relation to that class of wheeled harrows in which the teeth are secured to rocking shafts or bars, by the movement of which the toeth are thrown out or in the ground. The improvements of this invention consist in a convenient and simple manner of journalizing the rocking bars and in their location with regard to ths frame of the harrow. A second improvement is in the construction of the rocking bars, they being made of two parallel-spaced strips, between which the teeth are suitably secured. This construction affords a simple and efficient means for securing the teeth which are set at an angle, and which may be easily removed when necessary. The simplicity and cheapness, together with the effectiveness of the whole device, constitute its merits.

INCUBATOR.—James M. Halsted, assignor to Kate K. Halsted, Oakland. No. 262,407. Dated Aug. 8, 1882. This covers certain improvements in the construction and arrangement of the entire device, having in view its simplicity and economy.

News In Brief.

A TWO-POUND oyster is on exhibition at Marshfield, Coos county, Oregon.

WASHOE CITY, once one of the liveliest towns in Nevada, is now completely deserted.

THE contract has been let for a bridge across Big river, Mendocino county, for $4,949.

SOME banks of snow are still to be seen about the summits of the mountains west of Lake Tahoe, and up in the neighborhood of Ruhicon springs.

CALIFORNIA'S Commissioner, Mr. Ewer, arrived at Denver Saturday evening. He expressed his unqualified admiration for the collection of ores on exhibition.

THE Northern Pacific Railway Co. has completed two additional sections of its road. One is in Idaho and the other in Montana. The two sections cover about 140 miles.

A DISPATCH from Jamaica says that Westgate, the self-confessed assassin of Lord Frederick Cavendish and Burke, has arrived there, and the evidence implicating him in the crime is strong.

WALLA WALLA is fast building up. There are now several large business blocks going up. Grain is ponring into the depot very lively, and busy times are confidently expected after harvest.

THE Cheney (W. T.) *Sentinel* says: The first installment of the Great Western colony, under the presidency of Dr. Hoyt, of Orleans, Neb., has arrived in Cheney. The party numbers over 200.

THE footings of the school census show the population of Chicago, not including sailors, to be 562,000; including sailors, who are a difficult class to enumerate, the population will be nearly 575,000.

FROM a single grain of wheat sown on McKinney's ground, on the east side of the Powder river, near Baker City, grew 73 stalks, each nearly four feet in length and the whole containing 4,380 grains of wheat.

HEAVY rains and several washouts on the Sonora railroad were reported at Tucson on Monday. A heavy thunder and rain storm passed over the southern portion of Arizona Monday night. Several washouts are reported, both east and west, on the Southern Pacific railroad.

PROF. FORBES, who looks after the bugs of Illinois, claims to have discovered a certain eradicator of the terrible *rhyparochromus devastator*, or chinch bug, which often desolates wheat and corn fields. His remedy is a mixture of water, kerosene and milk, which costs about half a cent a gallon. There must be precious little milk in it at that price.

International Exhibition at Amsterdam in 1883.

Some months ago we announced this Exhibition placed under the high patronage of H. M. King of the Netherlands, William, III.

Upon the official invitation of the Dutch Government, the foreign powers, as also the United States, have given their entire adhesion to this undertaking.

One of the greatest Colonial Powers in the world has had the courage to arrange for a great Colonial International Exhibition, something which up to the present, no other nation has done.

His Excellency the Minister of the Colonies is the President of Honor of the Exhibition; enough to indicate the value and importance which will be attached to the principal and fundamental part of the Exhibition.

Let us pass to the second part of it—that has a character especially interesting for us, after out brilliant successes at Paris and elsewhere. After having astonished the world with the marvelous progress of our industry, after having from abroad imported the secrets of invention, we have transformed and perfected the old proceedings, so that now we conquer the most important markets of Europe.

Our powerful production has already found very important outlets, and we are to be careful to maintain our rank, to extend our relations, and to spread the articles of our manufacture.

Amsterdam is one of the most important commercial centers in Europe, and it seems to us that in this point of view America ought to be especially interested to participate largely in the second section of this Exposition.

The Old World envies us, and is jealous of the practical side of our character. Let us show her once more that we neglect no occasion to sustain competition and to penetrate to her very heart—to take these our products which have so often before carried away the victory.

Our government is taking the necessary measures, and the Consuls of the Netherlands have all information at the disposition of those interested.

Promptnese Displayed, Etc.

MESSRS. DEWEY & Co., Patent Agents:—The Canadian patent obtained through you is at hand. This makes three patents received within a month. The ability, energy and promptness displayed by your firm must certainly be gratifying to your numerous patrons—as it assuredly is to

Yours respectfully,
THORPE & BELLOLI.

Agents Now Wanted.

Extra inducements will be offered for a few active canvassers, who will give their whole attention (for a while at least) to our business. Apply soon, or address this office, giving address, age, experience and reference.

DEWEY & CO., Publishers,
No. 252 Market St., S. F.

For Sale.

A twenty-stamp steam mill, complete and almost new. Also, air compressors, drills and mining machinery. Anyone having a gold or silver mine warranting the investment, may buy this material on time by making monthly or quarterly payments. Address, CHARLES E. SHERMAN, Havilah, Kern County, Cal.

Back Numbers Wanted.

We will pay 10 cents a copy for the following numbers of the MINING AND SCIENTIFIC PRESS: Volume, 13; year, 1866; number, 1. Volume, 18; year, 1869; number, 5. Volume, 20; year, 1870; numbers, 1 and 26. Volume, 22; year, 1871; number, 1. Volume, 30; year, 1875; numbers, 2, 3, 4, 7, 10, 11, 12, 13 and 15.

DEWEY & CO.,

Mining and Other Companies.

Persone interested in incorporations will do well to recommend the publication of the official notices of their companies in this paper, as the cheapest appropriate medium for advertising.

Bullion Silver Mining Company.—Location of principal place of business, San Francisco, California; location of works, Gold Hill Mining District, Storey County, Nevada.

Notice is hereby given that, at a meeting of the Board of Directors, held on the first day of August, 1882, an assessment (No. 25) of Fifty (50c) Cents per share was levied upon the capital stock of the corporation, payable immediately, in United States gold coin, to the Secretary, at the office of the Company, Room 3, No. 328 Montgomery street, San Francisco, Cal.

Any stock upon which this assessment shall remain unpaid on the fifth day of September, 1882, will be delinquent, and advertised for sale at public auction; and, unless payment is made before, will be sold on WEDNESDAY, the 27th day of September, 1882, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Directors.

J. M. BRAZELL, Sec'y.

OFFICE—Room 3, No. 328 Montgomery street, San Francisco, California.

DIVIDEND NOTICE.

OFFICE OF THE

Northern Belle Mill & Mining Company.

San Francisco, August 10th, 1882.

At a meeting of the Board of Directors of the above-named Company, held this day, Dividend No. 63, of fifty cents (50c) per share, was declared, payable on TUESDAY, August 15, 1882. Transfer books close on Friday, August 11, 1882, at 3 o'clock, P. M.

WM. WILLIS, Secretary.

Office—Room No. 29 Nevada Block, No. 309 Montgomery Street, San Francisco, Cal.

DELINQUENT SALE NOTICE.

Thor and Bright Point Mining Company.

Location of principal place of business, San Francisco, California. Location of works, Big Cottonwood Mining district, Salt Lake county, Utah Territory.

NOTICE—There are delinquent upon the following-described stock, on account of assessment (No. 1), levied on the 6th day of July, 1882, the several amounts set opposite the names of the respective shareholders, as follows:

AIR COMPRESSORS

Mining Machinery.

For Catalogues, Estimates, Etc, address

Berry & Place Machine Company,

PARKE & LACY, Proprietors.

323 & 325 MARKET ST., SAN FRANCISCO.

GIANT POWDER.

MANUFACTURED UNDER ALFRED NOBEL'S ORIGINAL AND ONLY VALID PATENT FOR NITRO-GLYCERINE POWDERS.

All Nitro-Glycerine Compounds, for instance, so-called HERCULES, VULCAN, VIGORIT, NITRO-SAFETY Powder, Etc., are infringements on the Giant Powder Co.'s Patents.

THE GIANT POWDER COMPANY

Call Special Attention to their Improved Grades of Powder.

NO. 1.—The most Powerful Explosive Compound now in use here.
NO. 2.—Surpasses in strength any Powder of its class ever manufactured.
NO. 3.—This grade is a Strong and Reliable Powder, which does excellent work.

JUDSON POWDER

Is now used in all large Hydraulic Claims, and on most Railroads. It breaks much more ground, and obviates reblasting by breaking much finer. TRIPLE FORCE CAPS AND ALL GRADES OF FUSE.

☞The Giant Powder Company have also purchased from Mr Nobel, the inventor of Nitro-Glycerine, his latest invention, known under the name of **Nobel's Explosive Gelatine.** This explosive is from 50% to 60% stronger than the strongest Nitro Glycerine Compound and impervious to water. Even hot water does not diminish its strength. We are now introducing the same

RANDMANN, NIELSEN & CO., General Agents, 210 Front St., S. F.

NEW YORK REFINING COMPANY'S

STANDARD COMPOUND

Machinery and Shafting Lubricants!

FINE CYLINDER AND MACHINERY OILS.

Brass, Copper and Zinc Lubricant Cups, New York Refining Co.'s Standard Axle Grease.

Carriage Lubricant and Leather Preservative; Skid, Gear, Belt, Elevator and Wire-Rope Grease, Car Journal Lubricant, Waste and Steam Packing, Sight Feed Cylinder Lubricators.

EDWARD B. READ, Sole Agent,

Rooms 11 and 13, 419 California St., San Francisco, Cal.

Lane's Mineral Springs,

CALAVERAS COUNTY, CAL.

Pine and Hemlock Chemical-Vapor and Electro-Thermal Baths.

Connected with these Springs are Hot and Cold Baths. The Water of these Springs is Cold, Clear and Palatable, having been used 20 years for Medical purposes.

These Fountains of Health are located 35 miles east of Stockton, in the foothills of the Sierras; at an altitude of 1,000 feet above the level of the sea. Always ready, Winter and Summer, for the reception of patients, on account of the even temperature of this most genial climate.

The accommodations consist of a Hotel, Cottages, Camp Grounds and Stables.

Stage leaves Commercial Hotel, Stockton, at 7 A. M., Tuesdays and Saturdays.

P. O. Address, Knight's Ferry, Stanislaus Co., Cal.

JAMES HUTCHINS, Proprietor.

California Inventors

Should consult DEWEY & CO., AMERICAN AND FOREIGN PATENT SOLICITORS, for obtaining Patents and Caveats. Established in 1860. Their long experience as journalists and large practice as patent attorneys enables them to offer Pacific Coast inventors far better service than they can obtain elsewhere. Send for free circulars of information. Office of the MINING AND SCIENTIFIC PRESS and PACIFIC RURAL PRESS, No. 252 Market St., S. F. Elevator, 12 Front St.

Mining Books.

Orders for Mining and Scientific Books in general will be supplied through this office at published rates.

BY TELEPHONE.—Subscribers, advertisers and other patrons of this office can address orders, or make appointments with the proprietors or agents by telephone, as we are connected with the central system in San Francisco.

Iron and Machine Works.

GLOBE IRON WORKS,

Manufacturere and Repairers of all kinds of

MACHINERY AND IRON CASTINGS,

Hoisting and Mining Machinery,

Portable, Stationary and Marine Engines. Bishop's Mining Pump Apparatus and C. H. Baker'e New Mining Horse-Power a specialty.

Also

L. D. LOUNT'S PATENT AIR COMPRESSORS.

222 & 224 Fremont Street, San Francisco.
Between Howard and Folsom.

Oakland Iron Works.

We are now prepared to do all kinds of

Heavy and Light Castings and Machinery,

Marine and Stationery Engines, Rock Breakers, Stamp Mills, Pumping Machinery, Donkey Engines, etc.

Good Facilities for Shipping on Cars.

Works Located Cor. Second and Jefferson Streets, Oakland.

PATTEN'S CONCENTRATOR.

This machine requires less power, less care or attention, and is less liable to get out of repair than any concentrator now in use. All of which any practical miner will comprehend when seeing it in operation.

The wear and tear is nominal, and the construction so simple that any miner can put it up and run it; and the low price brings it within the reach of all mill men, as it will save enough to pay for itself in any mill in very short time. One machine will concentrate the tailings from a five-stamp battery.

VIGORIT POWDER.

NO ACCIDENT HAS EVER HAPPENED.

ALL POWDERS manufactured by the California Vigorit Powder Co. are SUBMITTED during the course of manufacture TO SCIENTIFIC and accurate TESTS for safety and strength.

They are tested for Safety against Friction, Fire, a Temperature of 212° Fahr., and the various shocks to which Powder is liable in practical handling.

The following qualities are common to all grades of Powder manufactured by the Company:

Safety, Non-Leakage; Freedom from Noxious Gases; Uniformity and Strength.

If consumers desire it, the EXACT STRENGTH of any Powder shipped to them will be GIVEN IN FOOT POUNDS.
☞ Send for Pamphlet showing methods of testing the different qualities of all Powders.
The Company manufactures

DETONITE.

This is an explosive involving new principles and recently patented. It is the **Strongest Powder ever placed on the Market,** in this country or abroad. It is the **Safest Strong Powder ever made.** For very refractory rock this Powder is the most economical in the market.

VIGORIT, No. 1, XX.

This Powder is **Stronger than the Highest Grades of Hercules or Giant.** It is only surpassed by "Detonite." t is suitable for hard rock.

VIGORIT, No. 1.

For general work this Powder has no superior. It has the advantage over Giant, Hercules or Vulcan in safety and freedom from noxious fumes.

VIGORIT, No. 2.

Equal to any corresponding Grade in the Market.

LOW POWDER.

VIGORIT, L. P.

This is a Powder suitable for **Bank Blasting, Log Splitting** or the work generally in which Black Powder can be used. It is STRONGER THAN BLACK POWDER, having from twice to ten times the effective strength, depending on resistance. It is **Superior to Judson Powder,** in being more sensitive to the cap and more convenient in handling.

Best Qualities of FUSE and CAPS sold at Lowest Rates.

MINING AND SCIENTIFIC PRESS.

An Illustrated Journal of Mining, Popular Science and General News.

BY DEWEY & CO., Publishers. SAN FRANCISCO, SATURDAY, AUGUST 26, 1882. VOLUME XLV Number 9

Handling Coal.

The Works of the Oregon Improvement Company.

The handling of freight, coal, etc., along our city front is still done, as a general thing, in a way that is wasteful of labor and expensive, and in the coal business particularly is this very noticeable. Cargoes of coal are discharged and hauled by wagons to yards at a distance, there piled up, and when wanted by retailers is shoveled again into wagons and taken to the yards. There it is again dumped, and then shoveled again into wagons for delivery. Coal is wasted and broken, and the handling adds to the price each time.

The only place on the city front where the handling of coal is done in a systematic, scientific manner is at the wharves and yards of the Oregon Improvement Co., where the Seattle coal is received. There everything is so arranged as to prevent the coal from being broken up, and also so as to save all possible labor in handling it. A recent visit to this place developed some points which will be of interest to those who have no opportunity of observation.

The mines from which this Seattle coal is taken are 20 miles east of Seattle, W. T., and the coal property comprises some 1,200 acres, containing five veins of coal, varying in thickness from 5 to 10½ ft. The present capacity of the mine is 1,000 tons of coal per day, but it is not working up to its capacity, owing to the heavy importation of coal from Australia and Great Britain. Owing to our large wheat exports, a fleet of ships comes here every season for wheat cargoes. They bring coal ballast when they come, and can, therefore, take it at a very low rate. During the last two years the amount of coal brought under these circumstances has been very large, and prices have been correspondingly low in this market. This has, of course, affected the mines on this coast. It is stated that if the low prices are maintained, the importation of foreign coals will decrease, as, even when brought at very small freight charges, it will not pay to ship here. The coal from the Seattle mine is brought down over the Columbia & Puget Sound narrow-gauge railroad from Newcastle to Seattle, where a wharf has been built by the Oregon Improvement Company, at a cost of $40,000. This wharf is 1,200 ft. long, 50 ft. wide, and is built on piles, each of which is sheathed with copper to protect it from the ravages of the teredo, which is much more destructive in Puget Sound than it is in this harbor. This coal pier has on each side "pockets" with a combined storage capacity of 1,500 tons. These pockets or bins are filled during the absence of vessels, so as to keep the railroad and mine working regularly, and to store up coal at the shipping point so the vessels may be rapidly loaded.

The company owns four fine iron freight steamers which are engaged in transporting the coal. The *Willamette* carries 2,500 tons; the *Umatilla* and *Walla Walla* each carry 2,000 tons, and the *Mississippi* carries 1,000 tons.

The large vessels are built after the most approved style, with every facility for handy and economical work. They are equipped with high power for speed. The *Willamette*, with her cargo of 2,000 tons and her fuel, has made the run in 69 hours from Seattle to San Francisco, which is an average run of 12½ knots per hour—a very high speed for freight steamers.

It is at the wharves at San Francisco that the company have made the improvements that we more particularly desire to refer to. Here they have arranged everything in a very systematic manner, which shows experience and an attention to detail somewhat refreshing to meet.

The large storage sheds are situated about 100 ft. back from the slip, and are 264 ft. by 100. The wharf is 900 ft. long, 500 of which is devoted to the coal steamship berth. Here the large steamers are moored in suitable position with relation to the hoisting towers, so that all work will go on smoothly.

There are four of these hoisting towers, and they are placed so as to be exactly opposite the four hatches of the steamers. The steamer herself furnishes no part of the discharging gear. Each hoisting tower has a set of movable shears that are dropped out so that the top is vertically over the center of the hatch. The hoisting engines are of the frictional-gear pattern, and were made in the East. The tubs hold about half a ton, and are hoisted very rapidly—about seven feet a second. It is a common thing, with the appliances at command, to discharge 1,000 tons of coal per day from these steamers. During a visit this week, while the steamer *Willamette* was being unloaded, the work was going on at this rate.

After the coal is hoisted to the towers, the tubs are dumped, the coal falling into large hand-barrows holding some 1,300 lbs. each, and they are run along the platform, which is 25 ft. above the wharf level. The platform is on a level with the top of the "pockets."

These pockets are bins, with inclined floors leading to openings or chutes, by which they are discharged. The pockets extend clear around the large building. When filled they are emptied by means of gates, of which there are 44 in all. When a gate is lifted, the coal slides down over a screen, and the finer coal falls through and returns inside the building on to the floor, the clean coal going into the wagon. The storage capacity of the pockets is 2,500 tons, and with them 1,000 tons of coal per day can be delivered without labor.

The main building inclosed by the pockets holds 7,500 tons of coal. These works are devoted entirely to Seattle coal. The company owns the railroad, steamships and real estate, so that the facilities were arranged with a view of economizing labor and wastage.

In the rear of the coal sheds is an immense coal yard, having a storage capacity of about 50,000 tons. In this is now stored Lehigh lump, anthracite egg, blacksmiths' and foreign steam coals, of which the company intends keeping a large supply, so as to be able to meet any possible demand which may be made.

The company is now building opposite the city of Portland, Oregon, large coal pockets, which will receive coal directly from steamships, and from which it can be loaded into cars, locomotive tenders, ocean steamers, river steamers, boats and barges, or for town consumption. She is towed to Oakland, and the coal is hoisted into the pockets, where it discharges into the carts by gravitation. This barge discharges 325 tons of coal in 10 hours.

The real estate of this company is comprised in two large lots at the foot of Beale street, 575x250 each, one of which is entirely devoted to the coal business. Around the main building a string of carts is constantly passing, being loaded at the chutes, no shoveling or labor of any kind being necessary. When the building is filled, if necessary, elevators take the coal up to the huge bins, ready to be automatically discharged into the wagons.

This company has the advantage of the 16 years' experience of its manager, Mr. J. L. Howard, under whose personal direction and supervision the works have been planned and perfected. The company itself has shown great enterprise in carrying out such a system of works in so thorough a manner. They are the only ones of the kind for the economical handling and storage of coal that have been put up here. It may be of interest to note the prices of the coal at the yard. The Seattle, clean, is sold for $6; average coast coal, $5; nut, or steam, $4.75; screenings, $4, on the wharf. As might be expected, this company is doing a very large business, which, with the new arrangements at Portland, will be greatly increased.

State Minerals Not Removable.

It will be remembered that before the opening of the Denver exposition, Mr. Ewer, the California Commissioner, endeavored to obtain here funds to enable him to take the collection of the State Mining Bureau to Colorado, and there exhibit it. The Governor of the State was willing to authorize the State Mineralogist to allow the collection to go, provided there were no legal obstacles. A letter was addressed to the Attorney-General, asking his opinion, and the Commissioner waited several days in the hope it would be favorable. Now the opinion has been received, and it is unfavorable. However, the intended arrangement had been abandoned some time since, and the Commissioner is at Denver. The opinion will serve as precedent, however, and we herewith give it:

W. B. Ewer, Commissioner to Denver Exposition, S. F., Cal.:—DEAR SIR: After considering the contents of your letter of the 3d inst., and upon examining the "act" to provide for the establishment and maintenance of a Mining Bureau, passed April 16, 1880, I am of opinion that the Governor has no control over the specimens and ores in the Mineralogical Bureau, and that, therefore, permission received from him to remove the specimens, for the purpose of placing them on exhibition at the Denver exposition, would not add anything to the authority of the State Mineralogist.

The geological and mineralogical specimens which have been collected by or under the direction of the State Mineralogist are in his charge, and if he causes them to be removed from the State, he will be responsible for their safe return.

I regret that I am unable to find any statute authorizing the removal of these specimens. The State Mineralogist, being a statutory officer, has no authority in excess of that conferred upon him by the statute creating the office and prescribing his duties.

The benefits to the State from a proper exhibition of her minerals at the Denver exposition would be so great that it will be a matter much to be regretted if we are not represented there. I have the honor to remain your obedient servant, A. L. HART, Att'y General.

Sacramento, Cal., Aug. 17, 1882.

The Mining Exposition.

In another column is given the second letter from the California Commissioner to Denver, and our readers will do well to follow closely the series of letters, containing as they do so much information. Mr. Ewer is endeavoring to collect for California all that is available for our use. The attendance at the exposition has not been as great as was hoped for, but the management is trying to remedy this. Arrangements have been made for special excursion parties from the various States, counties, mining districts and towns. Parties representing the various localities, in concert with the managers of the exposition and the railroad authorities, will fix upon a given day when excursion parties may purchase tickets at about one-third discount from regular fares, good for a reasonable length of time, during which some one day will be set apart as a special day, to be known as Utah day, Arizona day, Leadville day, Gunnison day, etc. There will be probably some 15 or 20 such days.

Our Commissioner acknowledges the friendly manner in which he has been received, and the many attentions which have been shown him by both the management of the exposition and by the press of the city. Mr. S. T. Armstrong, Secretary; Capt. Frank H. Wilson, Assistant; W. A. H. Loveland, General Manager, and Mr. E. B. Gordon, Chief of the Literary Bureau, and correspondent of the San Francisco *Chronicle*, as well as many other officers, and all the employes are untiring in their efforts to make everything pleasant and agreeable on the part of visitors and exhibitors. The secretary's office is connected by telegraph or telephone with every part of the outside world. The exposition building, as the engraving shows, is constructed in the Renaissance style of architecture, and presents a really beautiful appearance, with its flags of all nations flying from its numerous towers and minarets. It is in the form of a Grecian, and not a Roman cross, as has been inadvertently stated. The long arm of the cross is 500 ft. by 120 in width; the short arm 310 ft. long and of the same width, giving a floor space on the ground of 82,480 ft. To this should be added the gallery space of 34,290 ft., making in all a total of about 120,000 ft. of floor space. It has been constructed by an association, in a substantial and permanent manner, occupying, with its annexes now existing and to be constructed, the central position of a 40-acre lot, which will be fitted up as a park. Underground pipes have already been distributed thereabout the entire area for irrigation purposes.

THE DENVER MINING AND INDUSTRIAL EXPOSITION BUILDING.

Although the present is largely, and we may say chiefly an industrial exhibit, it is the intention of the management to make it hereafter essentially a mineral exhibition. Those interested in mines, outside of Colorado, were so slow in making applications for space, and manufacturers and traders, both in Colorado and at the East, so very clamorous for space, that the latter succeeded in securing much the larger amount; and when the mineral boom was finally started there was not room enough to accommodate that class of exhibitors. Of course some ill-feeling was indulged in at first, but the matter has now settled down into quiet, with the understanding that the miners will hereafter have all the show they require—annexes to be put up, as far as necessary, for other exhibits. It is proposed that the mineral exhibit shall be a permanent one, to be open all the year round, with special additions and a special show during the months of August and September of each year. Most of the minerals, stands and cases now there will be left permanently in the building.

THERE are nine cases of leprosy in the San Francisco pest-house, but no small-pox.

Pacific Coast Mines in France.

Persons who have for sale good mines in California, Arizona and New Mexico will find that the large banks and moneyed syndicates of France, and more especially Paris, look with favorable eyes upon such investments. They are cautious and not easy to deceive, but when convinced that there is merit in a mine, do not hesitate to take speculative risks. It is no new thing for the Parisians to speculate in California and Mexican mines, as the following will show. It is composed of extracts from a letter written by Theodore Murtal, of Paris, to Mr. Jules P. Cavallier, President of the Justice and Woodville Con. mining companies, of this city, and son of the late J. B. E. Cavallier, the first president of the San Francisco Stock and Exchange Board, who died in Paris on July 11th.

There is the best of feeling here in financial circles respecting really good mining property in California, Arizona and New Mexico. Much of this is due to the class of property introduced to this center by your late lamented father, J. B. E. Cavallier. By his energy, intelligence and influential connections, he was at the time of his death fast succeeding in opening, in Paris, a mining business of colossal proportions. Much of his business was known to me, and I will endeavor to give you an outline of how it was progressing at the time of his decease:

He was engaged in conducting the final negotiations, for Mr. Martin, for the sale of the Copper Queen mine. He had just secured the acceptance of Professor Clarence King's terms for the sale of the Yedra mine, in Mexico, conditionally upon the verification of the Professor's report upon the condition of the mine, the assays having all been found as reported, and most satisfactory.

The sale of the San Anastasio mine, Chihuahua, represented here by Dr. W. W. Bowlby, of New York, and recently examined by N. J. Colman, of San Francisco, for the French syndicate which has secured his services, is in a fair way of being closed at rates proposed by the vendors. He was also conducting negotiations with Augustus Taylor, of New York, representing the Copper Mountain mine, of Arizona, and with Mr. Cumenge, Professor of Mineralogy at the Mining School in Paris. The Ortiz grant, of New Mexico, composed of gravel mines and coal deposits, was also in his hands, and he had just commenced to devote his attention to a study of the character of the property when death called him away.

You will see by this that the French are coming to the front as buyers of mines; and let me say, that the bigger the mine, the easier it is sold here. Reports are of no value in this market, unless the material is in the mine to justify them; and the success of your father in his recent negotiations, some of which have been closed since his death, is in no small measure due to his personal honor, which made to him impossible the slightest exaggeration. The Pacific States may justly deplore his death, for he was not only their pioneer in the French markets, but was in every respect a worthy representative of your vigorous and enterprising people. Sincerely yours, THEODORE MURTAL.

To J. P. Cavallier. Paris, July 25, 1882.

The State Bag Factory.

The reporters of the daily papers are giving due attention to the State bag factory at San Quentin, and readers are duly assured of the full success of the enterprise. The building cost $45,000, the machinery $105,000, and the whole was put in complete running order for $184,000, and with the balance of the appropriation 480 tons of jute were purchased. Now at San Quentin State prison cloth is woven daily by the convicts, with a few freemen as superintendents, sufficient to make 7,200 grain bags, and these have been sold at 8½ and 9 cents per bag. The demand for them cannot be supplied. And these bags have not been disposed of to traders, but directly to farmers. The first lot was sold at 8½c., mainly to Arizona, because they were not in quality up to the standard, but now the price is 9 cents—and it will not be raised, for this institution is not a speculative one. It was established to give work to prisoners, and to supply a public need. There can be no more corners in grain bags, for the 8,000 bags a day, which henceforth will be turned out of San Quentin, will be sufficient to prevent the speculators from venturing on such dangerous course, hence the price of bags will be kept at the lowest rate, and all this will insure to the great benefit of the farmers. These San Quentin bags have been examined by experts and pronounced of a superior quality. The Warden, Judge Ames, is not, however, in his jute factory confined to grain bags, as he weaves cloth for hop packing, for ore bags, for wool sacks, etc., and makes twine to sew them with. This is probably the best investment that the State ever made. It is practicable and profitable—first, in making the prisoners earn their living, and second, by furnishing the farmers with good bags at a just price, and thus preventing the dealers from charging them unconscionable rates.

PROF. MARIA MITCHELL, the astronomer of Vassar, has reached her 63d year. She has almost perfect health, and is as vigorous as ever.

Proverbial Wisdom on the Weather.

Much wisdom on all subjects pertaining to human life, and to the conditions and phenomena of nature, are concentrated into proverbs. Popular errors of experience and observation also find their way into apothegms, and yet it cannot be doubted that the majority of proverbial sayings contain an element of living truth, as gained by the eye or the mind. They are the concentrated wisdom of the ages, and are found in all languages, and have descended from the earliest times.

The aggregation of conditions and phenomena known as "the weather" has occupied the minds and tongues of men, probably, since the very wet year which floated Noah to the top of Ararat, and the centuries of observation have given a host of weather proverbs and proverbial data for prognostication. It has occurred to Gen. Hazen, Chief Officer U. S. Signal Service, to collect as many as possible of these proverbs and wise sayings, that they may be classified and compared, and the weight of testimony in them compared with the facts of modern meteorological observation. It is a happy idea to collect this concentrated wisdom from a world of observers, and it seems likely that much interesting and valuable testimony on weather behavior may be gained. In order to secure this information, Gen. Hazen has issued a circular, arranged so that proverbs of different kinds may be stated by his correspondents under proper heads. We trust his effort to collect them may receive the co-operation of the weather-wise. On this coast, where conditions are so different from those which prevail in the older proverb-making countries, it is found that much of the old wisdom is folly; but if one is disposed to research, and has the opportunity to pierce the darkness of the aborigines, or to glean the wisdom of the early white settlers, perhaps something true to our conditions may be drawn out.

That our readers may perceive the nature of the inquiry to be made and the scope thereof, we shall quote the headings under which Gen. Hazen asks responses. If any reader will favor me with his proverbial treasures, we will see that they are duly forwarded to Gen. Hazen at Washington. It is desired that the origin of any proverb may be given with it when possible:

1. Proverbs relating to the sun.
2. Proverbs relating to the moon. (New moon, change of moon, halo around the moon, influence of moon on agricultural operations, change of moon on days of week, etc.)
3. Proverbs relating to stars and meteors.
4. Proverbs relating to rainbows.
5. Proverbs relating to mist and fog.
6. Proverbs relating to dew.
7. Proverbs relating to clouds.
8. Proverbs relating to frost.
9. Proverbs relating to snow.
10. Proverbs relating to rain. (Morning, midnight, rain from particular quarter, rain during squalls.)
11. Proverbs relating to thunder and lightning. (First thunder in the year, thunder from the west, north, east, south; lightning, west, north, northwest, south, southwest and east.)
12. Proverbs relating to winds. (Day, night, morning, evening, wind and rain, wind preceding fair weather, cold winds, direction of winds, north wind, northeast wind, northwest wind, south wind, east wind, west winds, wet wind, veering winds, backing winds.)
13. Prognostics from the actions of animals. (Bats, oxen, cats, dogs, goats, bares, rabbits, horses, mice, moles, pigs, rats, sheep, weasels, wolves, frogs.)
14. Prognostics from birds. (Blackbirds, cranes, cuckoos, ducks, finches, fowls, chickens, geese, guinea-fowl, gulls, kingfishers, kites, larks, migratory birds, owls, peacocks, pigeons, quails, robins, rooks, snipe, sparrows, swallows, swans, thrushes, wild geese, woodpeckers, wrens.)
15. Prognostics from fish. (Carp, dolphin, pike, porpoise, trout, shad, herring, mackerel, cod, blue-fish, lobsters, crabs.)
16. Prognostics from reptiles. (Frogs, glow-worms, leeches, snails, snakes, toads, worms.)
17. Prognostics from insects. (Ants, bees, beetles, crickets, flies, gnats, lady-birds, spiders, wasps.)
18. Prognostics from trees, plants, etc. (Brambles, brooms, chickweed, clover, colt's-foot, dandelions, ferns, fir cones, hawthorn, marigolds, mushrooms, oaks, onions, pear, apple, roses, seaweed, sensitive plants, thistles, walnuts, wood sorrel, chaff, leaves, etc.)
19. Prognostics of the weather, drawn from various objects. (Chairs, tables cracked before rain, etc., coals burning brightly, corns, ditches, doors, dust, lamps, rheumatism, salt, seed, sign-boards, smoke, soup, sound, strings, toothache, walls.)
20. Proverbs relating to days of the week. (Weather and agricultural rules.)
21. Proverbs relating to each month of the year. (January, February, March, etc.)
22. Proverbs relating to the seasons of the year. (Spring, autumn, etc.)
23. Proverbs of weather relating to the year.
24. Proverbs of weather and popular sayings relating thereto, not included in the answers to the above questions.

TO PREVENT FERMENTATION.—Science never stays its progress. Nearly every day of the year it adds some scrap of information to the great volume of human enlightenment. One of its quite recent triumphs is the discovery that fermentation can be prevented and arrested by the use of salicylic acid. One ounce, it is said, added to 40 gallons of sweet cider, will make the yeast settle and the cider become perfectly clear in 48 hours. If it is then drawn off into other barrels or bottles, it will remain sweet and clear for an indefinite length of time. It has been a question with our horticulturists what to do with their superabundance of fruit, much of which has hitherto gone to loss. Under this process, grapes and apples can both be worked up, and the resultant juices either be put upon the market or consumed in the family as beverages, free from intoxicating effects.

THE Narrow Gauge group of mines, Wood River, lately sold for $80,000, and is to be developed at once by a large force of men.

Forest Trees of California.*

Incense Cedar—(Libocedrus Decurrens.)

This great cedar of our coast and mountains is remarkable for its super-eminent use, beauty, precision and aspiring grandeur. Devoted to the conic plan, few diverted limbs ever spread afar to mar the general purpose. Elegant and upright in early life, it becomes at length grand and dignified with age. It is also eminently noted for great rapidity of growth, wonderful lightness, stiffness and extraordinary durability; in short, a thousand uses have sprung up and are multiplying around this interesting cedar as its most inestimable qualities become better known. Fortunately for us, it is one of the most extensively distributed trees of the Pacific—found from the Coast range north, south to San Diego, Sierra Nevada, southern Oregon, and most of the interior mountain region from 2,000 to 4,000 ft., and even thrives quite well at 6,600 ft. altitude; and, so far as we have observed, seems to give out at 7,000 ft., though said to extend to 8,500 (?). As usual with our sylva, flora and fauna, this also is found lowest along the coast, where it finds the requisite temperature, etc., with combined moisture. The base and lower trunk somewhat resembles the Western juniper (*J. occidentalis*). It is to be noted in general, that trees of such broad, outwardly sweeping, or expanded bases seldom blow over, and to the perceptive and artistic eye their significant expression is one of firmness and stability. One hundred to 200 feet high, six to nine feet in diameter (rarely larger), the shaft is often clear of limbs 80 to 100 feet, and although the lower limbs, or even dry branches, may encumber the middle portion, pin-knots do not damage the timber. As the massive body tapers more rapidly above than redwood, and is less eccentric than juniper, nevertheless its general port reminds one most of the best specimens of the latter. The light cinnamon bark is thick, of shreddy-fibered texture, but so concretely compacted as to render the surface evenly ridged by very long, big bare of bark. These sweep obliquely down on the long spiral twist of swift water lines, which gives it the expression of deep, determined currents, and adds to dignity decision and force of character. Top conic; the foliage, closely viewed, is in compressed, flattened sprays, aspiring and upright, thickened, and somewhat succulent, or luxuriously tender; if not a languid type, at least in no sense rigid; not thrillingly sensitive to the breezes, but concurrently moving in masses; bears some resemblance to the great Western arborvitæ (*Thuja gigantea*), but these tiny leaf-scales are opposite and quite awl-pointed; besides, the close-pressed adherent base runs far down along the twige below the free tips. The general hue of the foliage is light yellowish green, warm tinted, beautifully golden, head-tipped, with tiny, oblong male catkins, as the fruit ripens in October and November. The cones are pendulous from the tips of twigs—oblong, egg-form, of six very unequal scales; two principal ones, or large pair, swelled on the back gradually below, pointed on the back just below the tip; intermediate pair much narrowed; a few bract-like, spine-tipped, short scales under the base. The seeds are oblong, like a grain of rye, two winged—one wing developed to the size of the larger scales, the other at its side, below, and much smaller. The cone is seldom over three quarters of an inch long, little more than one-third as thick, and for the most part a trifle compressed. Wood, pale cream-tinted in color—a delicate salmon shade. This would hardly warrant the name "white cedar," sometimes applied to it, as well as to the giant arborvitæ. The extreme lightness of the lumber and its sweetness for packing-boxes will commend it for express and commercial purposes, for posts and fencing, and especially railway ties, for sleepers, stringers, and ground timbers of all varieties, and for unnumbered uses, a tithe of which cannot be told in this brief notice. Formerly these trees were cut away and burned up, to clear the track for redwood, tamarack, and ponderous pitch-pines, etc.; now all else is superseded by this incense cedar. Thus we see how hasty and ill-advised notions give place to genuine merit.

A fungus (*Dædalus*) attacks and honeycombs it; and riddled as it may occasionally be, still if spike or nail find substance enough to hold, or sufficient solidity to resist crushing, then, practically, for many purposes, even such lumber is as good as the soundest timber; because when the tree dies the fungus dies, and thenceforth will absorb no more moisture than the soundest part, and is alike imperishable, contrary to common experience in similar cases. This is another timber nearly as lasting as solid granite; hence we see how little reliance is to be placed upon ignorant assertions of transient visitors from abroad. For ship or boat lumber, the clear stuff from sound wood is so exceedingly light, stiff and durable, and practically so abounds as to be available, that few timbers on this or any other coast can excel it, unless we except the yellow cedar, or cypress (*Cupressus nutkaensis*), which is a little tougher, stronger, perhaps more elastic, and equally durable, if one may be allowed to judge apart from thorough tests and careful data, which the apathy or ignorance of some governments appear to deem unworthy their sublime attention. There are in California a thousand times more and better kinds of naval timbers on Government lands as important to preserve as the live oaks of the South Atlantic States. It would not in the least surprise me if, after due investigation, California would be found to possess a vast amount of the best naval timber in the world, and a hundred fold more lasting than the best now in use, if we except a few of which there is no adequate supply worth mentioning anywhere.

* From "The Forest Trees of California," by A. Kellogg; published by the State Mining Bureau. State Printing Office, Sacramento, 1882.

The Curse of Drunkenness.

The daily record of events, as set forth in the morning and evening papers, is almost a continuous chain of evil deeds prompted and pursued by those who are maddened by alcoholism. Brutal assaults and cruel murders are almost nightly occurrences. Occasionally, however, there is an inhuman deed which sinks far below the average crime, and seems to open to the view and contemplation the very bottomless pit of human depravity and cruelty. Such was the murder of Mrs. Wilson by her husband, which occurred on Thursday, Aug. 10th. The woman was found dead in her house. The police surgeon who made the examination made the following report:

> The woman had received a terrible beating, and came to her death from inflammation of the brain following the violence. He discovered on the head a severe scalp wound in the shape of a horseshoe, such as might have been produced by the heel of a boot; another scalp wound on the right side of the head above the ear, and three inches in length; a wound a little to the left side of the middle line of the forehead, in the shape of a St. Andrew cross, and the frontal bone laid bare; a wound an inch long at the angle of the right eye, and affecting that organ; a wound an inch and a half long under the right eye, and running toward the upper part of the nose; a wound an inch and three-quarters in length under the right ear; a two-inch wound under the chin; a cut three and a half inches long on the outside of the right leg, between the knee and the ankle; an immense bruise on the left side of the abdomen; a severe bruise on the right side of the abdomen; another under the right nipple, and still another in the upper part of the right side of the chest. Besides these there were a number of contusions on the thighs and back. The surgeon also discovered that there were seven ribs broken, four on the right side and three on the left. The wounds have all the appearance of having been produced by kicks with a heavy boot. The deceased was a woman of medium hight, and well proportioned. Her features show that she was a woman who was addicted to the use of intoxicating liquor.

It has been quite clearly shown that this unfortunate woman came to her death at the hands of her husband, who was also addicted to the use of intoxicating liquor. Their quarrels were a very ordinary sensation in the neighborhood, and the sounds of violence in their home were so common that neighbors did not think of interfering with them.

Here, then, were husband and wife, with a group of children, both of them accustomed to brutalize themselves with liquor, and become common brawlers—carrying on their evil way until finally the husband reduces his wife to a broken and lifeless body, bearing the print of his boot-heels—a helpless drunkard trampled to death by an infuriated drunkard, in the midst of their home and their children.

These are terrible things to think of. We would gladly avoid their contemplation and spare our readers the recital of them; but it is a common duty to bring them forward, that all may see again the demonizing power of strong drink, and shun it as they would a pestilence. Who can indulge with the thought of such events as the direct outcome of indulgence? Let the evil, then, be clearly recognized in all its hideousness, until the one who is disposed to trifle with the evil, or to court its consequences, shall turn from it in horror. There is only one way to be absolutely free from danger, and that is to avoid it; pass not by it; turn from it and flee away, as is the Scriptural injunction.

Agricultural Lands in Arizona.

The Tombstone *Republican* claims that most erroneous and damaging impressions exist abroad in relation to the agricultural and grazing capacity of the southern and eastern portions of Arizona. Men who have read of the Gila and Mohave deserts naturally conclude that those arid plains constitute a large portion of the whole Territory. Nothing, says the *Republican*, could be wider of the mark than such a conclusion. While there are tracts of large extent covered with cacti and prickly brush and insufficiently watered, there are other tracts infinitely larger that are free from all such obstructions, and covered with a thick growth of rich, nutritious, perennial grassee, with either flowing water, springs or subterranean water at from 6 to 50 ft. from the surface. Even much of the brush land is well grassed, with water easily accessible to stock. Notably is such the case for nearly the whole length of the San Pedro river. There are in Cochise county three large valleys, which cover an area of several millions of acres of as fine grazing and agricultural land as can be found in almost any country. These are the San Pedro, Sulphur Springs and San Simon valleys. Independent of these valleys, there are immense tracts of level or gently undulating mesa that skirts the base of the various ranges of mountains in this county, that constitute vast natural pastures and meadows, and which, by the introduction of water for irrigation, are susceptible of the highest state of cultivation and productiveness. That broad belt along the eastern slope of the Huachucas, which extends in unbroken continuity for the whole length of the range, a distance of 25 or 30 miles, is an example of this sort of land. Mowers were run over hundreds of acres of it last year and hundreds of tons of hay put up for winter use.

MECHANICAL PROGRESS.

What Should be Done with a Boiler When Not in Use.

What should be done with a boiler when not in use, or how can it be kept in the best condition when it is not being operated? This depends a good deal on circumstances, and any answer that will apply to one will not apply to all. If you are to stop the boiler for any length of time, there are two things essential to know. If your boiler is situated in a place where it will be dry, and is not in the wheel pit, or where floating moisture or the vapor from water can come in contact with it or moisten the room about it, then the boiler should be blown off, and right here stick a pin; we do not mean blown off at 60 or 80 lbs. pressure. Many a boiler has been ruined the first time it was blown off. Draw your fires, no matter what the pressure may be, and leave the boiler for half an hour or an hour—two or three hours is better—let the pressure gradually drop to at least 25 lbs., but 20 is still better. When you commence to blow off, don't open the blow-off cock full head; open it gradually until it is wide open, then shut the ash-pit and fire-pit doors, shut the damper close, but don't pull off the breech-plate or cover; leave the whole thing so that when the last drop of water and steam has gone out of it, you can close the blow-off cock and allow the boiler and brickwork to contract very gradually. If the room is perfectly dry, as we have stated before, the boiler can be left in this condition for months.

As a rule, it is better to blow the boiler off, leave it until it is cool—that means from 24 to 36 hours—then allow the water to run in and fill it full, clear up into the steam nozzles and steam dome, until there is positively no chance for any dead room; then shut it up tight, not allowing the air to circulate through it, under it or about it, and in this way the least injury will probably come to the shell of the boiler and connections. Very great care must be taken that it does not freeze in that way, for it will commence to freeze invariably in the small pipes and in those parts of the boiler where the smallest bodies of water really offer the greatest surface for refrigeration, or for the cold air to work upon. It is of no use to use anti-incrustators, soft soap, grease, potatoes or any other kind of slush or swill. Blow the boiler off under a pressure varying from 25 lbs. downward, and either one of the modes we have described here will be found safe and sure. In any event, the boiler should never be filled with cold water until after a number of hours from the time it was blown off. If it is above ground, it is perfectly safe to blow the boiler off as we have described, and then if it be a modern, well-constructed boiler, take out the hand-holes at each end of the boiler at the bottom, the man-holes at the top, cover over these places with coarse burlap, or something that will allow of a reasonably free circulation of air, and your boiler is perfectly safe in hot or cold weather.

There may be circumstances that might require some variation, but these are the only general rules we can give as applicable to any and all conditions or locations. One thing more must always be remembered. If the boiler is in an old shed, or in such boiler rooms as we have seen, if the boiler is where it is exposed to the droppings through leaky roofs, where frosts can gather, thaw, and fall, if the boiler is located so that water can get into the brick work or upon the shell, there is no such thing as keeping the boiler safe and sound, or in shape to do work reliably. The outside of the boiler must be kept dry when not in use, and it must be kept dry when in use; these conditions are arbitrary; that is, they admit of no qualification in either case. If the rain and frost can get upon the shell of the boiler, or upon the brick work in which it is fixed, the mortar, brick, and moisture will do more to injure the boiler than the genus ssp-head engineer.—*Boston Journal of Commerce.*

In nothing are the great improvements that have been introduced in iron making during the last 250 years so manifest as in the economy of raw materials. In 1615 it is estimated that in England 16 cwt., or 1,792 lbs. of charcoal were required to smelt a ton of iron. In 1798 the Scotch charcoal furnace used 24 cwt., or 2,688 lbs. of charcoal (equal to 192 bushels), and 2½ to 3 gross tons of coke. The increase in the amount of charcoal used is explained by the deterioration in its quality, arising from a difference in the mode of manufacture. At the earlier date it was made by the ordinary process in pits covered with turf, and at the latter by distillation in iron cylinders. How much this is in excess of the amount used at charcoal furnaces at the present time we need not inform our readers. The same is true of the waste in puddling or refining pig. In 1615 the waste in this process was estimated at 50%. In 1798 Mushet states that "40, 35 to 30 cwts. of crude iron have been used to fabricate one ton of finished bars." In a note, the date of which we do not know, he says a ton of merchant iron is now made with from 26 to 27 cwts. of pig iron. It is now generally estimated that a gross ton of pig will produce a net ton of bars.

Iron or steel immersed in a solution of carbonate of potash or soda for a few minutes will not rust for years, not even when exposed to a damp atmosphere.

Polishing Wood with Charcoal.

The following method of polishing wood with charcoal, now much employed by French cabinet makers, is taken from the *Cabinet Maker:*

"All the world now knows of those articles of furniture of a beautiful dead-black color, with sharp, clear-cut edges, and a smooth surface, the wood of which seems to have the density of ebony. Viewing them side by side with furniture rendered black by paint and varnish, the difference is so sensible that the considerable margin of price separating the two kinds explains itself without need of any commentary. The operations are much longer and much more minute in this mode of charcoal polishing, which respects every detail of the carving, while paint and varnish would clog up the holes and widen the ridges. In the first process they employ only carefully selected woods, of a close and compact grain; they cover them with a coat of camphor dissolved in water, and almost immediately afterwards with another coat, composed chiefly of sulphate of iron and nutgall. The two compositions, in blending, penetrate the wood, and give it an indelible tinge, and, at the same time, render it impervious to the attacks of insects.

"When these two coats are sufficiently dry, they rub the surface of the wood at first with a very hard brush of couch-grass (*chiendent*), and then with charcoal of substances as light and friable as possible, because if a single hard grain remained in the charcoal, this alone would scratch the surface, which they wish, on the contrary, to render perfectly smooth. The flat parts are rubbed with natural stick charcoal, the indented portions and crevices with charcoal powder. At once, almost simultaneously, and alternately with the charcoal, the workman also rubs his piece of furniture with flannel soaked in linseed oil and the essence of turpentine. These pouncings, repeated several times, cause the charcoal powder and the oil to penetrate into the wood, giving the article of furniture a beautiful color and perfect polish, which has none of the flaws of ordinary varnish. Black wood, polished with charcoal, is coming day by day to be in greater demand; it is most serviceable; it does not tarnish like gilding, nor grow yellow like white wood, and in furnishing a drawing-room, it agrees very happily with gilt bronzes and rich stuffs. In the dining-room, too, it is thoroughly in its place to show off the plate to the greatest advantage, and in the library it supplies a capital framework for handsomely bound books."

The Young Mechanic.—Some young men have queer taste. They would sooner deal out tea and sugar, fish up mackerel, or draw syrup than become a mechanic. They deem it more desirable and more honorable to measure calico, to sell tape and pins and needles, than to become an industrious and advancing workman in a shop or factory. To the intelligent, hopeful, diligent mechanic there is a promising future. Boundless possibilities stretch out before him. Fortune and fame beckon him onward in his career. If in his struggle to mount high the ladder of his chosen calling he finds that his hands are soiled, it matters not; he realizes that a stain upon the hands is indeed better than a stain upon the reputation. There is a wide gulf between the position of the clerk, who is a mere drudge in a store, and the young mechanic whose brain is active with inventive thought. We mean no disparagement to the clerk, but the chances for improvement and advancement are so immeasurably greater to the mechanic than the mere salesman that the two seem separated by an almost impassable distance. The world is crowded with cheap clerks and worthless dandies, but there is a lack of young mechanics. In the workshops of the land there is plenty of room for young men of the right mettle. They will be well paid, and will find opening before them, in every direction, avenues of advancement. The young man who enters life's real duties in possession of a good mechanical education, goes backed by a fortune which cannot be lost or taken from him.—*Exchange.*

The use of steel for shipbuilding is rapidly increasing, and the success the superior metal is meeting with is astonishing even its boldest advocates. It is stated by some prominent shipbuilders that on account of the decreased weight required in steel substituted for iron, and the consequently greater floating power that can be obtained in a steel vessel over one of iron of the same size and shape, that it is more economical to build a ship of steel than of iron, even if the former metal costs 30% more than the latter. Such, however, is the wonderful development of the steel industry within the past five years, especially since the adoption of Thomas & Gilchrist's basic process, that it is probable that within a very few years the price of steel ship plate will be no greater per pound than iron plates.

A High English Authority Acknowledges Inferiority.—There are many articles in the production of which greater taste might be cultivated to much advantage, a matter in which, as a nation, we have never excelled, and in respect of which several foreign countries are a long way ahead of us. An example, which will readily present itself to many minds, is to be found in the superiority of the tools which are now so largely imported into this country from America, and which, while remarkable for their quality and finish, are much less costly than those of English production.—*London Iron.*

SCIENTIFIC PROGRESS.

Speed of the Senses.

There are 31 pairs of compound nerves in the human body, the sensory and motor fibers of which are so commingled as to render it an impossible undertaking to separate them by any means at present known. Now if, for instance, a needle be stuck into one of the fingers, the sensory fibers take the impression through the nerve and the posterior root to the spinal cord, and thence to the brain. The command goes out to "draw the finger away." The mandate travels down the spinal cord to the anterior root, and thence through the motor fibers of the nerve to the muscles, which immediately act, and the finger is at once removed. All this takes place with great rapidity, but yet with nothing like celerity once imagined. The researches of Helmholtz, a distinguished German physiologist, have shown with great exactitude the rate of speed with which the nervo fluid travels; and other observers have given a great deal of time and patience to this and kindred questions. As the result of many deliberations, it was ascertained that the nervous fluid moves at the rate of about 97 1-10 ft. in a second. Now, electricity travels with a speed exceeding 1,200,000 ft. in a second, and light over 900,000,000. A shooting star moves with a velocity of 200,000 ft. in a second, and the earth in its orbit around the sun, 100,000. A cannon ball has a mean velocity of 1,800 ft. in a second; an eagle, 130; and a locomotive, 95. We thus perceive the nervous fluid has no very remarkable rate of speed. A fact which, among many others, serves to indicate its non-identity with electricity.

Prof. Donders, of Utrecht, Holland, has recently been making some interesting experiments in regard to the rapidity of thought, which are likewise interesting. By means of two instruments, which he calls the noemachronograph and the noematachometer, he promises some important details. For the present he announces that a simple idea requires the brain to act for .067 of a second for its elaboration. Doubtless the time required is not the same for all brains, and that by means of these instruments we may obtain definite indications relative to the mental caliber of our friends. What invaluable instruments they would be for nominating canouses, for vestries, for trustees of colleges, for merchants in want of book-keepers, in short, for all having appointments of any kind to make.

For the eye to receive an impression requires .077 of a second, and for the ear to appreciate a sound, .149 of a second are necessary. The eye, therefore, acts with nearly twice the rapidity of the ear.

Interesting Experiments on Plant Growth.

A curious modification of the normal structure of plant stems, showing the effects of light and heat upon vegetation, has been observed by M. Prillieux, on making the temperature of the ground about the plant higher than that of the air above. Beans and pumpkins gave the best results. The seeds were placed in earth in a large dish, in which was inserted part of a brass rod, bent at a right angle, and having a gas flame applied to its horizontal end. The chamber was moist and cold. The seeds germinated well; but on coming above ground the plants acquired a peculiar shape; they grew but little in length, and became unusually thick, the latter growth involving much tension in the surface layers, so that deep rifts before long appeared (mostly transverse), and made further growth impossible. M. Prillieux found the enlargement traceable mainly to an increase, not of the number, but of the volume of cells of the interior (cells of the cortical tissue and the pith). The excessive growth of these cells occurred not only in the cell wall, but in the nucleus, which was often multiplied. The excess of temperature of the ground over the air was about 10°.

Again, the view adopted by the older botanists, that light is either without effect on germination, or has an adverse effect, fails to harmonize with some results lately arrived at by Herr Stehler, in the case of many seeds of agricultural importance, such as varieties of meadow grass (*poa*), the germination of which he finds to be favored considerably more by light than by heat. Thus, with two groups of 400 seeds each of *Poa memoralis*, in one experiment there germinated in light, 62%, and in darkness, 3%. Similarly with *Poa pratensis*, in light, 59%; in darkness, 7%, and so on. Sunlight being a very variable force, difficult of determination, experiments were further made with gaslight, and with the same result—that light favors the germination of certain seeds, especially grasses, and that these germinate either not at all, or very scantily, in darkness. The fact was verified by Herr Stehler in quite a series of seeds, *Festuca, Cynosurus, Alopecurus*, etc. In the case of seeds that germinate quickly and easily, such as clover, beans or peas, he thinks light is probably not advantageous.

Mixing Colors.—When two or more colors are mixed together, the hue produced does not result from the loss of the particles of either the colors by absorbtion or chemical changes of any kind. The microscope reveals the fact that minute particles of each color remain entirely separate.

Animal Chemistry.

How seldom do we give a thought to the organization of the "house we live in," or the manner in which it is strengthened and undermined. We seem to think that it can take care of itself exactly as well without our aid as with it, and better too, perhaps. We don't reflect that, after all, we are mere animal, chemical machines, and that various substances combined in the human stomach present the same phenomena that they would in the receivers of a chemist's laboratory. For example, we see it stated that without lime the secretion of milk fails; "the bones and teeth become soft or are arrested in their development; without soda, no bile can be formed; without phosphorus and magnesia, the nervous tissues loose their energy, and the impaired condition of the brain is evinced by loss of memory, frightful headaches and impending paralysis. Ghastly paleness, prostration, faintness and coldness attend the lack of carbon; deprived of sulphur, the hair would rapidly cease to grow, and the absence of iron is marked by lividity, disordered digestion, passive dropsy and other symptoms of an acæmic or chlorotic character. The food we receive daily furnishes the natural source of these elementary substances, and serves during health to repair the waste of these matters, through the skin, kidneys and other excretories, consequent upon the voluntary and vegetable functions of the economy. Hence the equilibrium is preserved. Inordinate use of particular organs induces a disproportionate consumption of their substance, and hence of the elements from which this substance is formed. Excesses in watching, thought and muscular effort, for example, by overtaxing the brain and muscular fiber, render these tissues rapidly effete, and therefore cause an exaggerated demand for their peculiar pabulum, as phosphorus and iron."

Scientific Progress — Geographical.—Within the last 35 years all the principal features of the geography of our own vast interior regions have been accurately determined; the great fields of central Asia have been traveled in various directions from Bokhara and Oxus to the Chinese wall; the half-known river systems of South America have been explored and surveyed; the icy continent around the southern Pole has been discovered; the northwest passage—the *ignis fatuus* of nearly two centuries—has been at last found; the Dead Sea is stripped of its fabulous terrors; the source of the Niger is no longer a myth, and the sublime secret of the Nile is almost wrested from its keeping; the Mountains of the Moon, sought for 2,000 years, have been beheld by a Caucasian eye; an English steamer has ascended many of the African rivers; Leichard and Stuart have penetrated the wilderness of Australia; the Russians have descended from Irkoutsk to the mouth of the Amoor; the antiquated walls of Chinese prejudice have been cracked and are fast tumbling down, and the canvas screens that surrounded Japan have been cut by the sharp edge of American enterprise. Such are the principal results of modern exploration. What quarter of a century, since the form of the earth and the boundaries of its land and water were known, can exhibit such a list of achievments?

Sound.—The following curious observations of sound have been carefully verified by an extended series of experiments: The whistle of a locomotive is heard 3,300 yards; the noise of a railroad train, 2,800; the report of a musket and the bark of a dog, 1,800; an orchestra or the roll of a drum, 1,600; the human voice reaches to a distance of 1,000; the croaking of frogs, 900; the chirping of crickets, 800. Distinct speaking is heard in the air from below up to a distance of 600 yards; from above, it is only understood to a range of 100 yards downwards. It has been ascertained that an echo is well reflected from the surface of smooth water only when the voice comes from an elevation. Other similar phenomena connected with the transmission of sound have been observed, but the results disagree, either from inaccuracy in the observations or from the varying nature of the circumstances affecting the numbers obtained. Such variations occur to an extent of 10 to 20 per cent., and even more. The weather being cold and dry, or warm and wet, are the chief influencing causes. In the first case the sound goes to a greater, and in the second to a lesser distance.

An Interesting Crystal.—A quartz crystal was some years since taken from the wall rock in the Æna mine, El Dorado county, 150 ft. below the surface, in the center of which is imbedded a group of black gnats, with their wings spread as if in actual flight. The crystal is as clear and transparent as glass, and there can be no mistaking the character of the insect imbedded in it. The specimen was cubical in form, with its faces about four inches by four in size.

Crystals in the Dark.—It has often been observed that when many crystalline bodies, such as sugar, are suddenly broken in a dark room, a flash of light is seen. A phenomenon, probably similar, has been recently noticed when a piece of twilled calico is quickly torn in a room from which the light is excluded. After the calico was washed, the phenomena could not be obtained, whence it is probable that it was due to the dressing contained in the new goods.

Mining Share Market.

The figures representing the business of the stock market, as shown in our stock tables, indicate no special activity. Fluctuations have been slight and business small. The Bodie *Free Press*, in speaking of that camp, says: Jnst at present, however, there is need of a new and valuable development—something hig The latest news from the Red Cloud and the Noondays is very good. As the work of development goes on, the prospects grow hetter. There is no douht hut a hig mine will soon he found on Silver hill. The Bodie Con. continues to take out very rich ore, and the hullion shipments are large, considering the milling facilities—over $1,000 a week for each stamp. The mine looks well. Good reports continue to come from Oro, and the superintendent is making every effort to speedily open up the mine. The Syndicate mill is still crushing ore from the Bodie dump.

The Virginia *Enterprise* says: In thc Mexican the deposit of ore so long followed down in winze No. 1 has now passed across to the east. It remained about the same from the first to last—a mixture of very rich streaks and low grade, the whole constituting fair milling ore. If desired, the ore may he easily reached and examined hy making a short crosscut to the east at the 2800 level. It will he likely, at the present dip, to strike the 2900 level at a point a short distance to the eastward of the main north drift on said level.

The Best and Belcher folks are now rapidly drifting to connect on their 2500 level with southwest drift No. 2, from the Consolidated Virginia. This will he, in many respects, a very important connection.

At the Chollar-Norcross-Savage shaft they are now engaged in sinking their sump some 15 feet deeper. This work is about finished, and they will next start a drift west from the 2600 station, to cut the fine hody of quartz encountered in the west drift 200 feet ahove. Above it was cut at a distance of 600 feet from the shaft, therefore the present drift will reach it io going a distance considerahly less. As the dip is carrying this hody of quartz to the east quite rapidly, it will presently be cut and passed through hy the main shaft. It is known to contain (from assays obtained above) some streaks and spots of good milling ore. A honanza in the middle mines may, after all, he that which is next in order. The honanzas have heretofore thus jumped from point to point along the lode. At all events those who huy stock in the middle mines at present prices are not likely to "lose money on the goods."

At Gold Hill much excellent ore is now being extracted from the old upper levels—say from the 1500 levels up—of the Crown Point, Belcher and Yellow Jacket mines.

Meetings and Elections.

Con. Pacific—Aug. 19th. Directors: W. T. James (President), T. E. Jewell (Vice-President), S. B. Caldwell, E. F. Preston and Warren Holt; F. E Luty, Secretary.

Martin White—Aug. 17th. Directors: C. H. Stanyan, Annis Merrill, E. D. Sawyer, C. H. Hangar (President), Henry Sweetapple, Superintendent; J. J. Scoville, Secretary.

South Bodie—Aug. 21st. Directors: John J. Scrivner, John G. Klumpke, B. B. Minor (President), M. P. Minor, Henry Deas (Secretary).

Independence—Aug. 21st. Directors: A. W. Foster (President), F. A. Berlin (Vice-President), S. Tallman, W. W. DeWitt, J. W. Pew (Secretary). W. C. Price was elected Superintendent. The company's cash on hand is $535.06.

The Pacific Borax Works, at Fish Lake valley, Nev., were recently opened with suitable ceremonies.

Recent Contributions to the California State Mining Bureau.

[Furnished for publication in the Mining and Scientific Press by Henry G. Hanks, State Mineralogist.]

[CATALOGUE.]

4149. Quartz (Wood Opal)—Placer county, Cal. J. Z. Davis.

4150. Bowlder of Fine Grained Diorite or Basalt—Strongly resembling serpentine externally. Folsom, Sacramento county, Cal. J. Z. Davis.

4151. Asphaltum Nodules or Water-worn Bowlders—Found on the beach at Santa Barbara, Cal. J. Z. Davis.

4152. Silicified Wood - Large and remarkably fine specimen. Placer county, Cal. J. Z. Davis.

4153. Indurated Sand Stratum—Four feet above the beach, Pescadero, San Mateo county, Cal. J. Z. Davis.

4154. Specular Iron Ore—Island of Elba.

4155. Zeolite (Undetermined) in Lava—North Fork mining district, Fresno county, Cal. Morris Burke.

4156. Auriferous Quartz—Carga Muchacho mine, 12 miles west of Fort Yuma, San Diego county, Cal. Up to June 17, 1882, this mine has produced 14,000 tons of quartz, which yielded in the mill at El Rio $167,000. This statement is made hy Mr. Wm. Sublette, by whom the specimen is donated.

4157. Alloquachick—Shell money of the Klamath Indians of California. John Daggett.

4158. Pearls from the Abalone Shell (Haliotis)—Island of Santa Cruz, off the county of Santa Barbara, Cal. J. Z. Davis.

4159. Arrow Head of Chalcedony—Found in the principal street of the new town of "Calico," San Bernardino county, Cal. John Daggett.

4160, 4161, 4162. Ancient Roman Coins—J. T. Smith.

4163. Link of an Iron Chain—Found at the camp of the lost emigrants in Death valley, Inyo county, Cal. (See No. 3098.) James E. Parker. The following is an extract from the Inyo *Independent* of Aug. 12, 1882:

Notices of Recent Patents.

Among the patents recently obtained throngh Dewey & Co.'s Scientific Press American and Foreign Patent Agency, the following are worthy of special mention:

Wood Planing and Sawing Machine.—J. F. Welch, East Oakland. No. 262,167. Dated Aug. 1, 1882. This invention has relation to wood-working machines, and combines in one the functions of three machines. By this device lumher is planed, ripped and cut into lengths in one operation. Provision is made for the lateral adjustment of the ripping saws so that different widths may he cut out at the same time. The cutting-off mechanism is ingenions and effective. It consists of a circnlar saw mounted npon a table or frame which travels across the work hy means of the same power which drives all the saws and the surfacer heads. This tahle is nicely adjnsted and hegins and ends its work with perfect regularity. It will at once he seen that in driving a saw across the work, that the feed must stop to allow the operations of the cnt-off saw. This is accomplished hy the lnmher itself, which, when it meets a certain stop, moves it to throw the feed rollers ont of gear, and at the same moment the cut-off saw hegins. This stop is adjustahle outward from the machine to vary the length into which the lnmher is to he cut. Heretofore, in single machines, they have never advanced frnrther than to combine planing devices with ripping saws. Mr. Welch is the first to add to these the cntting-off mechanism. The labor saved hy this invention is the hest proof of its assured success. It would astonish one who has never seen the operation to see a rongh hoard started in at one end and come out at the other in narrow strips of any desired length, and all dressed ready for nse. Of the many gigantic strides which have characterized the advance of art in respect to wood-working machinery, this device is entitled to rank among the greatest.

Car Coupling.—Clarke Hendricks, Modesto, Stanislaus Co. No. 262,668. Dated Augnst 15, 1882. This car-coupling device is so arranged that the two parts automatically connect when the cars come together, and the disengagement can he effected from above without going hetween the cars. It is an improvement on devices of this character in its simplicity.

Mining Summary.

The following is mostly condensed from journals published in the interinr, in proximity to ths mines mentioned.

CALIFORNIA.

AMADOR.

Zeile.—*Ledger*, Aug. 10: Everything moves along smoothly at this mine. The mill is kept steadily at work, crushing over 100 tons in 24 hours. The ore body met with in three lavels—200, 400 and 600—is immense. In some places it measures 50 ft between the walls, and will average about 40. In this condition of affairs the 800 level is not worked, as the vast quantity of quartz now in sight is ample to run the mill for years. Some 50 miners are employed undsrground. The rock is of low grade, and it is owing to this fact that so many men are required underground. Nut half of the rock extracted goes to the mill. A force of 20 men is kept husy in sorting out the ore—the best sent to the mill, and the balance thrown aside into ths drifts. It is by this careful system of working that the mine is made to pay. Rumors are constantly afloat to the effect that an addition to the mill is to he made, and that watsr is to hs brought from the east side, but they are only rumors at present.

Miscellaneous.—The principal hydraulic claims in the vicinity of Volcam contemplate constructing dams and reservoirs to impound the debris. This will not involve much expense, and the idea is that it will he better to do this than to run the risk of a lawsuit.

CALAVERAS.

Copper.—Calaveras *Chronicle*, Aug. 16: We were shown a fine specimen of free copper, taken from the Campo Seco mine, near Campo Seco, the other day. Operations have recently been commenced upon the mine, and the developments are exceedingly promising. We are informed that a specimen was taken out a short time ago which was almost entirely pure copper, and weighed 300 lbs.

Reservoir Broke.—The reservoir on Tunnel ridge, which contains the water for mill purposes at the Rough Diamond gravel mine, in Chili gulch, broke the other day. The volums of water thus let loose worked mischief with the fixings on Gourley & Co.'s claim below, ws are informed, hy washing away their sluices and spoiling their dump.

INYO.

Panamint.—*Independent*, Aug. 19: Supt. Phoby returned to Panamint last week. He has been below for several weeks, purchasing supplies and transacting other business for the Inyo Con. Co. In the meantims a large amount of ore has been extracted from the company's mines—over 200 tons from the Wyoming slone. The ore is also of higher grade than that heretofore encountered. The hig mill is being put in shape for another run, which will commence about September 1st.

The Hirsch Mine.—Capt. Watt, James and Tom Ferguson expect to begin taking out ore from the Hirsch mine next week, to he worked at the Brown Monster mill. We are assured hy those who have recently visited this mine that its showing of what at least appears to he fine ore is something really astonishing in extent. There is no doubt but that a fair proportion of this immense deposit of ore can be made to pay well.

The Brown Monster Mill.—Mr. Chalfant, who has put in most of the summer at the above-named mill, claims that it is now in as good working condition for crushing and concentrating gold-bearing ores as any mill in the county, notwithstanding its general di apidated appearance.

NEVADA.

Prospecting.—Grass Valley *Tidings*, Aug. 15: Prospecting is brisk in this district, especially is this the case on Deer creek, in the vicinity of the Imperial Con. mine.

A ledge (the Belcher) has been located between Deer and Slate creeks, and a shaft started. The croppings of this ledge are traced for half a mile or more, and they look well. David McKay, superintendent of the Empire mine, is president of the Belcher Co. A meeting will be held on Saturday evening next, at which officers will be elected.

Deer Creek.—The Imperial shaft, on Deer creek, is now down 150 ft, and no water has yet been encountered. The prospect at the Imperial is most flattering.

The Empire is running full hlast, and is at present employing more men than it has done for yeare.

The Idaho is looking well in the lower levels. The 14 level will be opened in ahout a month.

East Eureka.—The East Eureka will crush the rock from a ledge lately found in that mine. This ledge was struck in the hottom level, and is nearly 4 ft thick. The quartz has greatly improved in quality as it is being taken up. Even in a run of 0 or 8 ft the change was perceptible, and, from present appearances, there is a promise of a good yield. Three shifts are being worked in the mine. The pump handles the water easily.

Some good quartz is being taken from the Greyhound ledge, a piece of which may he seen at the store of Henry Scadden.

The New York Hill mine is looking well, especially in the south drift. The company has great hopes of striking it rich in this drift.

The Pocket Claim.—Grass Valley *Union*, Aug. 16: The pocket claim, owned hy Nichols & Russell, still continues to yield nicely. On Tuesday a $50 pocket was found, and on Wednesday another pocket was discovered, from which about $15 was taken, when the ground began to cave and some timhering had to he done. The extent of this last pocket is, of course, unknown.

SIERRA.

Rich Diggings.—Oroville *Mercury*, Aug. 18: We have been informed hy W. R. Morgan that Col. Baker, of Grass Flat, Sierra county, has taken out of his mine within the last month nearly $150,000. The mins is upon the gravel channel that runs from St. Louis to Port Wine. The outlook is favorahle for taking out a much larger amount in the future.

TRINITY.

Paying Immensely.—Trinity *Journal*, Aug. 19: Capt. Geo. H. Atkins informs us that the quartz mines of Deadwood district are paying well. As an instance, we may mention the mine of which Mr. Lambert is the superintendent, and which will this month yield about $30,000, paying a dividend of from $23,000 to $24,000 from the yield of rock crushed hy a little 10-stamp mill. Capt. Atkins further informs us that Mr. Lambert has the mine in excellent shape; that there is ore enough in sight to run the mill, day and night, for two years yet to come; furthermore, that said ore is of high grade, and it is known that it will pay well.

PLACER.

Sunny South.—Cor. Placer *Herald*, Aug. 16: The Hidden Treasure M. Co. at this place are making preparations to work the mine through the new or upper tunnel. The carpenters are busy at work enlarging the blacksmith and carpenter shops, which will he completed in a few days; then car hnilding will commence and ahout 40 or 50 new cars will he constructed on a different plan from the ones now in use. They will be self-dumpers, somewhat similar to those now in use at the Mountain Gate mine, at Damascus. The wheels and axles for 34 arrived a few days ago. The foundation for the new dump is being pushed ahead in order to get it ready for the carpenters to commence the trestle work. The timbers are already on the ground, and are very substantial, and will require some muscle, combined with skill, to put them in place. Men are at work cleaning it out and grading the new tunnel. When completed the T-iron rails will be moved from the lower tunnel and placed in the new one—then it will he ready for the "iron horse"—at least there is talk of running the dirt out of the mine with a steam locomotive, hut whether it will he run hy steam or horse power, as at present, I cannot say. Mr. Cameron, the principal

owner, is at present superintendent of the mine. The company employs about 60 men, including Chinese. It is a pity that this mine, which is one of the best, and best equipped, in the State, should employ Chinamen.

A FINE PROSPECT.—Placer *Times*, Aug 19: Sunday J. T. Staples came up from Staples & Johnson's Green Valley river mine and brought up some fine specimens of rich cement taken from the claim. One piece of about the size of a man's fist contained not less than $5 in coarse and fine gold. There were pieces from about 10 cents' worth down. The mine is a river claim on the American river, and near the place where large quantities of gold were taken out in early days.

PLUMAS.

GIBSONVILLE.—Plumas *National*, Aug. 19: From reports brought by Mr. Jas. Miller, who was recently over in the Gibsonville country, we should judge that this old mining town was about to take a new lease of life, and again become one of the lively mountain towns. The owners of the Union mine, whose tunnels are a long way under the mountain, have recently proved the existence of an extensive back channel, and the gravel pays as high as $8 to the carload. This channel is certain to cross several other claims, and arrangements are already being made to open it up. Some long tunnels will be run, and Gibsonville promises to be a busy place for some years to come. The mines of that section are not "played out" yet, nor will they be for years.

THE WESTERN.—Mr. E. F. Parsons, who is superintending the operations of the California Prospect Co., at Nawtown Flat, showed us a "color" the other day which came from the Western tunnel, which weighed nearly 2 ounces. The tunnel is being run in bedrock, under the channel, and occasionally the top is in gravel, and in those places it shows decidedly rich. The idea is to keep down until the depth of the ground is ascertained, and then the work of breasting it out will be commenced. It looks now as though some "big money" would come from the Western in the near future.

CHEROKEE MINE.—Greenville *Bulletin*, Aug. 16. Since starting to sink in the shaft the work has been pushed along rapidly. The vein stands at a very sharp angle to the shaft. All the ore taken from the bottom of the shaft in sinking is sent to the mill and crushed with that from the Kettle ledge. As the ore is of much higher grade than the Kettle ledge ore, the effect ought to be seen in an increased yield of bullion for the last half of August. From the ore cars a number of pieces of ore were taken at random and prospected in a hand mortar; these pieces were believed to be a fair average of the ledge, and, if this is correct, then the ore is of greater value than the superintendent estimates it at. He says he thinks it will run about $10 a ton; but, judging by many prospects from nearly every mine and ledge in the district, we would say without hesitation that this will go nearer twice that amount. There is at present every reason to believe that this ledge will yield a large amount of valuable ore.

TAYLOR PLUMAS MINE.—The work on the upraise is going on steadily, with little, if any, change in the character of the ledge. In the main tunnel the ledge showed an increase in width as depth was gained into the mountain, but in rising toward the surface the same width is maintained from the tunnel upward, with very little variation. As but few hands are employed in the mine, progress is slow; yet, as nearly all the rock to be moved is good pay ore, a very large amount is now accumulated at the dump. When a mill is built this stock of ore and the great depth of backs then opened will ensure steady work for it till other stopes can be opened on the ledge further ahead.

PLUMAS NATIONAL MINE.—This mine will soon resume operations under a new organization, known as the Plumas Con. M. Co. Mr. Dorr Russell, president of the company, is now on the way here from New York, and is expected to arrive by Friday. Immediately after his arrival work on the mine will be resumed.

SAVERCOOL MINE.—On the 8th inst. Mr. Caldwell, superintendent of the Savercool mine, left New York for Greenville, with the purpose of resuming operations at the mine. The long torpor that has held a number of mining enterprises idle appears to be at an end, and a season of activity now is setting in.

NEVADA.

WASHOE DISTRICT.

UTAH.—*Enterprise*, Aug. 20: Are timbering the upraise and incline; also, are timbering and making necessary repairs to the bob-pit station, near the 1550 level.

OPHIR.—On the 2900 level the joint Mexican winze has been sunk and timbered 9 ft, and the cages put in place. The west crosscut has been extended 40 ft. During the week 70 tons of ore have been extracted from the croppings.

SIERRA NEVADA.—On the 2900 level the joint Union Con. west crosscut has been extended 20 ft.

MEXICAN.—On the 2000 level the joint Ophir winze has been sunk 6 ft, and cages put in. The north west drift has been extended 33 ft.

UNION CON.—On the 2900 level the joint Sierra Nevada west crosscut has been advanced 20 ft. In the main south drift, on this level, are easing timbers. During the week 157 tons of ore have been extracted, and 373 tons and 520 lbs sent to the mill.

YELLOW JACKET.—The water in the mine continues to rise slowly, it having risen but 5 inches since the last weekly report. At the Winters shaft, the north lateral drift, on Sagebrush level, was extended 37 ft in favorable looking quartz. The south drift on the second level has reached the south line of mine, or 170 ft from the switch. The quartz does not look so favorable as farther north. Will run a cross drift to the east. We are extracting some ore from the second, third and fifth levels.

BELL DISTRICT.

A VISIT TO THE DISTRICT.—Cor. Grantsville *Bonanza*, Aug. 16: On Monday last I visited Carbonate City. It is situated on the line between Nye and Esmeralda counties, in Bell district, about 30 miles southwest of Grantsville. Eighteen miles from Grantsville, on the Luning road, we turned to the left, and kept along the foothills on a new and somewhat rough wagon road till we brought up at the mines. After a hearty supper on the best which a prospector's camp affords, one item of which was fine antelope steak, we were in good condition to look over the mines, and there it was that an agreeable surprise met us. The Silver Castle mine, which was discovered three years ago, is the only mine in the district that has had any work done on it, and it shows bodies of ore, wherever opened, that would, in any part of the country except Nevada, have excited the attention of capitalists, and would have been developed, reduction works erected, and, if properly managed, be on the list of dividend-paying mines. The ore is a brown and gray carbonate and galena, carrying sufficient lead to make it a first-class smelting ore, and while scarcely high enough in silver to ship at a profit, can, with the advantage of cheap freights which its proximity to the railroad affords, and the abundance of material for flux, and the ease with which wood and coal can be procured, be worked cheaper than at almost any other point in the State. While such mines are very difficult for a poor prospector to realize anything from, they are the ones that carry fortunes for the men who are able to make the necessary expenditure for their working.

BRISTOL DISTRICT.

BRISTOL.—Pioche *Record*, Aug. 16: The affairs of the Bristol company, as far as we can learn, are about the same as two weeks ago. The strikes reported made in the Mayflower mine for the last 3 months were all false, and one of the parties interested in the property says he is unaware how these reports got afloat. There is another report out that a strike has been made in the Mayflower, and hope it is so, yet have our doubts.

BULLION.—The first bar of bullion was brought up from the Dry Valley mill on Tuesday. This is simply a sort of side-slice, for it is intended to work concentrations, which will be disposed of to the Day company for flux. When everything is in readiness and running, the work of concentrating will cause the disbursement of $1,500 to $2,000 per week. Every little helps.

COLUMBUS DISTRICT.

NORTHERN BELLE.—*True Fissure*, Aug 19: The main drift has been advanced 5 ft, and crosscut No. 1 has been extended 11 ft, the face being in decomposed quartz. Good progress is being made in the crosscut from the main drift on the third shaft level. Owing to the bad air and extreme heat in the winze below the intermediate, between the second and third shaft levels, work has been suspended at that point until the weather becomes cooler. The development in the winze below the ninth level has improved materially, the ore having widened, and the outlook is very promising. Connection has been made with the tenth level, near the northerly end of the stope, from the crosscut of the last-named level. As soon as possible, a chute will be put in, and this will afford much better facility for the extraction of ore from this portion of the mine. The daily output of ore has been about 62 tons. Mill No. 2 is running steadily and doing its usual good work. The shipments of bullion amounted to $25,941.45 to the 17th inst., and aggregated $49,805.74 to the same date.

MOUNT DIABLO.—The north crosscut from winze No. 1 was stopped after reaching a length of 70 ft, and an east drift was started from this crosscut near the foot of the winze. The face of the drift shows a 10-inch ledge of $40 ore. The west drift from the Callison winze is not looking so well as there is a streak of dirt ore in the face, which looks promising. There are bunches of ore in the east drift from the south crosscut on the first level that assay $80 per ton.

GENERAL JACKSON.—Active operations are being continued on this property under very favorable circumstances. It is the intention to begin the reduction of this ore already extracted at a not very distant date.

EUREKA DISTRICT.

EUREKA TUNNEL.—*Sentinel*, Aug. 18: In company with Gen. Connor, a *Sentinel* reporter visited the Eureka Tunnel yesterday, to inspect the ore body which has been so far explored by a drift about 70 ft in length. It has all sorts of dips and angles, but is seen between clearly marked limits all along the length of the drift. It averages from 2 to 2½ ft in width. It is mostly light yellow and dark brown carbonates and of very high grade. The drift, which is about 100 ft below the tunnel level and about 600 ft below the surface of the mountain at its northwest extremity (it runs northwest and southeast), is in a fine body of light-colored carbonates, which runs across at right angles with the course of the drift. The bottom of the ore body, in several places, has not yet been reached at the bottom of the drift. Yesterday miners were at work digging upon a bunch of ore which extends down lower. The result of this digging will be watched with some curiosity, as it is not improbable that it may turn into something big when prospected further. Wherever the ledge appears, it is bold, and when followed above or on its dip down to either side, may reveal a chamber of ore at any time. The prospects all along the drift are certainly very flattering. Mr. Mette, the foreman, calculates that there are 200 tons of ore in plain sight, an amount equal to what has already been extracted from the drift. The ore is soft and easily picked off. The only drawback is the foul air. It is difficult to keep a candle lighted, and were it necessary to do any blasting, the men could not work in the drift at all. The air-blowers in position no not purify the air sufficiently, as they have to drive down air partially impure. This trouble is to be removed very soon, however. The working shaft is being sunk rapidly, and at the end of 40 days, it will be down far enough to be connected with the drift, when a current of air will be had.

PUEBLA DISTRICT.

PUEBLA COPPER MINE.—*Silver State*, Aug. 17: J. C. Weir is in from Pueblo district, where he is engaged in copper mining. He says they have abundance of ore, and are now putting up small leaching works to see if it can be successfully reduced by that process. If leaching proves to be a profitable way of treating the ores, they will erect large works and make their own acids on the grounds.

RED CANYON DISTRICT.

A NEW DISTRICT.—Esmeralda *Herald*, Aug. 10: Down in Douglas county, at a miners' meeting held on Saturday last at the Holbrook mine, a district was duly organized, and D. W. Fish elected Recorder. The new district extends from Silver Lake on the north to Silver Glance on the south, and is called the Red Canyon mining district, and embraces all the mining region of Burbank, Bed Canyon and all the mining country east of the range as far as Smith's valley.

ARIZONA.

NEW GROUP TO BE WORKED.—Pinal *Drill*, Aug. 19: We understand that arrangements have been completed with an Eastern company, with ample capital, to work on the belt of mines lying to the northeast of the Silver King, and lively times may shortly be anticipated in that direction. This group is at present owned by James McCaffrey. It comprises the Black Diamond, Manhattan, Santa Rosa, Quaker City, Indiana and one-half of the Rattler mines. Considerable development work has already been done on these mines, which show a well-defined ledge. Any work in the immediate neighborhood of the King is of interest, and further developments in this quarter will be closely watched. These mines adjoin the Oxford-Dover mines.

THE OUTLOOK.—Considerable life is being manifested in our mines. On the Josephine ledge, sales are being made, and work will shortly be resumed on several of the chief locations of this, one of the most promising ledges in the district. Every foot of depth in the Blk is anxiously watched, as that mine can hardly fail to strike the Silver King ore body at a sufficient depth. On the other side of the King, the South King is taking out some good ore. The splendid Hastings mill will shortly be turning out gold bars. The Mount View is looking lively, and a new strike of rich ore has been made in the Last Chance. There is little doubt that the Goodenough company will soon commence work on their property. The recent sale of a fine prospect, near Box canyon, will turn attention in that direction. Assessment work is commenced on a number of promising claims, and interesting developments are daily made. The great intrinsic wealth of our district is bound to assert itself.

HUMBUG.—Prescott *Courier*, Aug. 14: The Tiptop and other mines, in Humbug district, are yielding rich ore. As the climate of the district is warm in summer, not much mining will be done there for a month to come.

SILVER MOUNTAIN.—Northwest of Humbug, in Silver Mountain district, several good gold-bearing veins are recently discovered, the ore of which is being worked by arastra process with good success. There are in this section of the county very large silver ledges, notably the Mammoth. It is a section which offers tempting inducements to prospectors, but it is a hard place to prospect, owing to the heavy oak brush which covers it. A good fire would open this county to "civilization" and beans.

PROSPECTORS.—Some 6 miles from Silver Mountain, in the pine timber, there are just now a great many miners and prospectors. The Tiger will soon be cleared of water and mud..... E. S. Junior's mines are yielding fine ore, besides many others.....Messrs. Moody & Place have fine prospects in Bradshaw basin.....The Black Warrior people, in Peck district, are thinking of shipping their rich ore to Pueblo, Colorado, or Newark, New Jersey..... Moe & Co. are all the time working the Tuscumbia ore in their mill.....The mines in the Dos cris country are more promising than at any previous time in their history..... The Murphy mine, in Turkey Creek district, is creating excitement with its 4 ft of rich ore.....A whim for Henszey & Co. was recently received in this district.....The Belle mine, near the head of Big Bug creek, is about to change owners. It has a good name, as have other ledges in its immediate vicinity.....The Silver Belt mine, in another portion of Big Bug district, is turning out abundance of rich silver ore.....Dake's smelter, near the head of Lynx creek, should be running now.....The mill on Groom creek, 6 miles south of Prescott, is running on ore from the Adel mine. It pays well in gold. It will shortly commence reducing ore for Mr. Rubert, which ore has sampled nearly $200 a ton in gold.....The mill at Cherry creek, in Black Hills district, made a clean-up a few days ago, with what result we are not informed.....The talk here is that regular quartz reduction works will soon be set up either in Prescott or on the Hassayampa.

TOMBSTONE DISTRICT.—*Republican*, Aug. 19: During the past week there have been no unusual developments in the district. Affairs of the bonanza mines have jogged along at their usual easy pace, extracting and shipping ore to keep all the stamps busy and turning out the ordinary amount of bullion. All things considered, the mines of the district have done remarkably well since their discovery. The gross output has been in excess of $10,000,000, which will be increased to $12,000,000 by the beginning of 1883. When it is known that this amount has come from 10 mines, when there are at least 100 that could be placed upon a paying basis with sufficient capital to properly open and work them, it will be acknowledged that the results have been all that could be expected under the circumstances. The bullion producers have been Contention, Grand Central, Tombstone M. & M. Co., Vizina Head Center, Ingersoll, Way Up, Tranquillity, Girard and Stonewall. These mines are now to be supplemented by Randolph, which, it is believed, will become a large producer. Empire is also piling up large quantities of ore up on its dumps, as is also the Woronoco, the Contact and Blue Jacket, besides others with lesser amounts that will come in to swell the production of 1882. By the foregoing it will be seen that the prospects for the district were never brighter than now.

COLORADO.

CONQUEROR.—Georgetown *Courier*, Aug. 17: The Carter-Bancroft mill, at North Empire, is running this week on ore from the Conqueror lode, with good results.

SMELTING PROCESS.—The introduction of the Campbell smelting process, at Idaho springs, has been fully decided upon; the old Starr mill has been leased, the brick for the furnace purchased, and Col. F. F. Osbiston has been appointed superintendent.

ORE.—A strike of 3 inches of ore that assays from 600 to 700 ounces of silver per ton was made last Saturday in the Pickwick lode, Saxon mountain, in the tunnel level. The lode is owned by Gen. Richardson, of Syracuse, N. Y., and Capt. Cree.

WILLIAMS FORK.—Williams Fork is having quite a boom this year, and the developments thus far made warrant the belief that this district will soon become a prominent ore producer. There are at present from 150 to 200 men in the district engaged at prospecting or developing claims previously located. The town site known as Hill City, which was located last year, has been abandoned, and a new town site location called Bedford has been made about a mile and a half further down the creek, at the forks, where there is a good level site. The old wagon road is being cleared of fallen timber and placed in condition for travel, and probably will be extended down to the Orand river by the toll-road company.....The Helping Hand and Ready Cash lodes, owned by Wilson & Co., cross each other, and each shows a vein of ore ranging from 4 to 20 inches in thickness. The ore is a mixture of galena and decomposed ore, which milled at the last run 278 ounces per ton. A crosscut tunnel, now 220 ft long, has been driven for these lodes, and is expected to intersect them every day.....The same parties also own the New Florence lode, on Garfield mountain, which shows a 4-inch vein of decomposed ore that assays 340 ounces..... The Bohtall, owned by Thomas Webb, John Sanders, John Halls and J. H. Berriman, is opened by a drift 75 ft long, which shows a continuous vein of ore 10 inches thick in places, which, at the last bulo, milled 251 ounces per ton, and there is also considerable scattered ore. They milled 35 sacks last week, and have enough unassorted ore on their dump to make about 75 sacks full. The ore is galena, carrying yellow and gray copper and silver glance.

VERMILION DISTRICT.—*Register-Call*, Aug. 18: Mr. Henry Hale, who is engaged in prospecting in Vermilion district, is in the city. In a brief interview with him we learned that the Rattler lode, near Lake Pisgah, is opening up beyond the most sanguine expectations of Lynn & Co., the owners. The Authentic mine owned, by Jacob Leidinger & Co., as depth is gained improves, the ore becoming more compact and closely defined. The Chloride, Rockwell & Co. owners, is being worked, and the prospectors working near Peck gulch are opening up several new strikes. From present indications it is safe to predict that the mines of this district are receiving a new impetus through the developments now being made.

A NEW STRIKE.—A new strike is reported from the Last Chance mine, on Silver mountain, south of the Cyclops, and owned by John Bennetts, of this city. The vein has been developed through 3 shafts to the respective depths of 28, 60 and 30 ft. The discovery shaft, which is the deepest, has improved greatly in the last few feet sunk, ore from which carries both brittle and native silver. Returns of ore sold to the smelter vary from 200 to 800 ounces silver per ton. A new shaft building has been erected recently, and other improvements made on the property. This mine has been visited by a number of capitalists the past week.

IDAHO.

THE MORNING STAR.—Ketchum *Keystone*, Aug. 14: Mr. Cheasbro, of Boise City, has been very successful in the work put on the Morning Star, on East Fork, during the last few weeks. The Morning Star is the first extension south of the celebrated North Star, and a good share of work has been put on several promising seams of mineral, but not until lately was the main ledge struck. A 12-ft cut was put in on an iron seam at a point about 700 ft from the North Star line, and shows a 4-ft vein of galena. This strike is in a direct line with the North Star vein, and is, without doubt, the same ledge. Mr. Cheasbro purchased this mine 2 years ago for $6,000.

PAYMASTER MINE.—The Paymaster, on East Fork, owned by the Philadelphia company, is being opened by an incline on the ledge and a tunnel. The incline is down 20 ft, and exposes an 18-inch vein of galena and iron ledge matter. The tunnel will tap the vein at a depth of about 100 ft, and has already encountered huge chunks of galena, although in but a few feet. Ten men are employed on this claim and an extension to it.

WOOD RIVER NOTES.—Wood River *News-Miner*, Aug. 14: The Minnie Moore hoisting works will blow their whistle on Monday next.....Davis & Corning have some beautiful specimens of ore from their Lost River mines at Riley & Tracey's drug store. They will take out a large amount of ore for the Bailey buyers during the next 60 days.....Prof. Delius, Louis Gottleib and others have sent up sacks for ore from their Fredonia mine on Big Smoky. A few tons will be sampled in Corning & Moulton's sampling works, Hailey, at once, and a sale is pending, if the result is satisfactory.....It is a pleasure to record the fact that the miners have run their picks into 300-ounce ore in the Mountain View, next to the line of the Rising Sun. Barney Quigg owns the latter, and with his force of workmen is now very busy after raising some of the "same formation."..... Dave McIvers, like Habershaw and Mr. Carey are said to have recently discovered a fine vein of black sulphuret ore in the Elephant mine, 12 miles up Warm Spring creek from Ketchum.....Peter Foster, the old Eureka miner, has a contract to take out ore from the Iron King, on East Fork, for a Philadelphia company.....Some play in luck, and Prof. Delius, the musician, is one of 'em. Only a short time ago he purchased, for a few dollars, an interest in the McClellan, near the Atlanta mine, Sawtooth. They are now down 50 ft; have a 3-ft vein of milling ore, running from $100 to $700 per ton, and Delius has been offered $5,000 for his interest. L. Gottleib, N. Hudson and George Spencer are the other owners in the property.....Billy Altafer, also came in from his new strike, 4 miles west of the Ketchum and Galena road. Assays prove his ore to be milling; he has 5 ft of ore, like sample, which assays $825 in gold, but the silver assay was lost and we cannot get the figures total this week.

MONTANA.

STREAM TIN.—*New Northwest*, Aug. 18: A considerable quantity of stream tin has been picked up at one time and another on Peterson creek, 3 or 4 miles from Deer Lodge. Among others who gathered quite a lot of it, was Benjamin Franklin, who picked up a can of it and recently sent a quantity to Prof. W. P. Blake, of New Haven, Conn., for assay. We have seen the reply of Prof. B., stating the samples contained 75 p. ct. of metallic tin. He seems to take much interest in the find, and gave quite full instructions as to tracing for the lead and reducing the ore, and asks for further samples. The stream tin found is doubtless a wash from the ore in place, but it is questionable if ever a lead that will pay to work will be found. It might, however, interest some of our prospectors to look around for it. We believe there are no paying tin mines yet discovered in America.

NEW MEXICO.

BURRO MOUNTAINS.—*New Southwest*, Aug. 14: This past week has been productive of much work and considerable encouragement in the Burro Mountains district. A gentleman, who has been in the district from the beginning, gave it as his opinion that there is more actual work being done now than at any period in the history of this camp. The wonderful richness of the Clara Clarita has given an impetus to prospecting on an extensive scale in the western portion of the district. Scarcely a day passes but new developments of astonishing richness are made in the Clara Clarita, and the result is that every claimant in the vicinity has gone to work with a will to determine if the Clara Clarita bonanzas extend to its neighbors. A strike of considerable magnitude has been made in the Bobtail, adjoining the Belle of the West, and one of a group comprising the Florence and Brunswick, belonging to Capt. S. Nickerson. The Florence and Brunswick are extensions of the Bobtail and Belle of the West lodes, which will be developed as soon as possible. Everything in the camp looks encouraging.

ST. LOUIS.—Work on the St. Louis mine is being prosecuted with rapidity. A body of iron and copper pyrites has been encountered in the winze started from tunnel No. 1, which is down nearly 60 ft, and also in shaft No 1, which has attained considerable depth. The pyrites extracted from this mine will average 25 lbs copper, and will shortly be able to supply the smelter with ample flux, thereby saving the company the trouble and expense of purchasing and hauling flux from places outside of this district.

COPPER.—During the month of July, 22,614 lbs. of copper matte was run from furnace No. 1, 13,377 lbs. from furnace No. 2, which was shut down for 15 days during the month for repairs, and 12,306 lbs. from furnace No. 3. This furnace was not fired until the 19th of July. During the same month, 60 tons of first-class ore was hoisted and hauled from the St. Louis to the Valverde smelter; 25 tons from the Boston and 28 tons from the Milton. Last week 28,886 lbs. of blister copper was roasted out of furnace No. 3. Roasting is continued in this furnace, while furnaces 1 and 2 are making matte. Last Wednesday a load of copper was shipped from Deming to Baltimore by the Valverde company.

A SUCCESSFUL SMELTER.—*New Mexican Mining News*, Aug. 19: The Hubbs' smelter, a 40-ton galena, at Bonanza, has proved a great success, fulfilling all the promises of the manufacturers, and expectation of the owners. Much delay has been occasioned by the lack of supplies, but these have been provided, and a long and successful run is now anticipated. Considering the many failures that have been made in this kind of mining enterprises, both in this Territory and Colorado; it affords us much pleasure to record such an instance of success. This is one of the famous Pacific water smelters, made by Rankin, Brayton & Co., of the Pacific Iron Works, in San Francisco, and which is now in general use and great favor in all the mining districts of the country. We are glad to know that our mining men are now learning what has long been the practice on the Pacific coast, not to experiment in machinery for reducing ores, when well known and tried appliances can be had that can be counted upon for success, and which involve no risk to the purchaser. When all chances regarding the manipulation of ores are thus eliminated from a mining proposition, leaving only the question of product and management, mining will soon come to be regarded as the safest as well as the most profitable business in the country.

OREGON.

GETTING READY.—Jacksonville, *Times*, Aug. 18: Some of the miners are getting ready for winter.....Jack Layton, of Applegate, is still cleaning up considerable of the glittering ore.....Quartz interests are looking up, and considerable prospecting for ledges is being done.....A. W. Sturgis is still at work in his drifting claim, on Jacksass creek, with fair success.....The sale of the Josephine mine has been postponed until Monday, Sept. 25th..... With very few exceptions, all the miners of Foots creek have suspended work for the season. Goldworthy & Justus are still at work, however, and are doing well..... N. O. Mitchell and George Ross are taking up a large number of quartz ledges in different portions of the county. We learn that they have a mill at Roseburg, which will soon be shipped to this section.....John Bolt, of Applegate, was in town Saturday and informed us that Derickson & Co. have struck a promising ledge at Horsehead, in Josephine county. Their mill has already arrived and is being put in position.....D. Slagle, who now resides near Waldo, Josephine county, informs us that Wimer & Simmons will be engaged in cleaning up for several weeks to come. They will, no doubt, take out in the neighborhood of $20,000.....Parties from San Francisco have been, and some are still, in Josephine county, looking at the mines, with the intention of purchasing. Bybee & Skeeters were offered $6,000 for their claim..... Rast & Critcser will work the Steam Beer mine, in Leland precinct, all reports to the contrary notwithstanding, and have employed Ben Parker as superintendent. These mines are paying well, and have already proven valuable property.

UTAH.

MARYSVALE.—*Southern Utah Times*, Aug. 14: At Marysvale the signs are again propitious. The Connecticut people who bought the Copper Belt property and put in a mill will probably purchase the Deer Trail and consolidate the 2 groups. Mean while work is to go on in some shape.

GOOD.—The mining horizon of Utah never was brighter all around. The news from Silver Reef is very encouraging. The Christy company has 2 years' work in sight. Their mine, at a depth on the dip of nearly 1,000 ft, are better than ever.

FRISCO.—Frisco continues to turn out bullion steadily. Both the Cave and Carbonate are improving, but the center of interest has momentarily shifted to Copper gulch, over the mountain. The outcrop of the big copper vein is 50 ft wide and more than 2,000 ft long, the country being a soft friable granite, and mixed through the copper pyrites carrying silver. Being much lighter, they can be easily separated, the vein furnishing the needed water. Tom Couch, superintendent of the North Horn Silver mine, says, without hesitation, that there is a large profit to be made in concentrating and matting these ores on a large scale, but it wants money for plant.

PARK CITY.—Cor. Salt Lake *Tribune*, Aug. 19: The Ontario mine has lowered the water to the 800-ft level, and miners are taking out ore faster than the mill is reducing it. The shipments of bullion from the Ontario for the month of July, aggregating $275,000, is the largest ever sent out in one month.....The Walker & Webster mine is working a small force of men.....The Lowell is looking sp'endid, and is also working a small force of men.....On Pinyon hill it is very quiet. It is understood that the Pinyon has passed into the hands of a new company, and that a proposed compromise may soon stop contests and make Park City a very lively mining camp. This is the rumor, at least.....The Empire has a small force of men at work, but the great life of Park City is the Ontario, with its immense mining and milling operations. The tunnel is now in a long distance, and the beading is regularly advanced each day. The new pumping and hoisting works are being put in readiness for use, and it will not be many months until the mine will be drained by the new shaft now being sunk at the new works.

A White Pine Bonanza.

The prettiest piece of mining property anywhere to he found, is that owned hy the Monitor Mill and Mining Company, of Taylor district, 11 miles from Ward, in the Schell Creek range of mountains. The owners, Robt. Briggs, W. G. Lyons and W. N. McGill, may have heen "close hauled" while attempting to hring this abandoned piece of mining property to the front, hut such is no longer the case. Under what might he termed the most disparaging circumstances, they "pulled through." It was a case of ignoring the fact that others had failed in the same district and staking all on the proposition that they were right and that the first locators were wrong. That the present owners were right, there is now ahundant proof. The ten-stamp mill they have erected on Steptoe creek (run hy water power), is now turning out, on an average, $1,000 a day. They are out of deht, and the roughest eatimates show that there is still $100,000 in sight in the Monitor mine alone. They also own three-fourths of the Gore ground, in which a large hody of ore is exposed. The ground covered hy the Monitor patent was at one time owned hy the Alameda Mining Co., hut it having been ahandoned hy that company long enough to become relocatahle, was taken up, and a patent taken out for it hy the present owners as soon as the necessary work was performed.

They next cast about for milling facilities, hut not having more money at the time than three men ought to have who propose huilding a mill, it was necessary to go slow. One of the first steps taken was to secure a mill-site, hut the owner of the ground finding it was really wanted, raised the price from $100 to $1,000. They procured a 10-stamp battery, three pans, etc., from the old leaching mill helonging to the Martin White company, and other mill machinery was secured at Rohinson. With this ill-assorted collection, together with parts it was necessary to huy new, the mill was huilt. In the meantime a ditch a mile in length was dug, hoarding houses, etc., were erected, and work was also going on at the mine. By the time all was in readiness, a no inconsiderahle indehtedness had heen incurred. The mill has since turned out close on to $100,000, the projectors having got back what they put in, all indehtedness has been paid, they are money ahead, and, as ahove stated, there is $100,000 in sight in the Monitor mine alone.

Lately another ditch has been dug, hy which 66 additional feet pressure will he obtained. This has heen rendered necessary, as a rock hreaker will soon he put in, and possihly five more stamps. It can he safely said that ores are worked cheaper in this mill than in any in this State, hut when the rock hreaker is put in the cost will he still further reduced.

The ahove result, brought ahout as it was, is well calculated to make the former timid owners feel had.—*Ward Reflex.*

Remarkable Tunnel.

Last week, while in the mountains, we came to the tunnel heing run into the mountain hy Mr. Wehh, who resides near Pocahontas. He has heen at work on the tunnel for over four years, and has it now completed for a distance of 1,000 ft. In company with the owner, we entered the tunnel and paseed through to its end, where he hae at laet etruck pay dirt. For the last four yeare he hae heen working all alone—not a soul within a mile of him—and he still continues at his lonesome work. What eurprised us the moet was, that although the tunnel rune through gravel for the entire distance, there has scarcely heen any timhering done. We would venture to say that, aside from the track, there is not a cord of wood in the entire tunnel. This makes the work extremely dangeroue, and men cannot he hired to work with him. While approaching the end of the tunnel, we encountered a strong hreeze which we could not account for, and, upon inquiry, found our guide as much at a loee to account for it ae we were. Besides the main tunnel, there ie a crosscut of eome 500 or 600 ft. which we did not care to explore. At the point where he ie now at work the tunnel is ahout 150 ft. from the eurface, and ie as cold ae Iceland. Ahout a half mile helow the tunnel is one which is fully ae long, hut hae heen deserted for the laet five years. Mr. Wehh feels confident he will yet etrike it rich, hut we would rather take ohanoee on getting rich some other way than to work in euch a place.—*Bedrock Democrat.*

A GREAT MINE.—The Dosorie, at a depth of 190 ft. helow the earth'e scalp, showe four feet of ore, which yielde at the rate of $1,000 per ton, silver. These are facts, vouched for hy Mr. Francie, the foreman, Supt. P. A. Craigue and Mr. Greenwell, of the Blue Dick mine. Thie mine is ahout 12 milee south of Prescott. —*Prescott Courier.*

THE total receipts of precioue metale by the banks of Salt Lake for the week ending Auguet 11th, aggregate $113,375.52, heing an increaee over the previoue week of $6,842.61.

VAST ruine have heen discovered in the Zulu conntry, in South Africa—oheliske, with coloeeal carvinge, terracee and halle of hewn etone, or cut out of the solid rock. The nativee regard them with myeterioue awe, and keep atrangere from them, for fear that if they are approacbed no rain will fall for three years.

A Myth Made Real.

Since the discovery of the Divoll honanza, all lesser finds have seemingly failed to attract attention or create excitement, although many large pockets have been handled. The fact of the matter is, the puhlic little knows of the immense amounts of gold taken out and shipped from Tuolumne county through puhlic carriers and private hands. The movements of precious metals have in all ages heen made in secrecy. The Chinese, through Wells, Fargo & Co., ship daily from the Pacific coast $60,000—the lesser amounts conveyed hy individuals not being made note of. Figures to marvel at!

With such amounts of gold as have heen secretly carried away and publicly shipped from our mines for the past and present, is it fair to say that Tuolumne county has no mining property worth looking at?

And now comes Dr. Draper with another good thing—a golden mummy from the mythical past. The story is hest short, the only detraction in the matter heing the omission, for the present, of the precise locality to the puhlic, for important reasons of the owners; snffice it to say, however, as a feeling of good faith, we have been advised of all the facts in the case, and their outward appearance is seemingly heyond dispnte.

In 1852 a party of five unknown miners were working in the bed of one of our rivers, where they took out a large amount of gold—one chunk weighing fifteen hnndred dollars, with quartz attached. It is well known that in those days little, if anything, was known ahout gold-hearing qnartz hy the common California miner. However, the proof of the pudding was in the eating, and to find the common carrier of this gold was a question which sorely puzzled them. Ahove their olaim to the right was a large conical mountain, standing with nearly perpendicnlar sides, and rising 2,000 feet ahove the river, where the miners supposed the gold to come from which fed the river. To ascend this for the gold-hunt was attended with great danger and difficulty—having to cut steps for a foothold in the solid slate rock to the top. Upon arriving at the summit the scenery at either quarter was grand, as far as the eye could reach. But scenery was thin gruel to miners hungry for gold, and they had no stomach for it when such an inviting spectacle lay exposed at their very feet. Here the footsteps of man had never hefore intruded. Mammon was the only god who had hid in this secluded basin this vast profusion of yellow, shining, glittering gold, and had nsed the elements of the storm-king as a milling process. Here truly was a picture for *high* art.

They collected $30,000 in a short time, and covering np their footsteps as they descended, returned to San Francisco. Here, shortly after their arrival, one of the party died; not, however, until he had made a map and given a description of the mine to his wife, and also the fifteen hundred dollar specimen.

In the meantime the surviving four parties returned for more lucre, and it was on their homeward trip to the "Bay" that they were mnrdered not far from the claim hy a nnmher of Mexicans, (supposed to be the hand of Joaquin Muriata), with a large amount of gold in their possession—the graves of these nnfortunate men heing well known to the old residents of the locality, which partially confirms the statement.

How many "Will-'o the-wispe" and "wild-goose chases" in the shape of hig deposits have minere followed without successful termination! The air is teeming with them from "Gold lake" up—a period covering 33 yeare in California. The one under our present notice ie the firet of the many "eecret expeditions," in our mind, that hae heen realized.

By eome unexplained means Dr. Draper hecame acquainted with this legend, and also the widow of 30 yeare' bereavement. The interview was satiefactory, and the identical $1,500 lump, which had been religiouely kept, produced.

Six weeks ago, armed with the description and map ahove alluded to, in company with four others, he had no difficulty in finding the deserted claim, and located the ground. In lese than eix daye' work, lowering the ore with ropee down the mountain side, they have taken from the mine the round eum of $65,000, which the receipts of the San Francisco Mint in Draper's poseeesion will ehow. The doctor also informe ue that there ie at leaet 100 tone of rich ore on hand ready for the milling process. This claim will undoubtedly develop the bose bonanza of the State.—*Tuolumne Independent.*

AT the Cornwall copper mine, in Miecouri, miners get $1.35 per day; ore dreesers, $1.15; pickere, wheelere, and car hoye, 75 cents. The cost of a ton of dreesed ore at the mine is $21.11. The coet of smelting ie $65.62 per ton, or $3.28 per pound of refined copper. The output ie 30 tone of refined copper per month. The ore worke 20 per cent. The coet per ton of refined copper is $171.17, or $8.56 per pound.

WORK is to he resumed on the Little Chief mine, on the Dogtown ridge, Butte Co. Should rich gravel he etrnck in the mine, there would be an enhancement of valuee to locations all along the line of the divide upon which it is eituated, and an old-time mining revivification may he looked for in thie vicinity, ae the mines there are drift mines.

Twist Drills.

Twist drills are not, as is usually supposed, of the same diameter from end to end of the twist, hut are slightly taper, diminishing towards the shank end. Tho taper is usually, however, so slight as to he of little conseqnence in actual practice. Neither are twist drills round, the diameter being eased away from a short distance hshind the advance or cutting edge of the flute, hackward to the nsxt flute, so as to reduce the friction of the sides of the drill upon the hole, and give the sides of the drill as much clearance as possihle. The advance edges of the flutes are left of a full circle, which maintains the diameter of the drill and stsadies it in tbe hole. If, from excessive duty, that part left a full circle should wear away at the cutting end of the drill, leaving the corner of the drill rounded, tbe drill must he ground sufficiently to cut away entirely the worn part, otherwise it will totally impair the valne of the drill, causing it to grind against the metal, and no amount of pressure will cause it to cut. The advantage over other drills possessed hy the twist drill is that the cuttings can find free egress, which effects a great saving of time, for plain drills bave to he frequently withdrawn from the hole to extract the cuttings, which wonld jam between the sides of the hole and the sides of the drill, and the pressure will frequently become so great as to twist or hreak the shank of the drill, espscially in small holes. In point of fact, the advent of twiet drills has rendered the employment of the flat drill for use in small holes (that is to say, from three-eighths of an inch downwarde) totally inexcusable, excspt it he for metal so hard as to require a drill tempered to suit the work. Other advantages of the twist drill are that it always runs trne, reqnires no reforging or tempering, and, hy reason of its sbape, fits closely to tbe hole, and hence drills a very straight and smooth hole; and, having a line drawn down the center of each flute, it is easy, nsing the line as a guide, to grind the drill true, and not one-sided. It is also not liable to he influenced so much hy an air or other hole, or soft spot whioh may exist in the metal heing drilled. These qualifications render the twist drill a very superior tool for the finer classes of work, and for suoh pnrposes as drilling metal away to form a keyway or slot; for in the latter oase the holee may he drilled so closely together that they will run one into the other. A common flat drill is incapahle of performing such work. Twist drills will drill brass admirahly, providing the cutting edge is made long hy grinding it well hack on the diameter of the drill, that is to say, by making the two cutting edges stand at a more acnte angle one to the other. The twist drill will not, however (in holes of a moderate depth, that is to say, holes whose depth is not more than four times their diameter), do so mnch dnty in a given time as a common drill; especially in iron or steel, if the latter be slightly lipped; the reason bsing that the latter, stronger in proportion to its diameter, will stand more strain, and may therefore he fed much more rapidly in all cases wherein the depth is not too great to permit the cuttings from finding egress hefore becoming jammed in the hole.—*Rose's Comvlete Practical Machinist.*

Lead Smelting in the Brittany Furnace.

A variety of tbe Flintshire reverberatory furnace, hut with three doors along the front side only, is known as the "Brittany furnace," from its former use in the province of Bretagne for the smelting of a galena, containing from 12% to 18% of iron pyrites. These furnaces are usually huilt of large hlocks of granite, beld together hy tie-rods.

The Brittany furnace, though generally of smaller dimeneions, yet otherwise resemhles the Flintehire furnace, for the hearth slopee from hoth ende and from the hack of the furnace towarde the front eide, while the lead kettle is situated, ae hefore, under the tapping hole in front of the middle door; but the charge ie introduoed onto the hearth through the side doors, inetead of through the roof; and the manipulation pnreued in the emelting of galena with thie fnrnace differe eomewhat from that observed when smelting it in the Flintshire fnrnace, inasmuch as the temperatnre employed in the Brittany ie generally lower than in the Flintehire furnacee, and the metal ie tapped off eeveral times during the emelting operation.

The course adopted in Bretagne conciets in gradually heating the charge upon the furnace hearth until it begine to soften, upon which it is vigorously rahhled, when a quantity of metal eeparatee hy the reaction of plumhic oxide and sulphate with plumhic sulphide, according to the reaction already formulated; and the metal so redneed is drawn off into the lead kettle ont eide the furnace. Thie rahhling is succeeded by a second period of oalcination, lasting ahout two houre, when the mase is again vigorously rahhled or etirred, with the reduction of a further quantity of metal, ae hefore, which is again tapped from the furnace; and these calcinations, each one conducted at a higher temperature than that previouely employed, and followed hy etirring, are continned for ahout 13 hours, the reduced metal having heen run out after each rahhling of the mase; and at the end of this period, an excess of oxidized compounds of lead exiets in the charge, for the reduction of which a quantity of wood and coal-elaok is thrown into the furnace, when, after the separated metal hae again heen tapped off, the charge ie subjected to a laet roasting and etirring before the gray slag is withdrawn from the furnace. The gray slag still retains from 35% to 40% of lead, chiefly as plumhic sulphate and silicate; and after the treatment of the slags in the cnpola fnrnace, the total yield of metal hy the Bretagne process yet falls short of that obtained in Eogland in the Flintshire fnrnace.

The lead is generally purified hy stirring or poling with wood; the skimmings so produced, and which contain snlphides of lead and iron, with sulphur and particles of the unreduced ore, heing removed as they collect at the surface of the metal. But copper, antimony and arsenic cannot he removed hy this treatment; and for their removal, when present, it is necessary to refine the lead.

Precipitating Gold.

In Aaron's "Leaching Gold and Silver Ores," in the description of working gold ores, the following method of precipitating gold is given: On heginning the leaching, ahout a dozen gallons of the solution of iron sulphate is let into the gold tuh. The gold is precipitated as a hrown powder, which, however, reqnires many hours to settle. The ohject of putting the precipitant into the gold tuh in advance, is to decompose the gold solution, and precipitate the gold ae soon as it enters the tub, so as to lessen the loss hy absorption into the wood hy an accidental leak, or an overflow; also, to neutralize the free chlorine in the lixivium.

When the solution flowing from the leaching vat has become colorless, or hefore, if much copper is present, a little of it is received from the hose in a glass vessel, snch as a heaker, tumhler, or ore sample hottle, and some solution of iron sulphate is added. If gold is present, a dark cloud is produced, either instantly or after the lapse of a few seconds. When only a slight discoloration is produced in the lixivium hy the addition of iron snlphate, it is hetter to divert the stream into one of the extra gold tubs, or "gold wash-tubs," because the metal ohtained from very weak lixivinm is so extremely fine as to settle witb difficnlty, and even to pass through a filter. The leaching is continned until not a trace of gold can he detected in the lixivium ooming from the vat.

I will here call attention to a circnmstance which was observed in my works. After the leach ceased to show gold hy the iron sulphate test, if the discharge was stopped for a few minutes, and again started, the solution would again give a considerahle precipitation on heing tested, but in a few minutes would again fail to show even a trace, and this could he repeated several times. It was due to unequal percolation, and is mentioned here in case the same might oconr in other works.

The solution in the gold tuh is well stirred with a wooden paddle, and, after waiting for a few minutes to allow the gold to settle a little, a sample is taken in the glass, and tested hy adding some iron sulphate. If any discoloration is produced, more iron sulphate is needed in the tuh. If none, yet, as an excess does no harm, it is hest to make sure that there is enough of the precipitant hy emptying the glass, rinsing it once or twice with the liquid from the gold tuh, taking another sample, and testing it hy adding some of the strong solution of gold, whioh, it will he remembered, was set aside at the heginning of the leaching. If a dark cloud is now produced, it is certain that enough of the iron sulphate has heen used in the gold tuh. If not, it ie safest to add another hucketful, mix thoroughly, and try again. By taking the trouble to make this check teet, an expensive accident may be avoided.

The gold eettlee hetter if the stirring ie repeated after an hour or two, and it is advantageous to add a few pounde of sulphuric acid. If, in stirring, a circular motion ie imparted to the liquid, nearly all the gold will settle near the middle of the tuh. The gold requiree from 24 to 48 houre to eettle.

The weak leach in the wash-tuh may he treated with eome of the iron enlphate, to throw down the emall quantity of gold which it containe, which must then he allowed abundant time for settling; or it may be raieed hy meane of a wooden or leaden pump, and used to hegin the leaching of the next charge of ore. A third way, which suggeets itself, hut has not heen tried, except, ae will be eeen hereafter, in connection with the extraction of silver, ie to precipitate the gold, together with any remaine of copper, etc., which may he present, hy an addition of calcium polysulphide, the preparation of which will be decribed in ite place. A great excess of the precipitant ehould he avoided, hecauee the gold tereulphide which it produces is somewhat soluhle in calcium polyenlphide. The precipitate ohtained in thie way would prohahly settle more rapidly than the other.

ARCHIMEDES.—Archimedes said: "Give me whereon I may etand, and I will move the unireree!" Ferguson, a celehrated aetronomer and naturaliet, was accuetomed to amuse himeelf hy calculating that if, at that moment when Archimedes pronounced these worde, God had taken him at his word, in furnishing him with a standpoint at the dietance of 9,000 miles from the center of the earth, with materials of snfficient etrength, and a counterpoiee of 200 lbs., this great geometrician wonld have required a lever of twelve quadrillions of miles—12,000,000,000,000,000,000—and a velocity at the extremity of the long arm equal to that of a cannon hall, to raise the earth one inch in 2,700,000,000,000 yeare.

NUMEROUS mining eales occur at Salt Lake City, Utah.

The Engineer.

A Matter that will Bear Investigating.

Every engineer of extended experienco can call to mind circnmstances connected with tha testing of steam boilers whicb are puzzling in the extremo, and for which we have saen no satisfactory explanation. It would be possible, perhaps, to trump up a theory in regard to the causes, but thoories are cheap and not satisfying. A theory is in most cases a mere guess withoutknowledgeof tbecircnmstancesor details of tha business, and is entitled to just as much consideration as any other guess. We will cite a case containing, in our opinion, matter for reflection.

In 1857 we were on a small steamer of about 500 tons burden when the boilers were being tested. These were regular flue and return-tubular boilers, with water bottoms, such as are in common use. The pressure put on by the hydrostatic pump was about 70 lbs., and all appearing in good order, tho boilers were passed as safo at 40 lbs. pressure. Thore were a few small leaks in the bottoms around the stay bolts, and tbsso tbe engineer considered dne to the cold water; that is, the contraction caused by it in the soveral parts. He had a cape chisel in his hand, and was chatting with the writer, idly dancing tbe ohisel up and down on tbe water bottom, when snddenly it went clear through the water bottom into tbe boiler. Surprised at this he followed the indication given, and discovered tbat the wholo water bottom was no thicker than sheet-iron, and that holes could be rammed through it by a chisel held in tho hand much moro easily than one could drive a bole throngb good sbeet-iron. This is a fact, as we can personally testify, having witnessed it. Just at this point the puzzlo begins. "The strength of any strnctnre ie that of its weakest part," and "the pressuro in a boiler is greatest at the bottom, by reason of the wsight of water in it, in addition to tbe statio pressnre." In defiance of these, a sheet of iron four fect square and not of an average thickness of one-eightb of an inch sustains the same pressnre as iron five-sixteentbe of an inch thick in tbe same etructure, and with no difference in the staying or form to justify it.

Wo confess that we cannot acconnt for thie, and althongh we have spoken to many who should be able to throw some light npon it, it is a riddle tbat, in our experience, has alwaye been abandoned without any sttempt to solve it. Tbere is a solution to it, however, and those who are qualified can do the profession great service by furnishing it.

Flying.—Mr. Moy recently delivered a very interesting leoture before the Balloon Society of England. Tbe lectnrer commenced hy remarking that it is now 99 years since the invention of balloons, and that there has bsen scarcely any practical improvement made in balloons during that time. Mr. Coxwell's plan of converting the halloon into a parechnte, for the purpose of effecting a safe and rapid dsscent, and tbe invention of the trailing rope for land and drag for water, in order to keep the altitude constant, heing the only inventions worth mentioning. He snggested that the weigbt of the net migbt he ntilized, and the net dispsnsed with by slightly adding to tbe thickness of the material, and providing loops to which to attach the ropes for the car near the neck of the halloon. Mr. Moy then spoke npon "dirigible halloons," whiob, he said, should he called "dirigible aerostats," and pointed ont ssveral important improvements whioh might he made in this form of vessel, showing that there was nothing to hinder a snccessful vessel heing constrncted of not less than 12 tous lifting power, with common coal gas s. g. 420. The lectnrer then passed on to the subject of mechanical flight, and said he would hegin with facts. 1. It is a fact tbat there are no examples in nature of flying by displacement. 2. Flying is entirely a mecbanical operetion. 3. The area of tbe plane is not the index of its snstaining power. 4. Some birds fly for long intervale without any exertion of mechenicel force. The two first faots heing self-evident, he spoke upon tbe third and fourth, proving the third fact hy means of his pendulum experiment with, first, a fixed plane, and, secondly, a rotating plane. The disoussion wns opened hy Dr. Pole, F. R. S., who expressed himsslf very mucb pleeaed witb the ahle menner in which the eubjsct had heen bandled, and the eound mechanical views which had been expreeeed hy the leotnrer.

Reversing Engine Wheels.—Experimenta lately made at Blackburn, England, with a train mede np in imitation of that of tbe exprese which ran into the train etanding in Blackburn etation, to teet the etatement of the driver that reversed hia engine ea aoon ae he fonnd the brakee did not check his train, are of some intereat, tbough they elicited the fact that the reversal of an engine of a train running at a high velocity hae hut a very emall effect in reducing the epeed. A higb epeed wae attained, and the engine wae reversed a quarter of a mile before reaching the etation, hut the train ran tbrough the station at ahout 20 milee an hour, and had to he etopped by the brakea. Locomotive driving wheels, when rnnning the reveree way, are not effective in etopping a train. The experiment abowa how little can he gained by reveraing an engine under euch circnmetancee. —*Scientific American.*

Useful Information.

How Red-hot Iron May be Handled.

Mons. I. Fonteille, late President of the Physical and Chomical Sociaty of Paris, has left tha following on record:

Abont the year 1869, one Lionstto, a Spaniard, astonished not only tha ignorant, but chemists and otbsr men of science in France, Germany, Italy and England, by tbe impunity with which he handled red-hot iron and moltan lead, drank boiling oil, and performed other feats equally miraculous. While he was at Naples he attracted tho notice of Professor Semeuteni, who narrowly watched all his operations, and endeavored to discover his secret. He obsarvod, in tbe first place, that whon Linoetto applied a piece of red-hot iron to his hair, densa fumes immediatoly rose from it, and tbe same occurred when he touched his foot witb tbe iron. He also saw him place a rod of iron, nearly red hot, hetween bis teeth without hurning himself, drink the third of a teaspoonful of boiling oil, and taking np molten lead with bis fingers, place it on his tongua without apparent inconvsnience. Sementeni'a efforts, aftar performing several experiments upon himaolf, were finally crowned with success. He found that by friction witb sulphuric acid diluted with water, tbe skin migbt be made insonsible to the action of the heat of red-bot iron; a solution of alum, ovaporated until it hecame spongy, appeared to be more effectnal in these frictions. After having rnhhed tbe parts, which were thns rendored in some degree insensible, witb bard soap, he discovered, on tbe application of hot iron, tbat their insensibility was inoreased. He then determined on again rubbing the parts witb soap, and after this found that the hot iron not only aocasioned no pain, hnt that it actnally did not hurn the hair. Bsing thus far satisfied, the professor applied bard soap to his tongue until it became insensible to the heat of tbe iron, end after having placed an ointment composed of soap mixed with a solution of alum upon it, boiling oil did not burn it. While the oil remained on the tongue, a slight hissing was heard, similar to that of hot iron when thrust into water; the oil soon cooled, and migbt then he swallowed without danger. Several scientific men have since snccessfnlly repeatsd the experiments of Prof. Sementeui.

The Durability of Wood.—Cbarred wood, or charcoal, is almost indestructible, whether exposed to the air, huried in tbe ground or placed under water. Wood, in its natural state, well seasoned and kept dry, may he eaten up hy worms; if wet and dry, alternately, it rots; if kept wet all tbe time it lasts a very long time, thongh how long nobody knows. One of the pilas of a hridge built across tbe river Danube hy tbe Emperor Trajan, wben taken up, in recent times, was found to he petrified to tbe depth of three-fourths of an inch; hut the rest of tbe wood was little different from its ordinary state, though it had heen driven more than 16 centuries. Tbe oldest wood hearing the marks of human lahor is said to have bsen found in some of the tombs at Thebee, and comprised two wooden statues, a little larger than life. The oldest timher afloat is probably a sbip now sailing from Holland that was built in 1563, wben the Prince of Orange was fighting Philip II., of Spain. In digging away the foundation of old Savoy palace, which was built nearly 700 years ago, the whole of the piles, consistiog of oaks, elms, beech and chestnut, were found in a state of perfect soundness, as was aleo the planking which covered the pile heads.

How to Keep Bouquets.—Tbere are various receipts for keeping bonquets fresh. Some people etick them in moist sand; some salt the water in the vases, and othere warm it; others, again, use a few drops of ammonia. My rule is, to cool tbe flowers thoroughly at night. Wben the long day of furnace heat has made tbe roses droop and tbeir stems limp and lifeless, I clip tbem a little, and set them to flost in a marhle hasin full of very cold water. In the morning tbey come out made over iuto crisp heauty, as fresh and hlooming as if just gethered. All flowers, however, will not stand this water-cure. Heliotrope hlackens and falls to pieces under it; azaleas drop from their stems; and mignonnette soaks away its fragrance. For theee I use dry, cold air. I wrap them in cotton wool, and eet them on a ahelf in tbe ice-cheet. I can almost hear you laugh, but really I am not joking. Flowere thus treated keep perfectly for a week with me, and often longer.—*St. Nicholas.*

Starting a Fire in Still Weather.—All houeekeepere have at eome time realized the difficulty of lighting a fire in a etill, damp morning, when the obimney will not draw, and vigoroue blowing provee ineffectual. Science explains the trouhle ae "caueed hy the difficulty encountered in overcoming the inertia of the long column of air in the pipe or cbimney by the small column of air tbat can he forced up througb the interaticea of wood and coal, at the hottorn of which the fire ie kindled." Thie may be remedied hy fist lighting a few hits of shavinge or paper placed upon the top; thue, hy the heated air'a forcing itself into the chimney and eetabliehing there an upward current, the room ie kept free from the gae or amoke which is eo apt to fill tbe room, and the fire can then he lighted from below with good enccesa.

What is an Ingrain Carpet?—Tho two-ply ingrain known to the trade is a fabric composed of two webs or plies of cloth made witb different colored yarns—say, one ply green, tho othar red—of equal consistence of texture, united at tbe edges of selvages of each by tho selvage threads, and ingrained or nnited at different parts of the cloth, wherever called for by the design or pattern. If tbe rod ply represents the ground color of the design, than tbn green will be the figuro color; and wbsnever the green figuring ply appears over tbe red ground ply, that is ingraining. Tho more general tbis ingraining or mixing up of tbe two webs or plies, tha botter tha fabric is ingrained, and the longer it will wear. Tho three-ply ingrain is mado and ingrained after the same manner. A two-ply carpet, wovon on the same loom and "mounted" in tbo samo manner as a two-ply ingrain, if woven plain, without any design of pattern, would ha a seamless bag, or two bags joined together hy one side of each.

Restoring Faded Ink.—A valuable discovery has been recently made, whereby the fadod ink on old parchments may bo so restored as to render tbe writing perfectly legible. Tho process consists in moistsning tho paper with water aod tben passing over thn linee in writing a brush which has been dipped in a solution of sulpbide of ammonia. The writing will immediately appear quite dark in color, and this color, in the case of parebment, it will preserve. Recorde wbich were treated in tbis way in tbe Germanic Mussnm in Nuremhurg, 10 years ago, are still in tbe same condition as immediately after the application of tbe process. On papsr, however, the color gredually fades again; hut it may be restored at pleasure by the application of the snlphide. The explanation of the action of this substance is very simple; the iron which enters into the composition of tbe ink ie transformed hy the reaction into the black snlphide.

Organic Matter in Water.—Dr. Heish, being informed hy a lemonade manufecturer that he had suddenly found it impossible to make an article tbat would keep, experimented upon the water nsed, nnd found that a few grains of pure suger would cause it to be filled in a few hours with small spherical nucleated cells. It turned out that the water bad heen slightly contaminated with sewage. A minute qnantity of sewage water to a sugar solution soon brougbt forth similar cells. Filtration througb the finest paper would not remove the germs, nor would boiling for balf an hour destroy the vitality. Filtration through animel charcoal, however, removed them.

Driving Nails into Haro Wood.—Tbe editor of the New Genesee *Farmer* has lately witnessed an experiment of driving nails into hard seasoned timher, fairly dried. He says that tbe firet two nails, after passing through a pine hoard, entered ahout one inoh, and then donbled down under the bemmer; hut on dipping tbe points of tbe othor six or sight nails into lard, every one was driven home without the leest difficulty. Carpsnters wbo are engaged in repairing old buildings, sometimes carry a small lump of lard or tellow for this purpose on one of thsir boote or sboes.

Good Health.

Preventino Consumption.—It is not intended to give a chapter on this dire disease, consnmption, helieving that a few words on its prevention will he more useful. To insure success, we must begin with the infant subject—the offspring of healtby ancsstors. Protect in infancy with soft flennel next the skin, snd let it hreathe only pure air. In youtb teach it that good health is the greatest earthly hlessing; without it there can hs no enjoymsnt of life, and with it there cen he no complaint of its defects. Teech it that good healtb, like an estate, may he equandered little hy little until it is hankrupt. Teach it that temperance in all tbings is essential; that there can be no violation of the laws of nature with impunity. Teach it to sit and walk erect, that the cbest may be fully expanded. Do not suffer the clothing to he so tight on the chest or body as to interfere in the smallest degree with tbe expanaion of the lungs. To keep the feet dry, use tbick, oiled leather, loosely applied. Exercise several hours every day in the opsn air. Choose virtuous and cheerful companions, with whom einging and laughter may he indulged in; and finally, take time to eat and masticate your food well.

Trees and Drainage.—Saye tbe Leffel *Mechanical News:* It would now appear that treee growing near draina oarry off the eewerage water. A gentleman whoae cees-drain waa contructed just like his neigbbor's, and in the eame kind of soil, had fonnd it unnecessary to clean it ont, while the others had to hc cleaned out frequently. An examination ahowed that tbree large trees, whose roots had penetrated into the vicinity of his eecond, or waste cess-pool, were clearly the channele through which the waste all eacaped. Whether it was changed into plant food, as ie likely, or waa exhaled through the leeves—in either caee it was diaposed of witb equal safety.

Carbolic Acid on the Street.—In London, Eagland, dnring hot weather, crowded and filthy atreete are sprinkled on alternate daye with a weak eolution of carbolic acid.

Digestion of Food.

Dr. E. M. Hunt, of Mstuchsn, N. J., in a paper read bsfore the Sanitary Association, thus generalizes the facts of digestion:

"Food should pass into tbe stomach in a finely divided state. The rapidity with which digestion is performed depends upon the various circumstances. Strong omotion, as anger or grief, will retard it; moderate exercise hastens it, and thus the state of both hody and mind influences it. A nsual meal is gensrally digested in a healthy person in from three to five hours. A mixture of food is not especially objectionable, except as by varisty it encourages the appstite, and often leads us to cousume more than is needful. Animal food is digested more quickly thau vegetable, and solid food more epesdily than soups. Oily food is more quickly appropriated by tho system than muscular fiber, when agreeing with tho stomach. Uncooked oil is more digestible thau cooked. Cream and hutter are the purest of oils. Boiled meats are the most digestihlo, roested next, broiled and fried the least so.

Bulk is nccessery to digestion. The people of cold climates, who live much on fat meats, mix crude matters—sometimes evon sewdust—with them, and tbus find tbem more readily digested. Milk is among the most nutritious and digestihle of foods. It is considered constipating, but ths cbief reaeon is that it is almost entirely taken up by the eystem, and no residue left. With ths same exertion, we need richer food in cold weather thau in warm. Nevsr eat hetwesn meals, unless extra exertion or exposure require it, and then select hearty and quickly digestible food.

As a rule, ripe fruits or vegetables are more digestible than green, and green fruit etewed more digestihle than when eeten in tbe raw stats. Smoked meats are less digestible than fresh; end of smoked or salted meats, the inner portion is more eesily digested tban the outer part. The inner part is preserved as much hy the saltpeter and the exclusion of the air as hy tbe saltng end smoking process, and is in a state more allied to preserved fresb meat. Dried fruits, as prunes, raisins, apples, etc., are unfit to eat nnless well cooked, and all unbroken seeds are indigestible. Alcoholic stimuli, or condiments of any kind, are not neceseary in heelthy conditions of the stomach.

The Regulation of Dreaming.—A French investigator, M. Delaunay, finds from experiments upon bimself tbat the character of his dreaming may he controlled by stimulating various portions of the hrain hy means of heat. By covering his forehead with a layer of wadding he gets sans, intelligent dreams. He has, also, experimented on modes of lying, which favor the flow of hlood to particular parts, increasing their nutrition and functional activity. He hes observed that the dreams he has while lying on his hack are sensorial, variegated, luxurious. Those experienced when on tbe right side are mohile, full of exaggeration, ehsurd, and refer to old matters; bnt those produced when on the left side are intelligent and reesonable, and relate to recent matters; in these dreams one often speeks. Thsse obsevations may he correct so fer as Mr. Delaunay is concerned, but most people who venture to lie on their hack, especially after eating, are apt to find their dreams anything but luxurious.

Scarlet flannel is poisonous to some skins, if used hefore washing, and as one is not always sure how one may he affected hy it, it ie safer to give it a scald in bot water with a little soap—not enough to make a strong suds. Let it stand end soak a few minutes, then wring out and treat like other flannels. The smell of new red flennel is not agreeable to many, aud for this reason it is desirable to wash it before using. But no washing that we have any knowledge of can keep red flannel looking nice if used for underwear for any length of time, unless worn hy people that do not perspire freely. It hecomes badly discolored and spotted in most cesss. Washing red flannel before making up will "shrink" it as much as is desirable.

Sympathy.—Some scientific one asks: "Is not sympathy due to the action and reaction of metaloids in the system?" It is not unreasonable to liken the human organism to a leyden jar, the liver and spleen heiog the hattery wherein the metals are held in solution, the polarization heing effected hy connection through the veins and arteriea with the hrain, where thought ia generated. The hack and front braine are known to he alternately poeitive and negative to each other and to other individualitiee, which confirms the theory of the mental battery.

Sparring for Health.—Sparring ie a healthful exercise for hoth sexes, provided it is not overdone. Few exerciaea cultivate courage and firmnese like it. Practiced each day long enough to open the lungs thoroughly two or three timea, might he useful in schools. A live opponent ie not needed, tbongh auch a one is better. A hag of auitable weight and hight makea a very good dumh hexer. Four or five minutes at a time are sufficient.—*Herald of Health.*

Bathing Infants.—Recent casea are noted in the medical journals of tetanus, or lockjew, having occurred in infante on account of heing hathed in too hot water. A eingle nuree reporte aeveral casea of the kind.

Assessment Notice, Gould & Curry Silver Mining Co.

Passing Events.

A notable event chronicled in our "Mining Summary" is the discovery of stream tin in Montana, but details are not at hand concerning it. In this country tin has been found more abundant at the Temescal mines than elsewhere, but little has come from there.

We continue our letters from the Denver exposition. The second one from the Commissioner from California appearing in this number of the PRESS.

There is continued dullness in mining stock circles, though the field of legitimate mining is gradually and surely widening, and is now in a very prosperous condition.

Several very rich strikes in this State are noted of late, Sierra and Nevada counties taking the lead in this direction. California is still a mining region, where there are possibilities of great fortunes being made in mining, and its genial climate and pleasant surroundings make it a chosen home for the prospector and miner.

THE DEEPEST MINE.—The Yellow Jacket shaft, on the Comstock, at present enjoys the distinction of being the deepest exploration in America. But rapid progress to the 3000 level is being made in the joint Ophir and Mexican winze. At the 3000 level a station will be put in and drifts started, when the winze will be continued on down to the 3100 level, provided too much water shall not be encountered. Thus far all has been dry. This will soon be the deepest point on the lode and the deepest exploration in America, being lower than the Yellow Jacket.

Working Gravel from Slope Mines.

In conversation the other day with Mr. W. A. Skidmore he called our attention to an apparatus for working auriferous gravel, which he had recently met with in the course of his examination of mines. The method is used at the Napoleon mine, Placer county, belonging to Alex. Badlam, Thos. H. Reynolds and associates, and answers its purpose so well that a brief description will be useful to other miners.

The Napoleon is what is known as a "slope" mine—an incline being run down into the gravel—in which the gravel is drifted out and hauled up the incline to the surface, where it is worked. In order to work the gravel thus procured, Mr. Badlam has devised an apparatus, which, Mr. Skidmore informs us, is very effective.

The shell of an old boiler 20 ft. long and 48 in. in diameter is mounted on rollers in the same manner as the Bruckner or White revolving furnaces, so that the boiler may be rotated. The boiler is set on an incline of one inch to the length of the boiler. Inside of it are secured 13 bars of old railroad iron, placed lengthwise the boiler.

At the upper end of the boiler is placed one of Hendy's automatic ore feeders, into which the gravel falls from the bopper. An opening two feet in diameter is left at the head of the boiler, and into this the ore feeder discharges the gravel, an inch and a half of water coming in at the same time with the gravel.

At the other, or lower end of the boiler, are placed a series of radially projecting bars, which may be appropriately termed a revolving "grizzly." The diameter of the outer end of this circle is larger than the end next the boiler, so the slope of the bars is sufficient for the material to discharge freely. The length of this grizzly is four feet. It is secured to the boiler, and revolves with it. The "flare" of the grizzly is at an angle of 10°, and the outside rim is four feet eight inches wide. The space between the bars is one to one and a half inches.

The heavy and fine material falls between these bars of the grizzly into a chute, which leads it directly to the Huntington battery, where it is crushed. Mr. Skidmore says this form of battery is very well adapted to this purpose, and crushes the material in a very satisfactory manner. The cobbles and large stones pass out of the end of the grizzly to the waste dump.

Quicksilver is used in the mortars. There is also an apron, and below this undercurrents and sluices are placed. But the gold is mainly caught in the battery and immediately below it.

This gravel, though it has to be blasted out, is not the hardest variety, not being cement, like that from the deep channels. Neither is it loose, like that from Table mountain.

An engine revolves the hoiler and works all the machinery, the hoiler being revolved slowly. All stones greater in size than one and a half inches in diameter are perfectly cleaned of adhering dirt and gold by the action of the boiler before being discharged as waste. Dirt does not pack between the bars, because it will drop down from above during the revolution of the boiler. The water thoroughly cleans the rock. The fine material passes into the batteries.

This whole apparatus is automatic in its action. One man only is required to attend it. The man who keeps clear the waste at the grizzly can look after the battery. The stones, etc., are turned over about 10 times in passing through the boiler with the water before the grizzly is reached. After paseing through there is no adhesive matter left, the stones being polished.

The system is one perfected by Mr. Badlam, and the appliance gets through 35 tons a day. It will be seen that the outfit is not an expensive one by any means, and it possesses the merit of being simple in construction and operation.

DEATH OF B. B. REDDING.—B. B. Redding died suddenly of apoplexy in his home in this city, on Monday. His death will be widely deplored, for he was a man of action and of public spirit. His work as a member of the State Fish Commission gained for him popular thanks. Mr. Redding was also a regent of the State University, and a trustee of the Academy of Sciences. He was one of the organizers of the State Horticultural Society. He was looked upon generally as the friend of progressive movements for the development of the State and the advancement of knowledge. His place in the community and in popular esteem will be hard to fill.

CURIOUS ORE FORMATION.—In stoping at the 2600 level of the Union Con. mine, on the Comstock lode, where the ore is of good quality, a somewhat unusual feature is met with. The rich ore jumps from side to side of the ore streak or deposit. The men will be working in fine ore when, all of a sudden, it abruptly terminates and is found to have gone to the opposite side.

ENGINEER MELVILLE and party arrived at St. Petersburg, and are expected in Washington in about three weeks.

THE Atlantic & Pacific railroad track is completed to Pitman valley, A. T., 80 miles from Prescott.

Working Quartz.

At the foundry of Savage & Sons, on Fremont street, is an outfit of machinery for working quartz which possesses some novel features. The arrangement consists of a rock breaker, pulverizer, amalgamator and concentrator, so combined as to form a complete system for working ores.

The rock breaker is an ordinary Dodge rock breaker, such as are used in hundreds of places in Colorado and California, except that the crushing plates are studded with steel pins. As the wrought-iron plates wear away, the steel pins project slightly and take the wear of the rock. This is Mr. Dodge's latest improvement and it works well, overcoming a difficulty which any mill man will appreciate. This rock breaker is so placed as to discharge the broken pieces of rock into the pulverizer, acting as a breaker and feeder.

The pulverizer is a revolving chamber having angulated sides overlapping each other, the sides being formed of steel-shod bars of iron with spaces between. The barrel has six overlapping sides. This is not cylindrical, but is polygonal. The crushed ore is put in and with it large lumps of ore. While the ore is being ground up, the material drops off the overlapping edges of the angulated sides past the opening, the ore dropping at each lap. As one side rises all the material in it is suddenly thrown down, and is soon covered and powdered by the material on the next side. This dropping action grinds the ore up but does not "slime" it. In cylindrical crushers the pieces of quartz slide in mass, but here there is a constant dropping, the pulverization being by impact rather than attrition. As fast as the ore is reduced to proper size it passes through the screen.

From the pulverizer the ground ore is elevated into a small device with a worm feeder, which delivers it into an ordinary combination pan, but having a peculiarly arranged bottom, to prevent any flouring of the mercury. Here the gold or silver is caught. The tailings pass on down to the Dodge concentrator, where the sulphurets are caught. We have before described this machine in detail. The tailings pass off on one side, and the sulphurets on the other.

All this machine is composed of the inventions of Mr. Miles B. Dodge. So confident is he in being able to work ore at a high percentage and cheaply—especially ore that others fail to work—that he is willing to let anyone bring their ore, from a ton to a carload, and work it themselves on this machinery without any charge. He bases his claim to do this on the fact that he granulates his ore something to the consistency of cornmeal, and does not make a powder of it, so that fine metal will float off with slimes.

With the ore in the condition it is found after passing through the pulverizing chamber, no slimes are made. The capacity is 20 tons per day through a 40 mesh, or 30 to 40 tons a day through a 20 mesh. One of these machines is running at the Silver King mine, Arizona, in the metallurgical works, where it is grinding slags, salt and some of the richest ore. The cost of working, Mr. Dodge tells us, is 50 cents per ton by water-power and one dollar by steam. Mr. Dodge's claims as to the amount saved—and we have published results on several occasions—are somewhat startling, but as he is willing to prove them by working batches of ore for nothing, no one has anything to complain of. As we have said, he bases his claims on the peculiar condition in which the ore is left after grinding and on the perfection of his device for crushing it.

He is making one of large size for the Pacific mining and reduction company, who are going to ship it to Idaho Springs, Colorado, for a mine controlled by F. F. Osbiston, J. W. Mackay and others. The castings for the machinery are in the shop now. This company has also ordered one of the crushers and pulverizers to ship to Australia with a furnace outfit.

Mr. Dodge is also making a number of large crushers, one a big 8 ton machine is going into the Spreckels' refinery. He is also building two roasting and chloridizing furnaces of the pattern invented by him, and described by us some little time since. One very large furnace, 28 ft. long and 8 ft. in diameter, is going to a copper mine at Campo Seco, in Calaveras county. With this goes a rock breaker and pulverizer. The furnace prepares the ore for leaching. Another is being made for a mine in Mariposa county. This latter is a five-ton furnace, and will be used in connection with chlorination works.

The machinery will be shown to anyone interested in examining it. People with batches of ore, which it is found is difficult to work, can work it here by applying at the foundry, and can work it themselves without cost.

THE MECHANICS' FAIR.—The Mechanics' fair, in the new pavilion on Larkin street, near Market street, in this city, has had a very prosperous opening week, and bids fair to be a brilliant success throughout. The attendance is unusually large, and the visitors find a display of art, industrial products and merchandise which requires many hours of study to encompass. The plan of the new pavilion embraces many improvements which are decidedly to the advantage of visitors and exhibitors.

The Denver Exposition—No. 2.

[Editorial Correspondence].

The exposition has now, Aug. 16th, entered upon the third week of its existence, and yet not one-half of the machinery is ready to start. Most of the other exhibits, however, are complete, with the exception of a few in the mineral department. Nearly or quite two carloads are somewhere behind—about half of this amount is from Utah. The attendance is improving, both local and that from a distance. The news from the East concerning contemplated visits and excursion parties is quite encouraging. Nearly all the travel from Omaha west seems to be coming through Denver.

The Minerals of Colorado.

As might be expected, the display of Colorado ores is very large and fine, Leadville and Gilpin counties taking the lead. It is proposed to take up the description of the different exhibits by States and counties, beginning with Colorado, whose exhibits are arranged by counties; and first in importance and interest is Lake county, in which are located the world-wide

Famous Leadville Mines.

The exhibit from these mines is elegant, massive and rich, and has been arranged under the special supervision of Mr. N. W. R. Read, of Leadville, a graduate of the London School of Mines and Mining Engineers, who fully understands his profession, and who is here as Commissioner for Lake county. The wonderful mineral riches of this district are presented in a most admirable manner for study, and the display is well calculated to excite wonder and astonishment, even among those who, in other ways, have become familiar with the history and products of this, perhaps the most remarkable mining locality in the world. The exhibit is made up of characteristic ores from nearly all the principal mines of the district, the specimens from each mine being shown separately. The principal workings at Leadville, including the town, are comprised within a limit of some three by four miles in extent. The town is located on a little flat, beyond and east of which rise a series of comparatively low hills. To the left and right other small hills rise, beneath which have been found the wonderful deposits of ore, some notice of which will be given below, leaving a more full description of the mines themselves, their history, etc., to a future letter, which will be written from personal inspection.

As the visitor approaches the Leadville section, his attention is first arrested by a large glass case, five feet square at the base, and standing eight feet high. Within stands a section of a pyramid representing nearly 10 cubic feet of solid silver, and designed to show the size of a block of that metal which would be valued at $118 500, the exact amount taken out of the Robert E. Lee mine in one day, Jan. 13, 1880, the men making 17½ hours of working time. Of course that was an extraordinary yield, and from a mass of chloride ore. Upon the top of this section are placed a number of massive specimens of the richest horn silver which was probably ever brought to view. They weigh, in the aggregate, about 500 pounds, and will yield $4 500 in value, or $9 per pound. At the foot of the pyramid is a display showing: First, a box of ordinary grade ore, as it comes from the mine; then a mass of amalgam, as it is collected from the working; next a mass of pure silver, as it comes from the retort; and lastly, a solid silver brick, valued at something over $2,000. Upon the top of the pyramid, and by the side of the specimens of horn silver, is a silver brick weighing 1.866 ounces, 945 fine, and obtained from only 188 pounds of such ore as is shown therewith.

Leaving the case already described, the visitor passes on to a series of double-sided cases, arranged with shelves as high as the observer can well inspect. Within these cases the ores of the different mines are carefully arranged, labeled, and the assay value of nearly every silver or lead-bearing specimen is given. In connection with the ores are also given characteristic specimens of the enclosing rocks, which consist of porphyry and limestone, and also the intrusive porphyries, which frequently come in and cut off, or otherwise disarrange, the mineral-bearing strata.

In connection with these exhibits there is shown, by maps and diagrams on adjoining walls, a general ground plan of the mines, and also colored sections, showing the ore beds, country rock, and a portion of the underground workings. By means of these helps, the scientific arrangement of the ores, and the almost constant attendance of Mr. Read, who is ever ready to assist by verbal description and explanation, the intelligent visitor who comes prompted by something more than mere curiosity is enabled to study into and fully understand the geological history and status of this rich and unique mineral deposit. We propose, before returning to San Francisco, to visit these extraordinary mines and describe them from personal inspection; hence, for the present, our attention will be confined simply to the ores as we find them on exhibition.

Character of the Robert E. Lee Ores.

This is one of the leading mines of the district, and its ores may be described, in a general way, as silicious limonite, rich in silver, in combination, with a small percentage of bro-

mine, chlorine, iodine, and traces of copper, vanadium and barium.

The mineralogical components are limonite, silica, kaolinite, emholite, harits, cerargyrite, with occasionally such lead minerals as galenite, anglisite and cenessite—some beantiful specimens of the latter are shown from the Iron Hill mine, where this variety of mineral appears to be more common than at any other locality in the district.

Manganese oxides occasionally occur, hnt only in qnite limited quantities. Traces of zinc are also sometimes found in the form of the silicate calamine.

By far the larger portion of the ores consist of a reddish to brownish jasper-like material, often containing geodes with beautiful interiors. Light green plates of bromo-chloride of silver are often met with in the seams of the ore. The average yield of this class of ore is from $25 to $100 to the ton for low-grade ores, and from $100 to $1,000 for high-grade.

The horn silver of the Robert E. Lee sometimes occurs almost pure; then again in a gangue made up of a number of dark colored minerals, shaded from black to bluish brown. Much of it is broken up, when it assumes more of a grayish tint, and is known as "gray sand," containing a larger percentage of lead. As such, it falls off largely in value. A "red sand" is also sometimes found—its color due to a larger percentage of iron—which assays still less than the gray sand.

In conclusion, it may be said that the R. E. Lee ores, and other like ores in this district, have probably resulted from the decomposition of argentiferous sulphides, in which secondary decomposed products, clay and silicious limonite, have found lodgment in the forms as described above. Some account of the geological formation in which these ores are found, the peculiar conditions under which they occur, and how they were probably deposited, will form the subject of a future letter. Oh Carbonate hill, directly east of the town.

A Large Number of Paying Mines

Occur, which are represented in the collection that we are describing. Among them may be named the Morning Star, the Evening Star, Henrietta, Carbonate Hill Mining Co., Leadville Consolidated, Ætna, Big Chief, Brooklend, Clontarf and Wolfe Tone. The two former, under the management of Mr. W. E. Ward, exhibit a very excellent series of send carbonate ores of all grades, and in all states of granulation. They assay from 25 to 400 ounces in silver, and from 10 to 73% in lead. Among these carbonates, many very peculiar nodules of horn silver are frequently found, showing a remarkable case of segregation—a gradual transformation of sulphide into carbonate.

Some hard carbonates of lead ore are presented for inspection in the cases, many of which are of great interest to the scientific observer and mineralogist.

The Leadville Con., O. H. Harker, manager, has a series of characteristic ores on exhibition. One specimen consists of heavy spar—barytes—a mineral frequently associated with lead in other districts, but somewhat uncommon in Leadville. It occurs in nodular masses, scattered in one portion of the lower workings.

The Yankee Doodle, of Carbonate hill, Geo. Summers, manager, shows carbonate ores, generally yellow in color; some rich in lead, others poor, but very good in silver, probably from chloride of silver scattered through the mass.

The Henrietta mine, of Moffet, Tabor & Co., exhibits some large masses of galena, very bright in luster, but coarse-grained.

The Wolf Tone exhibits a remarkable series of ores—galena, and several varieties of carbonate of lead. One is a highly crystalline, black carbonate of lead, and lustrous. Iron minerals also occur with the carbonates, which are very interesting from a chemico-geological point of view. They would appear to represent what is known as "gossan," the "eisen hut"—iron hat—of the Germans. But instead of appearing at the surface, they occur at a depth of some 700 ft., and *under a heavy stratum of porphyry!*

On Iron Hill,

So named from some of the peculiar characteristics of its ores, the iron silver mines are found, under the management of Mr. J. Arens; also, the Silver Cord group of mines, Tingley S. Wood, manager. The collections from these mines are well worthy of close attention. Every class of ore and every geological formation in the mine being represented; colored kaolines, chloro-bromides of silver, and cerussite, with many other minerals are found.

The Smuggler, Imes, Forfeit and A. Y. present good collections. The A. Y. exhibit is very fine, many beautiful interlacings of cerussite crystals being shown. Not only the more common gold-yellow cryatals, but those of pure white are also shown in abundance—white from the absence of iron. Some of the cerussite crystals have been changed to limonite pseudomorphs.

From Fryer hill, the Matchless and R. E. Lee show chloride and free-milling ores of all grades. To each specimen an analysis is attached, which adds much to the interest of the exhibit, enabling those interested to make the same a close study, and by comparison with ores from other mines, to arrive at very correct conclusions as to the character and value of similar minerals found elsewhere.

The Little Pittsburg, Little Chieftain and Annie mines display a series of their high-grade and characteristic ores. Many other mines are also present with well-filled cases, making a collection of great value and interest.

What an Exhibition of this Kind may Accomplish.

The Chrysolite has a splendid case of its own, made at the shops of the company, and well filled with representative ores. The maps exhibited by this company and already alluded to, when consulted in connection with the ore exhibit, enable the visitor to form a very correct idea of the location, workings, modes of deposit, ore shoots, and general characteristics of this wonderful group of mines. Mr. H. Platt, the skillful engineer at the mine, I am told has made these drawings very perfectly and with great accuracy. I have been thus somewhat more particular in describing this exhibit, as it is not only a characteristic one, but because in the arrangement of the display, with the accompanying maps, one of the most difficult geological and mineralogical problems ever encountered is made so plain that anyone at all familiar with such things can make the location a close study almost or quite as well as though he were to visit and explore the mines personally. This exhibit, moreover, shows what can be done, and how much valuable information can be conveyed by a simple exposition of minerals properly arranged, with maps, drawings, etc. What has been done in connection with these mines, may also be done in connection with any mine or group of mines in the world. If a similar display to this could be made of Comstock mines in Nevada, more information could thus be given in a few hours than can now be obtained from reading hundreds of pages of printed matter, together with weeks of time spent in underground examination, viewing ores, country rock, and mineral characteristics in place, even with an expert and intelligent guide.

It is to be hoped that enough of this collection will be left on permanent exhibition to enable future visitors to study the mines here represented, as those at present are now doing. Such a collection as is here shown, gathered from all our leading mines into a great national museum, is what is much needed—gathered into some central locality, like Denver, where the student, or the capitalist seeking investment in mines, can go and study at his leisure, and feel assured that what he sees is true and characteristic of the respective localities. Such it is proposed to make this exhibit in the future—a national enterprise—where not only the mines of gold, and silver, and lead, and antimony, etc., may be seen and studied, but where the more important minerals of iron and coal, of marble, of granite, of clays, etc, may also be seen, and some definite and reliable idea formed of their relative value and importance to the commercial needs and conditions of their respective localities. This is the work that the managers of this exposition have set themselves about to accomplish. And to aid their efforts, the various Commissioners, experts, scientists and mining men generally, who are now in attendance at this exposition, have taken steps to form a National Mining Bureau, with branch organizations throughout the different States, Territories and important mining localities within those States and Territories, which shall have for its object the collection of information, and the preparation and publication of papers on the various processes of mining and metallurgical operations, etc., with the view to advance knowledge in these departments of science and industry, and bring about a more general diffusion of information among the people of the largest, most varied and most important mineral region on the globe.

W. B. Ewer.

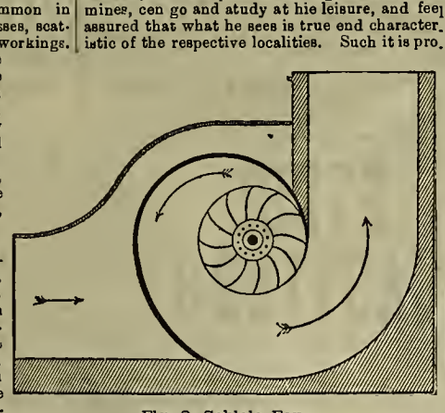

Fig. 2—Schlele Fan.

The Enreka tunnel is now in 2,054 ft.

Influence of the Moon on Plant Growth.

From the interesting work of Prof. J. P. Lesley (State Geologist of Pennsylvania), on "Man's Origin," we extract the following: "In one or two instances, modern experimental science has actually reinforced the ancient superstitious observance of the moon. It is now well understood that young plants, like human babies, must have plenty of rest. If they shoot up from the seed in the waning of the moon, they enjoy the repose of long, dark nights; if in the growing moon, their young life, overstimulated, perishes or suffers deterioration more or less. The latest observations make it certain that the sun heat reflected from the moon's face is sufficient to dispel clouds, and it must modify, therefore, notably the climate of the kitchen garden. * * These are merely instances showing how the instinct of man may sometimes anticipate the final deductions of his reasoning faculties; and we are thus taught to despise nothing, not even the follies of superstition."

Perhaps the ultimately "final deductions" of scientific men may give reasons for the popular superstitions of farmers, who regulate the planting and felling of timber, their pruning and grafting, by the phases of the moon, whilst their wives fear that all their yarn would untwist and all their soap go heck unless they consulted the almanac.

Again, the view adopted by the older botanists, that light is either without effect on germination, or has an adverse effect, fails to harmonize with some results lately arrived at by Herr Stehler, in the case of many seeds of agricultural importance, such as varieties of meadow grass (*poa*), the germination of which he finds to be favored considerably more by light than by heat. Thus, with two groups of 400 seeds each of *Poa memoralis*, in one experiment there germinated in light, 62%, and in darkness, 3%. Similarly with *Poa pratensis*, in light, 59%; in darkness, 7%, and so on. Sunlight being a very variable force, difficult of determination, experiments were further made with gaslight, and with the same result—that light favors the germination of certain seeds, especially grasses, and that these germinate either not at all, or very scantily, in darkness. The fact was verified by Herr Stehler in quite a series of seeds. *Festuca, Cynosurus, Alopecurus*, etc. In the case of seeds that germinate quickly and easily, such as clover, beans or peas, he thinks light is probably not advantageous.

Auditor Brickwedel has forwarded to the State Controller the following statement concerning the values of San Francisco property as they appear on the books of the Assessor: Value of city and town lots, $108 487,048; improvements thereon, $43,122,220; improvements on real estate assessed to persons other than the owners of the real estate, $48,500; value of personal property, exclusive of money, $42 306,636; money, $7,799,358; deductions on account of mortgages or other obligations by which debt is secured by lien on property, $28,878,061; value of franchise, roadway, roadbed, etc., of railroads, as apportioned to the county by the State Board of Equalization, $218 400; total value of all property after deductions, and after equalization by the Board of Supervisors, $201,982,162.

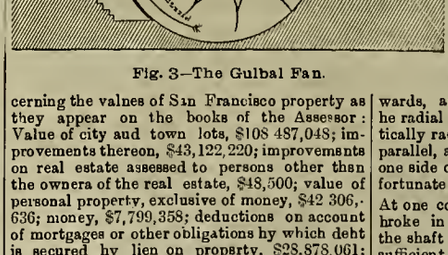

Fig. 3—The Gulbal Fan.

The city of Davenport, Iowa, formerly received an income of several thousand dollars from licenses to liquor dealers. Under the new order of things in that State this revenue is lost. An ingenious official has hit upon the plan of taxing the sale of lemonade, soda, and other beverages allowed to be sold. A charge of $50 a year is to be exacted, with a fine of $1 to $100 for violating the ordinance.

Silver to the amount of $118,000,000 is lying idle in the Treasury vaults at Washington.

Mine Ventilation.

Forms of Fans.

In continuing our description of appliances for ventilating mines, we describe this week three of the more important fans. Waddle's fan (Fig. 1) receives its air on one side only a the center, and is what is called open-running; that is, it delivers the air all around the circumference. The passages for air from the center to the circumference are nicely curved, so as to make the passage of air as easy as possible. The Waddle ventilator has its air passages through the fan with a gradually decreasing section from the center to the circumference, so that the velocity of rotation at any distance from the center, multiplied by the sectional area of passage at that distance, should be constant, with the view of keeping the fan filled up to its circumference with issuing air, and preventing the possibility of re-entries of air from the external atmosphere. Some bell-mouthing is provided at the circumference to ease the delivery. The blades are inclined backwards, and the whole structure revolves; that is, the blades and casing are all in one revolving piece. This fan is made large, and makes a moderate number of revolutions per minute.

Schiele's fan (Fig. 2) is made small in diameter and runs very quickly. The blades are inclined backwards for some part of their length, and at their tips are curved backwards. The casing is not attached to the revolving portion, and forms a spiral leading into an expanding chimney. Air is received on both sides. The blades are so constructed that the area for passages of air is uniform through the fan. The spiral casing gives a uniformly increasing space beyond the tips of the fan blades, from nothing up to the full area of the discharge aperture, and in this way provides for the continual swelling of the volume of air in the casing, occasioned by the discharge of successive infinitesimal laminæ of air round the whole circumference of the fan. Mr. C. M. Percy, M. E., having some years ago to erect a Schiele fan at one colliery that had not been equal to the requirements of another colliery, was forced to take considerable interest in it. No other fan could well have been erected. There was not space, and the foundation was too treacherous for a heavy structure.

The fan was 14 ft. in diameter, and running at 100 revolutions per minute, produced about 1,000 cubic feet of air for each revolution, with 1.2 water gauge. It proved quite equal to the wants of its new habitation, and gave no trouble. The special circumstances and the fair results obtained perhaps sufficiently explain a slight leaning towards this ventilator. Of three other Schiele fans which have come under notice, and all of which have been in constant work for several years, the following are the results: Diameter, 12 ft.; revolutions, 160 per minute; water gauge, 1.5 inches; quantity of air, 160,000 cubic ft. per minute. Diameter, 9½ ft.; revolutions, 200 per minute; water gauge, 1.2 inches; quantity of air, 100,000 cubic ft. per minute, being 500 cubic ft. for each revolution. Diameter, 7 ft.; revolutions, 275 per minute; water gauge, 1.5 inches; quantity of air, 60,000 ft. per minute, being about 220 cubic ft. per revolution.

The Guibal fan (Fig. 3) we are familiar with on this coast, it being more especially in use on the Comstock. Probably there are as many fans of this kind at work in England and on the continent as all other forms of ventilators combined, and certainly the balance of professional and practical opinion is in its favor. It is made large and worked at a moderate speed. The casing is not attached to the fan, and the air is not discharged into a spiral, but leaves the fan at one particular place through an adjustable shutter, which can regulate the extent of opening. The air passes into an expanding chimney. The blades of this fan are inclined backwards, and at the tips are curved so as to be radial with the circumference, having practically radial blades. In width the blades are parallel, and the air can be received either at one side or both. The Guibal fan has been unfortunate in several cases in the shaft breaking. At one colliery in Yorkshire two steel shafts broke in two years. It does not appear that the shaft was, either in material or in size, insufficient for its work, because for a fan 46 ft. in diameter and 15 ft. wide, the material was steel and the diameter 21 inches, which would give an enormous transeverse and torsional strength. But it did appear that the construction was bad, because a third shaft of wrought iron has already worked longer than its two predecessors. The difficulty seems to be the making so large a shaft sound, and a good plan for such large masses would be to have them hollow and manufactured from Whitworth compressed steel. Some ten years ago a screw propeller shaft for engines, indicating upwards of 5,000-horse power, was made hollow of compressed steel, and has given good results. Another difficulty very common with such large fans as 46 and 50 ft. diameter is the heating of the bearings, which is not occasioned so much by the mere dead weight, as by the weight causing deflection of the shaft, and so preventing it lying level upon the bearings,

CHICAGO **FRASER & CHALMERS,** ILLINOIS.

MANUFACTURERS OF IMPROVED AND APPROVED FORMS OF

MILL AND MINE MACHINERY.

Having made extensive additions to our Shops and Machinery, we have now the LARGEST and BEST APPOINTED SHOPS in the West. We are prepared to build from the Latest and Most Approved Patterns,

QUARTZ MILLS

For working gold and silver ores by wet or dry crushing. The Stetefeldt, Howell's Improved White, Brunton's & Bruckner Furnaces, for working base ores. Rotary Dryers, Stetefeldt Improved Dry Kiln Furnaces.

SMELTING FURNACES,

Water Jackets, either Wrought or cast iron, made in sections or one piece, either round, oblong, oval or square. Our patterns most extensive in use. SPECIAL FURNACES FOR COPPER SMELTING. Slag Pots and Cars, improved form. Bullion and Copper Moulds and Ladles, Litbarge Cars and Pots, Cupel Furnaces and Cars.

HOISTING ENGINES Large or Small for flat or round rope. Double Cylinder Engines, from 6x10 to 18x60. This latter size furnished J. B. Haggin for Giant and Old Abe Co., Black Hills also Corliss Pumping Engines, 26x60, for Hoisting and Pumping Works, for 2,000 feet deep. **Baby Hoists for Prospecting, 4 H. P. to 6 H. P.**

Wire Rope, Safety Cages and any Size and Forms of Cars. McCaskell's Patent Car Wheels and Axles—Best in Use.

Principal Office and Works, Fulton and Union Sts., Chicago, Illinois. New York Office, Walter McDermott, Manager, Room 32, No. 2 Wall St.

Frue Ore Concentrator, or Vanner Mills.

Coarse Concentrating Works, Improved Jigs, Crushing Rollers, Sizers, Trommels, Rittenger Tables, and all other adjuncts for the proper working of Gold, Silver and Copper Ores, complete in every detail.
HALLIDIE IMPROVED ORE TRAMWAYS. We refer to Gen. Custer mine, Idaho, 5,000 feet long; Columbus Mine, Col., 4,750 feet long; Mary Murphy mine, Col., 5,000 feet long, all in constant operation.

LEACHING MILLS,

Improved Corliss and Plain Slide Valve Meyer's Cut-off Engines.

CORLISS ENGINES from 12x36 Cylinders to 30x60. PLAIN SLIDE VALVES from 6x10 to 36x36. BOILERS of every form, made of Pine Iron Works C. H. No. 1 Flange Iron, or Otis Steel. Workmanship the most careful. All Rivets Hand Driven.

THE CALIFORNIA POWDER WORKS.

MANUFACTURERS OF

Sporting, Cannon, Mining, Blasting and

HERCULES POWDER

HERCULES POWDER will break more rock, is stronger, safer and better than any other Explosive in use, and is the only Nitro-Glycerine Powder chemically compounded to neutralize the poisonous fumes, notwithstanding bombastic and pretentious claims by others.

It derives its name from HERCULES, the most famous hero of Greek Mythology, who was gifted with superhuman strength. On one occasion he slew several giants who opposed him, and with one blow of his club broke a high mountain from summit to base.

No. 1 XX) is the Strongest Explosive Known.

No. 2 is superior to any powder of that grade.

PATENTED IN THE UNITED STATES PATENT OFFICE.

ORDERS RECEIVED FOR HERCULES CAPS AND FUSE.

MINING MACHINERY A SPECIALTY.

Our manufactures of mining machinery embrace every kind of machine and appliance for the mining and reduction of ores.

We have had an experience of more than twenty years in the manufacture and practical operation of mining machinery in Colorado and the neighboring States and Territories.

Our facilities are superior to those of any manufactory in the West, our works having been recently rebuilt, greatly enlarged and completely equipped.

We invite the investigation of mine owners and mill men seeking machinery. We can furnish, on board, at our works, or set up at the mines anywhere in the Rocky Mountain region, on short notice, the following machinery: Cornish Pumps, Steam Pumps, Stamp Mills for Wet or Dry crushing, Pans, Settlers, Agitators, Retorts, Bullion and Ingot Moulds, Reverberatory Furnaces, Bruckner Cylinders, Revolving Roasting Furnaces and Dryers, Melting Furnaces, Concentrating Machinery, Rolls, Crushers, Conveyors and Elevators, Ore Samplers and Grinders, Hoisting Engines, Water Jacket Furnaces, Slag Pots and Cars, Lead Pots and Ladles, Blast Pipes and Water Tuyeres, Blowers, Cupellation Furnaces, Market Kettles, Wire Rope, Cages, Buckets, Skips, Ore Cars, etc. Estimates furnished and prices quoted on application. Send for illustrated catalogue.

We would call the attention of Assayers, Chemists, Mining Companies, Milling Companies, Prospectors, etc., to our full stock of Balances, Furnaces, Muffles, Crucibles, Scorifiers, etc., including, also, a full stock of Chemicals.
Having been engaged in furnishing these supplies since the first discovery of mines on the Pacific Coast, we feel confident from our experience we can well suit the demand for these goods both as to quality and price. Our *New Illustrated Catalogue*, with prices, will be sent on application.
Our Gold and Silver Tables, showing the value per ounce Troy at different degrees of fineness, and valuable tables for computation of assays in grains and grammes, will be sent free upon application. Agents for the Patent Plumbago Crucible Co., Loudon, England.

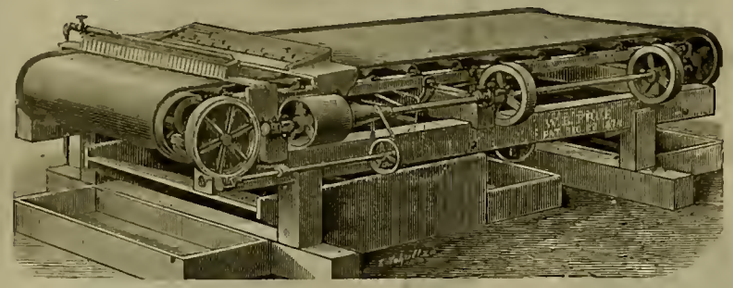
Iron Cut, Punched, and Formed for making Pipe on ground, where required. All kinds of Tools supplied for making Pipes. Estimates given when required. Are prepared for coating all size of Pipes with a composition of Coal Tar and Asphaltum.
Office and Manufactory, 130 Beale Street, San Francisco.
SHEET IRON PIPE. SHEET IRON PIPE.

$1,000 CHALLENGE!


THE FRUE ORE CONCENTRATOR.
Nearly 300 are now in use, giving entire satisfaction. Awarded First Premium and Silver Medal at the Industrial Fair for 1880 of the Mechanics' Institute of San Francisco, Cal.
Saves from 50 to 100 per cent. more than any other Concentrator in use, and concentration is clean from the first working. The wear and tear are merely nominal; water required is less than in any other wet Concentrator; the power required per machine is less than one-half horse power; the labor required is light, one man on a watch can attend to sixteen machines.
We challenge any other Concentrator in use for a fair and impartial competitive trial, side by side, for stakes of $1,000 each, and we mean business.
A machine with all improvements can be seen in working order and ready to make tests, at the office of Hinckley, Spiers & Hayes, 220 Fremont street.
ADAMS & CARTER, Agents, Room 7 No. 109 California Street, S. F.

MOREY & SPERRY,
MANUFACTURERS OF
Gold and Silver Grinding and Amalgamating Machinery

HOWLAND'S PULVERIZER Takes the Place of the Cumbersome Stamp Mill and can be put up in one day ready for work.
IT HAS BEEN FULLY PROVED AND TESTED.
It weighs complete, 7,000 pounds. It costs $1,500 ready for the belt. Will crush one ton per hour of hard quartz that will pass through a 40-mesh screen. The wear is less than in the stamp mill. Its wearing parts are plain castings and can be dropped into position in a few moments, as shown by the letters A, B and C, no bolts or keys are required; it can be set upon the floor of a mill with no expense for foundations, and can be used to crush and work in charges or continuous. It will amalgamate either gold or silver ores, making a simple, cheap and effective mill, it requires twelve-horse power.

Stamp Mills, Rock Breakers, Crushing Rolls, Amalgamating Pans and Separators for Gold and Silver ores Chloridizing Furnaces, Retorts, Rock Drills Air Compressors, Steel Shoes and Dies for Stamps, and every description of Mine and Mill Supplies Iron Work complete for Wood Frames, also
SPERRY'S WROUGHT IRON FRAME FOR STAMP MILLS.
Great saving in time and money over the Wood Frame. It is made complete with Wrought Iron Frame ready to put upon the foundation. We construct Mills with Stamps weighing from 350 to 900 pounds for Gold and Silver Ores. Wet or Dry Crushing Mortars.
MOREY & SPERRY—Warerooms, 92 and 94 Liberty St., N. Y.

Mining and Other Companies.

Persone interested in incorporatione will do well to recommend the publication of the official notices of their companies in this paper, as the cheapest appropriate medium for advertising.

Seaton Gold Mining Company—Location

of Principal place of busiuess, San Francisco, California. Location of works, Drytown, Amador county, California. NOTICE.—There are delinquent upon the following described stock, on account of Assessment No. 1, levied June 6, 1882, the several amounts set opposite the names of the respective shareholders, as follows:

Name.	No. of Certificate.	No. of Shares.	Amount.
Martin, A (Trustee)	9	5,000	balance, $350.00

And in accordance with law, and an order of the Board of Directors, made on the 6th day of June, 1882, so many shares of each parcel of such stock as may be necessary will be sold at public auction, at 523 California St., Room 6, San Francisco, Cal., on Wednesday, August 16th, 1882, at the hour of 4 o'clock P. M., of said day, to pay said delinquent assessment thereon, together with cost of advertising and expense of sale. A. MARTIN, Sec'y.
OFFICE—Room 6, 523 California St., San Francisco, California.

POSTPONEMENT.

The day of sale of the above-named delinquent stock is hereby postponed to THURSDAY, the fourteenth (14th) day of September, 1882, at the same hour and place. By order of the Board of Directors. A. MARTIN, Sec'y.

ASSESSMENT NOTICE.

Gould & Curry Silver Mining Company.

ASSESSMENT, NO. 43.

Levied.....August 24
Delinquent.....September 30
Day of Sale.....October 21
Amount per Share.....Fifty Cents

Office—Room 60, Nevada Block, 300 Montgomery St.

Bullion Silver Mining Company.—Loca-

tion of principal place of business, San Francisco, California; location of works, Gold Hill Mining District, Storey County, Nevada.

Notice is hereby given that, at a meeting of the Board of Directors, held on the first day of August, 1882, an assessment (No. 25) of Fifty (50c) Cents per share was levied upon the capital stock of the corporation, payable immediately, in United States gold coin, to the Secretary, at the office of the Company, Room 3, No. 328 Montgomery street, San Francisco, Cal.

Any stock upon which this assessment shall remain unpaid on the fifth day of September, 1882, will be delinquent, and advertised for sale at public auction; and, unless payment is made before, will be sold on WEDNESDAY, the 27th day of September, 1882, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Directors.

J. M. BRAZELL, Sec'y.

OFFICE—Room 3, No. 328 Montgomery street, San Francisco, California.

And in accordance with law, and an order of the Board of Directors, made on the sixth day of July, 1882, so many shares of each parcel of such stock as may be necessary will be sold at public auction, at the office of the Company, Room No. 3, 220 Sansome St., San Francisco, Cal., on Monday, the fourth day of September, 1882, at 12 o'clock M. of said day, to pay delinquent assessment thereon, together with cost of advertising and expenses of sale. WINSLOW ANDERSON, Sec'y.

OFFICE—Room No. 3, 220 Sansome St., San Francisco, California.

"THE $1,000 CHALLENGE"

Ore Feeder for Quartz Mills.

OVER 800 ARE NOW IN USE, GIVING ENTIRE SATISFACTION.

Awarded First Premium at the Tenth and Twelfth Industrial Fairs of the Mechanics' Institute.

Twenty Per Cent. More Ore Crushed with Fifteen Per Cent. Less Wear of Iron than by Hand Feeding.

The accompanying cut illustrates the recently introduced Grip, and also the Spring Attachment, which replaces the Weight heretofore used, and which are obvious improvements.

It is now fully demonstrated, after careful and long continued experimentation and practical use, that the plan upon which a perfect Ore Feeder must be constructed is that of a carrier, and not that of a shaking table. Uniform and accurate feeding is not possible upon the latter plan. The ore must be evenly carried, upon a steadily advancing plane or table, to the line of discharge, and there simply dropped. Jerky or spasmodic contrivances will not answer the purpose for wet or sticky ores.

The Challenge Ore Feeders are now in Use in the following Mills, besides many others

Superiority of the "Challenge" Ore Feeder Demonstrated!

At the "Christy" Mill, Uintah County, Utah, the "Eclipse" Feeders, (conceived by E. Coleman) were introduced, but not carrying a regular supply of ore for the crushing capacity of the stamps, were replaced by the "Challenge," which are now running and the stamps crushing forty (40) per cent. more ore than was done by the "Eclipse."

The "Harshaw" or "Hermosa" Mill, of Patagonia District, Arizona, was also originally fitted with "Eclipse" Feeders, but after a few weeks trial they were pronounced inadequate to the work, discarded, and the "Challenge" adopted.

The "Silver King" Mill of Arizona, also removed the "Eclipse" Feeders to give place to the "Challenge."

The "Sola" Mill of Brown's Valley, Yuba County, Cal., was fitted with "Victor" Feeders, manufactured by E. T. Steen, but proving insufficient, the "Challenge" Feeders were substituted.

Four of the "Victor" Feeders, manufactured by E. T. Steen, were also placed in the "Alexander" Mill, at Grantsville, Nevada, but after a fair trial were discarded, and Hendy's Feeders fitted, and four others of the same pattern added when the second twenty stamps were erected.

These cases are simply cited from among many similar instances, in proof of the vast superiority of the "Challenge" Feeders over all others.

JOSHUA HENDY, Agent,

Machine Works 49 and 51 Fremont Street, San Francisco.

Manufacturer of Quartz, Saw Mill and General Machinery. Also Agent for BAKER ROTARY PRESSURE BLOWERS, and WILBRAHAM ROTARY PISTON PUMPS. P. BLAISDELL & CO.'S Machinists' Tools. HOT POLISHED SHAFTING from the Akron Iron Company, of Akron, Ohio.

Dealer in New and Second Hand Engines, Boilers, and all Descriptions of Machinery.

GIANT POWDER.

MANUFACTURED UNDER ALFRED NOBEL'S ORIGINAL AND ONLY VALID PATENT FOR NITRO-GLYCERINE POWDERS

All Nitro-Glycerine Compounds, for instance, so-called HERCULES, VULCAN, VIGORIT, NITRO-SAFETY Powder, Etc., are infringements on the Giant Powder Co.'s Patents.

THE GIANT POWDER COMPANY

Call Special Attention to their Improved Grades of Powder.

NO. 1.—The most Powerful Explosive Compound now in use here.
NO. 2.—Surpasses in strength any Powder of its class ever manufactured.
NO. 3. This grade is a Strong and Reliable Powder, which does excellent work.

JUDSON POWDER

is now used in all large Hydraulic Claims, and on most Railroads. It breaks much more ground, and obviates reblasting by breaking much finer. TRIPLE FORCE CAPS AND ALL GRADES OF FUSE.

☞The Giant Powder Company have also purchased from Mr Nobel, the inventor of Nitro-Glycerine, his latest invention, known under the name of **Nobel's Explosive Gelatine.** This explosive is from 50% to 60% stronger than the strongest Nitro Glycerine Compound and impervious to water. Even hot water does not diminish its strength. We are now introducing the same

BANDMANN, NILSEN & CO., General Agents, 210 Front St., S. F.

Contains no Nitro-Glycerine or Chlorate of Potash, and is the only High Explosive Manufactured in America that does not contain these Dangerous Ingredients.

In Use for Seven Years Without a Single Accident.

VIGORIT POWDER.

NO ACCIDENT HAS EVER HAPPENED.

ALL POWDERS manufactured by the California Vigorit Powder Co. are SUBMITTED during the course of manufacture TO SCIENTIFIC and accurate TESTS for safety and strength.

They are tested for Safety against Friction, Fire, a Temperature of 212° Fahr., and the various shocks to which Powder is liable in practical handling.

The following qualities are common to all grades of Powder manufactured hy the Company:

Safety, Non-Leakage; Freedom from Noxious Gases; Uniformity and Strength.

If consumers desire it, the EXACT STRENGTH of any Powder shipped to them will be GIVEN IN FOOT POUNDS.
☞Send for Pamphlet showing methods of testing the different qualities of all Powders.
The Company manufactures:

DETONITE.

This is an explosive involving new principles and recently patented. It is the **Strongest Powder ever placed on the Market,** in this country or abroad. It is the **Safest Strong Powder ever made.** For very refractory rock this Powder is the most economical in the market.

VIGORIT, No. 1, XX.

This Powder is **Stronger than the Highest Grades of Hercules or Giant.** It is only surpassed by "Detonite." t is suitable for hard rock.

VIGORIT, No. 1.

For general work this Powder has no superior. It has the advantage over Giant, Hercules or Vulcan in safety and freedom from noxious fumes.

VIGORIT, No. 2.

Equal to any corresponding Grade in the Market.

LOW POWDER.

VIGORIT, L. P.

This is a Powder suitable for **Bank Blasting, Log Splitting** or the work generally in which Black Powder can be used. It is STRONGER THAN BLACK POWDER, having from twice to ten times the effective strength, depending on resistance. It is **Superior to Judson Powder,** in being more sensitive to the cap and more convenient in handling.

Best Qualities of FUSE and CAPS sold at Lowest Rates.

CALIFORNIA VIGORIT POWDER CO., **ENGLISH & WRIGHT, Agents**

No 327 Pine St., San Francisco.

MINING AND SCIENTIFIC PRESS.

An Illustrated Journal of Mining, Popular Science and General News.

BY DEWEY & CO., Publishers. SAN FRANCISCO, SATURDAY, SEPTEMBER 2, 1882. VOLUME XLV Number 10

A New Water Pressure Gauge.

[Written for the PRESS by ROSS E. BROWNE, University of California.]

A want has long been felt for a water pressure gauge that is simple and accurate. Feeling this want, Prof. Hosse, of the University of California, has utilized a principle for measurement of head, in conducting some of his experiments, which proves so convenient that I concluded, with his consent, to try and adapt it to general use. The gauge, as now described in the application for patent, is shown in the annexed diagram.

B is a glass bottle. *O*, small opening connected by means of a rubber supply tube, *S*, with the head to be measured. O_1, larger opening through which water discharges into waste tube, *W*. *R*, rubber stopper through which passes the open glass tube, *T*. *G* and G_1, graduations showing the head in feet and pressure in pounds to the square inch respectively. *C*, a cock by means of which the pressure is turned on and off. The action is as follows:

Let *H* designate the head to be measured; *h*, the head in bottle, *B*; *a*, the area of opening, *O*; a_1, the area of opening, O_1; *u*, the co-efficient of efflux through *O*; u_1, the co-efficient of efflux through O_1; and since all the water which enters through *O* escapes through O_1, we have:

$$a u \sqrt{2g(H-h)} = a_1 u_1 \sqrt{2g h}$$

Hence, $$\frac{H}{h} = 1 + \left(\frac{a_1}{a}\right)^2 \left(\frac{u_1}{u}\right)^2 \quad \ldots\ldots (1)$$

The water stands at the head, *h*, in tube, *T*, and we see from equation (1), that by altering the ratio of the openings, *O* and O_1, we have it in our power to make this head (*h*) in the bottle any desired fraction of the head (*H*) to be measured. One of the gauges has been made for accurate experiment, having tube, *T*, 6 ft. long, and with it a head of 150 ft. can be measured accurately to within one inch.

Where no great accuracy is sought, the divisions of the scale may be made equal throughout. If extreme accuracy is aimed at, it is apparent that the graduation will not be precisely uniform, owing to the fact that the ratio $\left(\frac{u_1}{u}\right)$ is not a constant under varying heads. The effect of this is small, and does not prevent us from making the graduation as accurate as desired, as will be seen later on.

Several gauges were made of metal before this form in glass was settled upon. Equation (1) shows that *h* varies with the square of the ratio of the areas of *O* and O_1, or with the fourth power of diameters, and is therefore extremely sensitive to any alteration of these openings by corrosion or wear. For this reason openings in metal are mostly unsafe—Gutta Percha is perhaps safer—but openings in fused glass are doubtlessly the best.

Examining the gauge critically several objections arise:

1. The small opening, *O*, is subject to scratching and wear. A careful test of the importance of this remains to be made, but such a gauge has been in frequent use for two months under head of from 30 to 120 feet, and has not been observed to lose in accuracy; however my present means of testing are not good enough to make this statement a reliable guide.

2. The openings may be clogged by sediment if the water is muddy. Fortunately the discharge opening, O_1, is so large as compared with the supply opening, *O*, that no sediment would be likely to enter which could affect O_1. *O* is so placed that the rubber supply tube may be quickly removed and the sediment brushed away. Besides opening, *O*, is so small (scarcely larger than the point of a pin) that the velocity in the tube, *S*, is too little to cause the carrying of much sediment, and even this might be mainly screened if necessary.

3. A certain quantity of water is wasted.

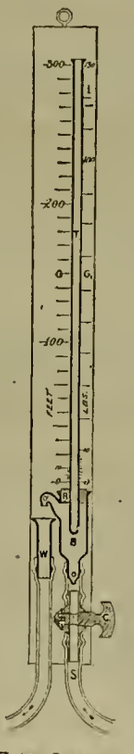
Numerous means of reducing this waste have been considered, of which only one, offered by Prof. Hesse, seems practical. In the first place, it will be seen that *h* is so small, as compared with *H*, that no appreciable effect can result from altering the scale by decreasing *O*. Of course, by diminishing *O*, we diminish the waste in the same proportion; but I am inclined to think, after making several trials, that it would not be well to make *O* much less than .015 of an inch: and in this case, the waste amounts to about three gallons per hour, under 100 ft. head.

The means above referred to is by placing at intervals in the supply tube, instead of one opening *O*, a number (*n*) of such openings. Leaving out the consideration of *u* and u_1, it is easy to show that:

$$\frac{H}{h} = 1 + n\left(\frac{a_1}{a}\right)^2 \quad \ldots\ldots (2)$$

If, now, we make $n = 4$, the waste is reduced by one-half. Even here the result scarcely seems to justify the means used. The cock, *C*, is provided, in order that the head may be quickly turned on and off, and the waste be thus made inappreciable.

4. It is apparent that there will be some difficulty in making the size and shape of the openings precisely the same in a number of gauges, so that in manufacturing a uniform



A New Water Pressure Gauge.

scale will answer. This may be overcome by drilling and reaming the discharge opening under a known head until the proper ratio is effected, or the same thing may be accomplished by placing an adjustable obstruction behind the discharge opening. So far, each scale has been made separately, two points being marked under heads measured with a standard gauge. In the case above mentioned, where extreme accuracy is desired, 4 or 5 points may be marked under measured heads and the intervals separately graduated.

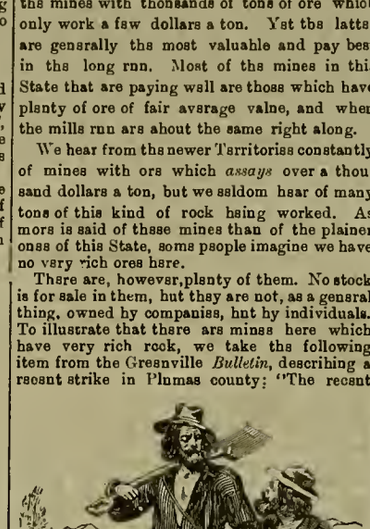
This gauge has many qualities that will recommend it, not only to the careful experimenter and hydraulic engineer, but to anyone who wants a ready means of measuring heads of water. It is exceedingly sensitive and accurate, and is easily adjusted to any desired scale by simply altering the size of the discharge opening, so that a small fraction of a foot may be measured under high heads. It is simply made, and a gauge the size of an ordinary thermometer, say one foot long, may be graduated to mark single feet (less than ½ lb.) with a range of say 200 ft. Where the small waste is objected to, and the less accurate steam gauge is preferred, it will make an excellent check-gauge.

Rich California Mines.

We hear a good deal in the public prints of mines with a few inches of ore which run up into the thousands per ton, but not much of the mines with thousands of tons of ore which only work a few dollars a ton. Yet the latter are generally the most valuable and pay best in the long run. Most of the mines in this State that are paying well are those which have plenty of ore of fair average value, and when the mills run are about the same right along.

We hear from the newer Territories constantly of mines with ore which *assays* over a thousand dollars a ton, but we seldom hear of many tons of this kind of rock being worked. As more is said of these mines than of the plainer ones of this State, some people imagine we have no very rich ores here.

There are, however, plenty of them. No stock is for sale in them, but they are not, as a general thing, owned by companies, but by individuals. To illustrate that there are mines here which have very rich rock, we take the following item from the Gresnville *Bulletin*, describing a recent strike in Plumas county: "The recent



"On a Prospect."

strike at Eagle gulch is something so great that a bare statement of the facts would read like the wildest romance. One of the owners of the mine, with a hammer and chisel, cut out one solid lump of gold worth $2,700. When the ledge was struck in the lower tunnel, a man who was at work there was sent off some little distance; during his absence his employer took out $10,000. Much of the rock is not crushed at the mine, but is shipped direct to San Francisco. It is a common thing to find from $200 to $300 worth of gold in a single pan of dirt. The ledge is nearly 50 ft. wide, all of which is good milling ore; the extremely rich vein is about three feet wide. The upper and lower tunnels are 70 ft. apart; the ore in both is of the same quality. There is no reason for doubting that all the space between these two will yield like what has already been opened. Should this prove to be true, a large fortune will be the result. This mine at Eagle gulch is to-day the greatest in the State. To illustrate how fortunes are missed and made in mining, it may be stated that a short time ago a mine operator of great experience went and examined the property; it was offered to him for $75,000 and he refused it. Not long afterward that much could be taken out in little more than a week."

THERE is not a mining town in the State of Colorado but what has a certain part of its population lying idle, waiting for something to "turn up," instead of rustling around and turning that something up themselves.

THE first six months of 1882, dividends paid by mining companies amounted to $7,212,344; for like period of 1881, $6,843,510, or $370,094 in favor of 1882.

National Industrial Convention.

It is proposed to hold a convention of the leading industries of the United States, in Denver, on the 12th and 13th days of this month, to embrace representatives of the manufacturing, commercial, mining and agricultural interests of the whole country.

First session will be called in the Tabor Grand Opera House, at 10 A. M., Tuesday, September 12th. The following general topics are among those called up for discussion:

1. The monetary question—Is it for the interest of the United States to have silver demonetized?

2. The immigration question—Is increased immigration desirable? Is it good policy to restrict Chinese immigration?

3. The labor question—Are strikes and trades unions a curse or a blessing to the laboring classes?

4. The tariff question—Is protection necessary to the growth of American industries?

Any information regarding the convention can be ascertained by addressing Judge John J. Henry, Chairman, Hamilton S. Wicks, Secretary, or N. B. McCrary, President of the Denver Board of Trade.

The following organizations are among those which will send delegates.

The American Iron and Steel Association; the New York and Pennsylvania salt manufacturers; the iron ore producers; the coal producers; the silver and gold producers; the National Association of Wool Manufacturers; the Silk Association of America; the United States Potters' Association; the Arkwright Club of Cotton Manufacturers; the Philadelphia Association of Manufacturers of Textile Fabrics; the Manufacturing Chemists' Association of the United States; the Glass Manufacturers' Association of the United States; the Northwestern Lumber Manufacturing Association; the American Paper Makers' Association; the Millers' National Association; the Textile Manufacturers' Association of the West and South; the Type Founders' Association of the United States and the Book Trade Association of Philadelphia; the New England Shoe and Leather Association; the Amalgamated Association of Iron and Steel Workers; the shipbuilders of the United States; the producers of sugar, cotton and tobacco; the producers of jute, flax, hemp and sugar beets; other farmers and planters; the National Wool Growers' Association; the manufacturers of copper and brass; the corset manufacturers; the Hosiery Manufacturers' Association; the builders of American cotton machinery; the manufacturers of Morocco leather; the New York Wool Growers and Sheep Breeders' Association; the Wisconsin Sheep Breeders' and Wool Growers' Association; the Northern Illinois Sheep Breeders and Wool Growers' Association; the Vermont Merino Sheep Breeders' Association; the Michigan Sheep Breeders and Wool Growers' Association; the Michigan Merino Sheep Breeders' Association.

The California Commissioner to the Denver exposition has been asked to bring a delegation of merchants and manufacturers from this State. The low fares now in force on the roads to induce travel to the mining exposition renders a trip to Denver very desirable at this time. Delegates to the Industrial Convention will receive special consideration from the Board of Trade, which will be no small item in their expense account.

The Prospectors.

The little sketch on this page will be recognized by all familiar with the subject as a truthful one. The prospectors are debating whether to start in on a particular spot or not. One wants to, another is opposed to it, and a third is listening to the arguments *pro* and *con*, ready to throw the weight of his opinion either way. And this is always a momentous question. Shall we start in here, or not? In a "blind ledge" country a great deal of judgment has to be exercised as to where to "run a cut." Where croppings are plentiful, the choice of location is easier. It is in these things that the prospector must determine quickly questions that decide his future. He may throw away many days or weeks work on a poor spot, or may "strike it" with a few blows of the pick

Forest Trees of California.*

The Great Washington Cedar—(Sequoia Gigantea)†

"If I will that he tarry till I come, what is that to thee."
—*New Testament.*

We cannot give a full history of this wonderful tree here; so we chiefly collate from Mr. J. Muir, who has best said, substantially: "The great sequoian timber belt lies along the Sierras upon the first exposed mountain side"—moraines of recent retiring glaciers—that face the Pacific, from Calaveras on the north to near the head of Deer creek on the south—a distance of 200 miles, or little above 38° north to a little below 36°; altitude, 5,000 to 8,000 ft., rarely 8,400 ft.; broken by two gaps, each 40 miles wide, caused by manifest topographical and glacial reasons given; one gap between Calaveras and Tuolumne, the other between Fresno and King's river; thence the vast forest trends south, across the broad basins of Kaweah and Tule, a distance of 70 miles, on fresh moraine soil, ground from high mountain flanks by glaciers. The inscriptions (which we have often examined with Mr. J. Muir), are scarce at all marred by post-glacial agents, and the contiguous water-worn marks are often so slight in the rock-bound streams as to be measured by a few inches. Rarely does one of these sound and vigorous cedars fall, and if so, lie 800 to 1,000 years, scarcely less perishable than the granite on which it grew. The great sequoian ditches, dug at a blow by their fall, and the tree tumuli, always turned up beside the deep root-bowls, remain, *but not a vestige of one outside the present forests has yet presented itself*, hence the area has not been diminished during the last 8,000 or 10,000 years, and probably not at all in post-glacial times. The notion, therefore, that this species tends toward extinction more than other, or the planet itself, seems absurd, for its vital vigor is assured in ages past and present, and, so far as mundane things can be, to come. These colossally sublime sequoiae rise 275, 300, and even 400 ft. aloft; are 20 to 30, and in some rare cases, 40 ft. in diameter, like vast columnar pillars of the skies. No known trees of the world compare with them and their kin, the redwoods, for the focused proximity of such a marvelous amount of timber within limited areas—as it were, the *ne plus ultra* standard of timber-land capacity. Nor is language alone adequate to impress upon us any due realizing sense of such vast tree magnitude without comparative and associated statements, as if this were the all-important idea—and truly the utilitarian is a good foundation—indeed, enormous factor of some import; thus, the stage-coach passes through one; 120 children and a piano crowd inside another; house for cotillion parties to dance "stout on stumps;" horse and rider travel afar within burnt-out hollows of others, and so on, with variations. A single tree would furnish two-rail fencing 20 to 30 miles, etc.

Having often visited these groves, a word may be allowed relative to their sylvan claims, apart from lumber and cord-wood contemplations. Familiar as we all are with their ready growth into sturdy, conic, juvenile trees, with exceedingly broad swoop of base, we pass to those of columnarly towering and spiry-topped youth of a few hundred years or so; then, at length, we behold, face to face, the Great Washington cedar in its prime, to the grand and picturesque with the ages. To our view, their expression is one of softened and more lovely beauty with advancing years. Vastness harmoniously merges into dignity and elegance, even in the most picturesque, with here and there huge arms thrust out towards the horizon round about. They never exhibit the wayward vagrancy of many other trees, but so soon as they approach the appropriate outline of towering symmetry, swoop upward in one grand triumphant air of sublime attitude, their bright end burning arms aloft, appealing to Jove's high throne in the heavens. The lesser and more massed branches accumulate above in ever-refreshing variety, inspiring the upper body and crowning the venerable domed head and massive brow in a halo of softer, serener glory. Fragments of special foliage in rounded or varied tufts and touches, tiny buttoned bouquets of beauty, as it were, pinned on gracefully here and there for effect, to foil Herculean brawn—so in least as in largest, to fill and soothe the sense; the tiny, tender, slender and delicate little sprigs e'en hiding the finishing hand that gives the final touch of the Great Artist—forcible reminder of the light, gauzy texture lines of the finest figures of our earth-born artists; but these drawn by hallowed hands on the celestial canvas—pictures of inimitable grace and beauty graven on the blue tablet of the skies. But what should be said of that great behemoth-like hide of bright cinnamon-brown bark, in massive mantle folds one to two feet thick, of lightly compacted shreddy fibers, darker on the shady side, or in youth and early prime tinted in royal purple, nay, crimson-fired in the lingering smiles of the western sun's adieu. Then behold it flowing into large deep water-line troughs, as it were, careering silently on a smooth bed adown the mountain hight, until broadening and free they serenely glide into their great earthy sea.

The hue of young trees becomes of somewhat soft invisible sea-green or delicate bloomy tint, but when the venerable foliage ripens into its golden age of glory, it becomes yellowish-green. From noting the foliage in a general way, if more closely inspected, the leaves are awl-pointed and boat-keeled on the back, lapping one over the other in a scale-like way, loosely, as it were, alternating or spirally in four rows, and so passing round the ultimate sprays. Flowers on the tips of twigs, tiny pollen ones globoid. When cone-bearing forests are in bloom, the gentle rolling breezes waft the golden or yellow-folded clouds of pollen everywhere among the trees, or in this genus and fir, lighter or spirited aloft, the pollen clouds drift along high up over common tree-tops; nor have fir any fruit save on their tips. This sulphur-like dust is often carried by storms afar, and, precipitated by rains, marking margins of pools, foot-prints, and ruts of roads. Cones, egg-form, two by one and one half inches, thick-shield scales, diamond-disked or obliquely trapezoidal, roughly puckered, the radiating wrinkles indrawn by the quilted center point, latterly transverse-ridged, the concealed part broadly wedge-shaped, strongly persisting; seeds, three to five to each scale, slightly oblong or subrhombic circuloid, being obliquely wing-margined; the middle body part narrowly wedge-like, often very short, pointed in the slightly notched end, which is apt to remind one of parsnip seed or the like.

Finally, in all due homage, do we accord to this great first-born of the forest, not only priority in time, but in degree of goodness as to quality, pre-eminence at nearly all points of view, and as to state—past, present and to come—whether as to use, magnitude, dignity, elegance or beauty, yielding the palm of our forests to sequoias, for they are indeed the great St. John cedars that never grow old, are never decayed, or ever diseased, and forever rallying in youthful vigor to repair their storm-lost crowns; never known to die a natural death—sylvan types of the immortals.

* From "The Forest Trees of California," by A. Kellogg; published by the State Mining Bureau. State Printing Office, Sacramento, 1882.

† As historic truth demands it, it is but just to say, I, myself, took Mr. Lobb to the California Academy of Sciences, and showed him the first specimens he ever saw of this marvelous, now world-renowned, Washington cedar, which was so named by me before he ever saw the tree. This fact is well known to the old charter members of the Academy, several of whom are still living. It is, therefore, the earliest among common names, and claims precedence, by all courtesy, in point of time, as also in appropriateness of honor. Our relations to its earliest identification we leave to the historian of the future.

Proposed Line of Steel Steamers.

The danger of complete monopolization of existing lines of transportation from this coast to the East and Europe is leading to renewed discussion of the establishment of lines of steamers owned and built in California. At the last meeting of the Board of Trade, C. T. Hopkins described the advantages of having a line of steamers, owned in San Francisco, to trade with the Atlantic and European ports. He pointed out that San Francisco merchants were threatened with a loss of trade in the North by the completion of the Northern Pacific. A gentleman engaged in the business of building steel and iron steamers, a member of a firm having £1,000,000 capital, has recently been on this coast examining our iron ore, and he has gone away with the impression that he could manufacture steel here and work that steel into ships and machinery as cheaply as he could do it in England. He had also been informed by a man whose word is beyond question, a capitalist who intends to take an interest in this venture, that if there is any encouragement to come here with a force of 200 men, with all the money and machinery necessary to go to work to start the construction of steel steamers on this coast, they will come here and do it. In view of these circumstances, he thought it would be wise to appoint an active committee to ascertain whether proper encouragement could be given. Could sufficient capital be raised here to induce such a venture to become established, and manufacture steamers that can carry goods from New York to this coast and deliver them in 60 days, giving the advantages of competing with the railroads? Could enough money be obtained from loyal, faithful men to put this enterprise on its feet? He thought it could be done. On exports alone we pay $16,000,000 per annum for freights, and nobody, so far, seems to think much about it. To carry out the suggestion, he offered the following, which was approved:

Resolved, That a committee of five be appointed by the chair to consider the feasibility of the construction of a line of large steel propellers, to be owned in San Francisco and employed in a direct trade between this city, Liverpool and New York, via the straits of Magellan and Panama or Nicaragua; also, to correspond with iron ship and steamer builders in the United States and Great Britain, with a view to the establishment of their industry on this coast.

Capt. Merry and Mr. Williams also spoke in favor of the establishment of a line of steamers to ply between here and New York and Europe. It must be acknowledged that the realization of some such projects is of vital importance to the producing interests of the Pacific coast.

A NEW EXPLOSIVE is reported to have been invented by a Viennese engineer. It contains neither sulphuric acid, nitric acid nor nitro-glycerine. Its manufacture is simple and without danger, and it preserves its qualities in the coldest or hottest weather. It can be manufactured at 40 % less cost than gunpowder.

THE brilliant light of the electric arc is found to be much less dangerous to the eyes than was for some time believed. So high a medical authority as the London *Lancet* reports that the dazzling light has come under its notice, and in that instance the exposure was unusually severe and prolonged.

GOLDEN GATE FAIR.

Speed Programme for 1882.

$10,000 IN STAKES AND PRIZES.

FIRST DAY—Monday, Sept. 4.

No. 1—RUNNING—GOLDEN GATE STAKE—For all two-year-olds; three-quarter mile dash; $50 entrance; $15 forfeit; $150 added; second colt to save stake; winners five pounds extra.

No. 1. Leland Stanford, Palo Alto, names ch f Satanella, by Leveler, dam Fron-Fron, by Asteroid. No. 2. Leland Stanford, Palo Alto, names ch f Satinet, by Wildidle, dam Rose by Cheatham. No. 3. C. NO. 4—SAME DAY—TROTTING—2:40 class; purse, $600; first horse, $360; second, $180; third, $60.

No. 1. Peter Coutts, Mayfield, names Manon (5), by Nutwood, dam Addie. No. 2. H. B. Cooper, Alameda, names ch g Frank Mosco (9), by Frank Mosco, dam old Lady Frank Ilin. No. 3. Entered by Mart Rollins for James McCord, San Francisco, b g Freestone, by Capt. Webster, dam an Owen Dale mare. No. 4. G. Bernard, San Francisco, names gr g Allen Roy, unknown. No. 5. W. Z. Price, San Mateo, names b m San Mateo Belle, by Speculation, dam Young Lady Vernon. No. 6. B. F. Miller, San Rafael, names b s Marin, by George M. Patchen, Jr., dam unknown. No. 7. P. Farrell, San Francisco, names b h Vanderlynn, by George M. Patchen, dam a Josephb mare. No. 8. James Garland, San Francisco, names gr g Rowdy Boy, by Rustic, dam by Belmont. No. 9. Louis Duncan, Santa Clara, names b g Louis D. No. 10. W. H. Henderson, San Jose, names m Big Lize. No. 11. L. H. Titus names b s Exile, by Echo, dam ——. No. 12 John McIntyre, Sacramento, names ch g Edwin For est, by Blackbird, dam unknown. Owned by E. F. Smith.

NO. 5—SAME DAY—SPECIAL TROT AGAINST TIME—$150 in plate will be awarded any stallion that beats Santa Claus' time (2.17½).

SECOND DAY—Tuesday, Sept. 5.

No. 6. TROTTING—2:30 class; purse, $800; first horse, $480; second, $240; third, $80.

No. 1. W. D. Hammond, East Oakland, names gr s Poscora, by Billy Hayward, dam Lady Poscora. No. 2. Wm. Bihler, entered by Steve Crandall, Santa Rosa, b m Blanche, by Gray McClelland, dam by John Neilson. No. 3. John A. Goldsmith, Oakland, names b m Sweetness, by Volunteer, dam by Edward Everett. No. 4. J. & W. S. Futsch, entered by S. Sperry, Petaluma, ch m Nellie R., by Gen McClellan, Jr., dam Susie Rose. No. 5. A. Waldstein, San Francisco, names b s Albert W., by Electioneer, dam by John Nelson.

NO. 7—SAME DAY—PACING—Purse, $500; first horse, $300; second, $150; third, $50.

Washington and Johnny Wiegle, to wagon.

No. 1. L. E. Yates, Oakland, names b m Corette, by Winthrop, by Old Drew, dam Cora by Lady's Kentucky Hunter, by Kentucky Hunter. No. 2. E. S. Denison, Oakland, names ch m Lady Hays, by Hiram Tracy, dam a Nelson mare. No. 3. A. L. Hinds, Oakland, names ch s Oakland Boy, by Winthrop, dam by Simpson's Blackbird. No. 4. C. Valensin, Arno station, Sacramento county, names br m Onida, by Black Hawk, dam by Fanny King. (Closed by agreement.)

THIRD DAY—Wednesday, Sept. 6.

NO. 3—RUNNING.—Free for all; two-mile dash; $100 entrance; $25 forfeit; $250 added; second horse to save stake.

No. 1. P. J. Shafter, San Francisco, names b c Night Hawk (5), by imp. Haddington, dam by Norfolk. No. 2. Leland Stanford, Palo Alto, names b f Precious, by Lever, dam Frolic, by Thunder. No. 3. Wm. Boots, Milpitas, names b m Mollie H. (5), by Wildidle, dam Mamie Hall by Norfolk. No. 4. J. T. Gilmer, Salt Lake, names b h Red Boy (aged), by Wardance, dam imp. Nelson. No. 5. Stemler & Ayers, Portland, Or., names ch g Fred Collier, by Joe Hooker, dam Puss by Norfolk.

NO. 9—SAME DAY—TROTTING—Free for all three-year-olds; purse, $600; first horse $360; second, $180; third, $60.

No. 1. J. C. Simpson, Oakland, names b c Anteo, by Electioneer, dam Columbia by A. W. Richmond, g d Columbine by Bonnie Scotland. No. 2. James M. Learned, Stockton, names Adrian, by Rellance, dam by Kentucky Hunter. No. 3. Irving Ayers names blk s Fred Arnold, by Nephew, dam Fannie Fern, mother of Mollie Drew. No. 4. Filly, by Admiral. (Closed by agreement.)

NO. 10—SAME DAY—TROTTING—2:22 class; Purse, $300; first horse, $180; second, $240; third, $80.

No. 1. J. B. McDonald, Marysville, names b s Brigadier, by Happy Medium, dam Lady Turner. No. 2. John A. Goldsmith, Oakland, names gr s Romero, by H. W. Richmond, dam by Mambrino Pilot. No. 3. L. H. Titus names b m Belle Echo, by Echo, dam by Belmont. (Closed by agreement.)

FOURTH DAY—Thursday, Sept. 7.

NO. 11—TROTTING—Free to all two-year-olds; one mile and repeat; purse, $100; first horse, $240; second, $120; third, $40.

No. 1. L. J. Rose, San Gabriel, names br f Xelnska, by Sultan, dam Gretchen, by Mambrino Pilot. No. 2. S. Rosenner names b f Ruby, by Sultan, dam by Hambletonian; owner, J. W. Mackay.

NO. 12—SAME DAY—TROTTING—For all four-year-olds; purse, $600; first horse, $360; second, $180; third, $60.

No. 1. James Garland, San Francisco, names gr g Rowdy Boy, by Rustic, dam by Belmont. No. 2. A. Waldstein, San Francisco, names b s Albert W., by Electioneer, dam by John Nelson.

NO. 13—SAME DAY—RUNNING—SELLING RACE—Purse, $250; free for all; one-mile dash; second horse to receive $75; horses entered to be sold for $1,000; two pounds off for each $100 under fixed valuation.

No. 1. P. J Shafter, San Francisco, names blk h Haddington, by imp. Haddington, dam by Norfolk; valuation of horse, $800. No. 2. John H. Cardinell, San Francisco, names ch h Jack Douglass, by Wildidle, dam Lady Clare. No. 3. Wm. Boots, Milpitas, names ch c Inauguration, three years, by Wildidle, dam Miami by Belmont. No. 4. Henry Schwartz, San Francisco, names Sister to Lottery, three years, by Monday, dam Virginia. No. 5. J. T. Gilmer, Salt Lake, names ch c Euchre, five years, by Leinster, dam Flush; price, $800. No. 6. Stemler & Ayres, Portland, Or., names b g Joe Howell, by imp. Bonnie Scotland, dam Eva Shepherd, by imp. Sovereign.

FIFTH DAY—Friday, Sept. 8.

NO. 14—RUNNING—CONSOLATION PURSE—$250 for beaten horses; mile-and-a-quarter dash; second horse to receive $75; 10% entrance.

NO. 15—SAME DAY—LADIES' RIDING TOURNAMENT.

There will be several very choice and elegant prizes to be competed for, contributed by the merchants and citizens of Oakland and San Francisco; the lady winning first prize to have first choice, the second, second choice, and so on until all the prizes are distributed. Ladies wishing to compete for premiums will send their names to the President or Secretary on or before the first day of September, 1882, indorsed by at least two gentlemen of the society. Conditions will be published in the daily papers.

NO. 16—SAME DAY—TROTTING—2:25 class. Purse, $800; first horse, $480; second, $240; third, $80.

No. 1 Charles W. Welby, San Francisco, names Starr King, by George M. Patchen, Jr., dam May Wonder. No. 2. Jacks on Cochran, Chico, names Ashley, by Phinnas, dam by George. No. 3. L. J. Rose, San Gabriel, names blk s Del Sur, by The Moor, dam Gretchen, by Mambrino Pilot. No. 4. John A. Goldsmith, Oakland, names blk s Director, by Dictator, dam by Alambrino Chief. No. 5. J. H. Dodge, Stockton, names ch h Honesty, by Priam, dam by Chieftain. No. 6. L. H. Titus names br m Echora, by Echo, dam by Jack Hawkins. No. 7. G. Valensin, Arno station, Sacramento county, names ch s Crown Point. No. 8. James W. Learned, Stockton, names b s Reliance, by Alexander, dam Maud, by Mambrino Rattler. No. 9. John Hughes, San Francisco, names b h Cairo, by Chieftain; dam unknown.

NO. 17—SAME DAY—SPECIAL TROT AGAINST TIME—A purse of $50 will be given to any yearling making the best time; a full mile to harness; no entrance fee.

No. 1. J. C. Simpson, Oaklsud, names br c Antevo'o, by Electioneer, dam Columbine, by A. W. Richmond, gr d Columbia, by Bonnie Scotland. No. 2. Geo. Bayles, Petaluma, names ch c Dawn, by Nutwood, dam Countess.

SIXTH DAY—Saturday, Sept. 9.

NO. 18—COMPETITIVE CADET DRILL—PRIZE, $150 Gold Medal. Competition open to all educational institutions in the State.

NO. 19—SAME DAY—COMPETITIVE MILITARY DRILL—A prize of the value of $200 will be offered by the Association to the best drilled Military Company in the State of California. Rules and conditions to be published hereafter. It is the intent of the Directors to have the first competing companies determine what the prize or trophy shall be, and to have the same annually competed for, until it shall have been won three times by the same company, when it shall become the absolute property of the winning company.

NO. 20—SAME DAY—A BICYCLE RACE OF ONE mile, free for all, for a purse of $50, of which $35 to the first and $15 to the second; entrance free, the nominations to be made at the latest, on the first day of the Fair, at 3 P. M., with the Secretary at the track.

NO. 21—SAME DAY—TROTTING—Free for all; purse, $800; first horse, $480; second, $240; third, $80.

No. 1. I. H. Coldsmith, Oakland, names b s Gibralter, by Echo, dam by Belmont. No. 2. John A. Goldsmith, San Francisco, names b m Sweetness, by Volunteer, dam by Edward Everett. The above not filling, the Management have offered a purse of $800, free for all trotters and pacers, with four moneys.

NO. 22—SAME DAY—A SET OF HARNESS, of the value of $125, will be offered for gentlemen's roadsters; best two in three; owners to drive.

By a "gentleman's roadster," is meant any animal owned and driven on the road by any gentleman for his own private pleasure. No. 1. W. E. Dargie Oakland, names b g Phillip. No. 2. Robert Noblett, Oakland, nam s br g Prophet. No. 3. James M. Learned, Stockton, names Ollie Ray. No. 4. Sawyer, Oakland, names b g Emperor, by Ralston, dam Katy Tricks.

CONDITIONS.

All the trotting and pacing races are the best three in five. When there are eight or more starters in a trotting race, 150 yards to be a distance.

National Trotting Association rules to govern trotting, but the Board reserves the right to trot heats with any two classes alternately, if necessary to finish any day's racing, or to trot a special between heats.

Those who have nominations in stakes must name to the Secretary, in writing, the horses they will start on Monday, on the Saturday previous; and on Wednesday, the Monday previous; and on Friday, the Wednesday previous. No added money will be paid for a walk over.

Horses entered in purses can only be drawn by consent of the judges.

Rules of the Pacific Coast Blood Horse Association to govern running races, except as above specially provided.

Write "Entries to races" on outside of envelope.

L. WALKER, Secretary. A. C. DIETZ, President.

DIRECTORS.—A. C. Dietz, Hon. J. F. Houghton, W. E. Miller, W. E. Hale, D. F. Majors, J. B. Watson, Chas. H. Cushing, R. P. Clement.

A. C. Dietz, Pres. L. Walker, Sec'y.
Capt. J. A. Maybew, Supt. Park.

Guide to Silk Culture.

A Useful Manual for Beginners.

The "Silk Growers' Manual," by W. B. Ewer, contains, in a condensed and clear form, instructions for the sericulturist. We advise our lady friends to buy a copy.—*Fresno Expositor.*

Furnishes in a brief and explicit manner all necessary information in the matter of silk culture.—*San Jose Mercury.*

An interesting compilation to encourage home silk culture in California. Everybody should read it.—*Anderson Enterprise.*

Anyone interested in silk culture will find this full of valuable information.—*San Joaquin Valley Review.*

Furnishes all necessary information to begin the silk business.—*Marysville Appeal.*

It is a very interesting little work, and well worth the price.—*Mendocino Beacon.*

It is worthy the perusal of all interested in silk culture.—*Concord Sun.*

Copies of "The California Silk Growers' Manual" mailed from this office for 25 cents each.

Our Agents.

OUR FRIENDS can do much in aid of our paper and the cause of practical knowledge and science, by assisting Agents in their labors of canvassing, by lending their influence and encouraging favors. We intend to send none but worthy men.

G. W. McGREW—Santa Clara county.
M. P. OWEN—Santa Cruz county.
J. W. A. WRIGHT—Merced, Tulare and Kern counties.
JARED C. HOAG—California.
R. W. CROWELL—San Luis Obispo and Santa Barbara counties.
T. F. THORNTON—Sonoma Co.
WM. M. HOWES—Amador Co.

Old Papers Wanted.

Twenty cents each will be paid for a limited number of copies of any of the following Nos. of the MINING AND SCIENTIFIC PRESS, if received soon at this office: No. 1, of Vol. 13, 1866; No. 6, Vol. 18, 1869; Nos. 1 and 26, of Vol. 20, 1870; No. 1, of Vol. 22, 1871. Also, 10 cents per copy for Nos. 2, 3, 4, 7, 10, 11, 12, 13 and 15, of Vol. 30, 1875. If any one who has files of back volumes of the PRESS, which they may like to dispose of at a moderate rate, will send us a memorandum of the same and the price, we may be able, sooner or later, to assist in their disposal.

MECHANICAL PROGRESS.

Notes on Water Power.

"Efficiency," "useful effect," or "percentage," are terms used to denote the economy of a wheel in its use of water, or the number of gallons it will pump back into the pond for each 100 gallons drawn therefrom to drive the wheel. There are wheels that for each 100 gallons used will return but 25; others will return 50, while medium wheels return 75, and a better class 80 to 85. The very highest, under favorable circumstances, will return something over 90 %, and of course, other merits being equal, are by far the most desirable.

What is the real working head? The term "head," as used in connection with water power, means the difference in hight from the surface of water in wheel-pit to the surface in penstock above, when the wheel is running.

A square inch of water means a stream exactly an inch square; its length depending upon the head from which it issues. For a head of four feet, it means a stream an inch square, 16·04 ft. in length per second; for a head of 100 ft., a stream an inch square, 80.35 ft. in length per second. To turn this into cubic feet, multiply by 12, then divide by 1,728.

Pressure of water on dams depends on the depth, and is the same whether the pond covers one foot or 10,000 acres.

Turbines of any make are not perceptibly affected by backwater, except through loss of head. I think a slight difference was found by a commission appointed by the French government to experiment with the Fourneyron wheels. I have in two or three cases, when long draft tubes were used, thought the loss greater than should occur from the loss of head, but have had no chance to determine the matter by actual test.

Many builders insist that it is essential that a turbine should discharge under water; but it is doubtful for the same head whether it makes any difference, if the wheel is properly made, though it prevents a trouble from ice, and generally extra head is gained by submerging the lower part of wheel.

If a draft tube for any considerable proportion of the head is used, its lower end should be submerged to such a depth as to render its immersion constant, otherwise, when first starting up, only the head above the level will be available until the discharge has exhausted the air from the tube; then when it does take hold, unless the gate of the wheel works very quick, the speed is wild for a short time. When there is backwater for some length of time, a short draft tube renders it convenient to get at the wheel in case it is necessary to do so; but in most cases I should prefer to have the lower part of a turbine stand in the tail water.

A turbine is no more a hydraulic motor than the harness of a horse is a horse motor. A turbine simply transmits the power of a motor, or the power evolved from falling water. Consequently the power it may give out depends upon its efficiency, capacity, and the head under which it works. The same wheel may be placed where it may easily transmit a hundred-horse power, or be over-loaded in attempting to transmit one.

Is there any turbine made that, on a variable stream, in efficiency can equal the overshot? Yes, plenty of them that will not only equal but far surpass the best overshot wheel ever constructed, at either whole or part gate, whether the supply of water is constant or variable.—*James Emerson.*

A NEW ELECTRICAL INVENTION.—An invention, by which the loss of power resulting from the rapid reciprocating movement in electro-magnetic motors, in which the vibration of armatures is utilized for power, is avoided, was recently patented by Mr. John Du Bois Kiely, of Toronto, Canada. An endless belt extends around rollers and through the magnets, and has cylindrical armatures attached to it at regular intervals. The armatures are slightly longer than the distance between the magnets, and the space between them is equal to twice their length. The belt rollers are fast on their shafts, one of which carries also a balance-wheel. The rollers are flattened on two opposite sides, to receive the armatures and to prevent slipping. Each magnet is provided with a circuit closer, consisting of a bell-crank lever, one end of which projects into the path of the armature, so that when pressed down by the advancing armature, the lever closes the circuit to the magnet next in advance. This occurs when the armature has passed the point of maximum attraction in one magnet and broken the circuit by its rear end clearing the lever. The armature belt is moved by a draught acting continuously in one direction of the armatures, thus avoiding changes of direction and utilizing the momentum.

ELECTRICAL MOTORS have now been introduced at several French collieries. A Gramme machine has been in use for some time past at the Blanzy mine; and others are at work in the Thibaud mines, belonging to the Terre-Noire company, and at the mine de la Peronniere,

A GOOD RIVET, cold, should bend double without breaking. The head should flatten out, when hammered hot, to ½ inch thick without fraying at the edge or breaking. Boiler plates should be caulked with a convex tool.

The Steam Street-Car Problem.

Late advices from Paris report the fact that the managers of the street-car lines of that city, after persistent and continued experiments continued for the past five years, during which time they had tested the merits of no less than 21 forms and modifications of steam motors, have finally abandoned the attempt and gone back to horses.

Such a conclusion appears to be contrary to our accepted notions of progress, but it is practically the same result as that reached several years earlier by the street-car companies in a number of American cities. The conclusion is to be regretted, as the substitution of some economical motive power to take the place of animal traction for this service would be attended with many advantages from a sanitary and humanitarian standpoint. Perhaps the electric railway, which has lately been successfully introduced in Berlin, and which is spoken of with much enthusiasm by all who have had the opportunity of witnessing its operation, may be the initiation of a departure that will ultimately solve the vexed question.

Whatever the future may have in store for us in this direction, it appears to us that, with the benefits of the experiments and failures with steam in Paris and in our own cities, inventors should find the problem of devising a safe, practical and economical motor for street cars not impossible to solve. The cable system in use in San Francisco and Chicago seems to have proven a very satisfactory method, and may be the solution of the problem.

The capabilities of compressed-air engines, however, do not seem to have received that attention which their merits deserve, although the system appears to be free from most of the objections urged against the use of steam, and no special objections have been urged against it which have come to our knowledge.

TIRES of mixed metal—half iron and half steel—are now being manufactured in Europe. The body of the tire is composed of a ring made of pieces of puddled steel and inserted between two hoops of fine iron. The whole is welded together by the hammer. The process of manufacture is described as follows: A bar of fine iron, which is to serve as the core, is first rolled, and then a hoop of fine iron is put on at each end cold. Wedges of puddled steel are then placed obliquely in the space between the two hoops, thus making so many spirals inclined on the axis of the tire. This arrangement brings the wedges together when the hammer is applied, and thus a complete welding is obtained. The wedges are cut from rolled bars, and the round pieces are forged and welded with the stamper. Four heats are necessary to obtain a roll like those used in ordinary processes. This process has not been entirely perfected, but it is believed that it will prove a valuable departure from the usual method. The claim for these tires is that they have all the hardness of those made entirely of steel, without their liability to break.

NICKLE PLATING BY BOILING.—Dr. R. Kaizer, according to the Bavarian *Gewerbe Zeitung*, prepares a bath of pure granulated tin, argols, and water, heats it to boiling, and then adds a small quantity of red-hot nickle oxide. A portion of the nickle, as is shown by the green color which the solution assumes, that is, above the grains of tin, is immediately dissolved. If a copper or brass article he now immersed in this solution, it almost immediately becomes covered with a silver-like coating, which consists of almost pure nickle. If a little cobalt carbonate or cobalt tartrate be added to the bath, a bluish tint is produced, which may be made lighter or darker according to the quantity added. When the article is rubbed with dry sawdust or chalk, a very brilliant polish is obtained.

EXPANSION OF METALS ON COOLING FROM FUSION.—An interesting series of experiments are reported to have been made by Messrs. Nies and Winkelman on the changes in volume of a number of metals on cooling from fusion. Of the eight metals (tin, lead, zinc, bismuth, cadmium, antimony, iron and copper) submitted to investigation, six—namely, tin, zinc, bismuth, antimony, iron and copper—expanded at the moment of solidification, so that the solid is less dense than the liquid metal. The results obtained with the remaining two metals were not decided, though it is believed that they also expand on solidification. The authors are of opinion that their experiments indicate the existence of the general law that all metals expand on solidification.

TO AVOID RUST.—Iron and steel goods of all descriptions are kept free from rust in the following manner: Dissolve one-half ounce of camphor in one pound of hog's lard; take off the scum, and mix as much black lead as will give the mixture an iron color. Iron and steel goods, as well as machinery of all kinds, rubbed with a linen cloth, will keep clean for months. If the machinery is for exportation, it should be kept thickly coated with this during the voyage.

IRON THAT RESISTS ACIDS.—A German patent has just been taken out for the manufacture of hotties, etc., from cast iron, containing 12% of silicum, a compound which is said to resist the action of the strongest acids. It is also recommended for the iron plates of zinc and iron galvanic batteries.

SCIENTIFIC PROGRESS.

ANOTHER endeavor to raise the position of gas as a rival of electricity appears in an invention by M. Clamoud, in which the gas is burnt with an air heated to 1,000° C., the combustion taking place within a cone or basket of magnesium wire, which, raised to incandescence, forms a light center of remarkable softness, steadiness and brilliancy. M. Clamond has succeeded in so grouping the heating and the mixing chambers that the whole burner may be enclosed in a cylinder about two and a half inches in diameter and four and one-half inches in hight. One-horse power, it is stated, suffices for an illumination of 150 to 200 burners. A modification of the above seems also to have been experimented upon in England, as follows: A gas lamp is employed composed of two pipes, one of which supplies gas in the ordinary way, and the other air slightly compressed by the weight of a column of water. Upon the burner is a cap of fine platinum wire gauze which, a few seconds after the current of mingled gas and air has been ignited, gives forth a brilliant incandescent glow, like that of the electric lamp. Arrangements have been made for lighting a number of London thoroughfares with this light, which, it is asserted, is cheaper than the ordinary gaslight.

ARTIFICIAL QUININE.—E. J. Maumine, of Paris, claims to have made the discovery of a method of manufacturing quinine artificially, or by synthesis. He has deposited a sealed packet with the French Academy, which is accompanied with the following open letter: "The discovery of H_2N has just furnished me with the means of realizing a synthesis desired by all chemists, and the object of a reward offered by the society. This synthesis is that of quinine. I would at once communicate to the Academy the details of the very simple operation in which H_2N furnishes very pure sulphate of quinine, if it were not proper that I should first submit to medical proofs the sulphate, all the properties of which are identical with those of the sulphate prepared from quinquina." This discovery, if genuine, is a very important one; but it is questioned in certain quarters, from the unprofessional way, from a scientific standpoint, in which the announcement is made. The sealed packet method is not the way the true scientific discoverer usually takes to announce his discoveries.

HOW COAL IS FORMED—SOME NEW IDEAS.—Prof. Reinsch, in a lecture lately delivered, gave the results of his researches regarding the manner in which coal had been formed. He had examined with the microscope not less than 2,500 sections of coal, and had come to the conclusion that coal had not been formed by the alteration of accumulated land plants, but that it consisted of microscopic forms of a lower order of protoplasm, and although he had carefully examined the cells and other remains of plants of a higher order, he computed that they have contributed only a fraction of the mass of coal veins, however numerous they may have been in some instances. He referred to the fact that Dr. Muck, of Bochum, held that algæ have mainly contributed to the formation of coal, and that marine plants were rarely found in coal because of their tendency to decompose, and that calcareous remains of mollusks disappeared on account of the rapid formation of carbonic acid during the process of carbonization.

A RIVAL FOR SUGAR, POSSIBLY.—At a recent meeting of the German Technical Society, Dr. Constantine Fahlberg read an interesting paper describing a scientific research, which had resulted in his discovery of a new body, possessing to an eminent degree the property of sweetness. The new substance would be called, in chemical language, "anhydro-sulphaminbenzoic acid." It is a white crystalline substance, very soluble in alcohol, but sparingly soluble in water, and has the property of sweetness to such an eminent degree that the merest trace of the alcoholic solution in water suffices to impart a distinctly sweet taste to it. The discoverer estimates that it has from 20 to 30 times the sweetness of cane sugar. The new substance may come in time to have important technical uses.

TO CONDENSE MOISTURE IN THE AIR.—Mr. A. H. Smee fills a glass funnel, drawn out to a point and closed at the bottom, with ice. The dew which condenses from the air on the cold sides of the funnel collects in drops, which run down over the closed point into a capsule. The quantity of water condensed in a given time may be measured, and the ammonia determined colorimetrically. By this cold distillation, it is possible to concentrate bodies which are decomposed at higher temperatures, *e. g.*, the odors of flowers. In the condensed dew may be found the microbia, or parts of such, thrown off from the body in disease.

THE HORSE IN EARLY TIMES.—The most ancient monuments of Mesopotamia and Egypt contained no mention of the horse, while the creature represented in Assyrian monuments had the tail of an ass. The first literary mention of the horse in Egypt belonged to a period of about 18 centuries before Christ. From that time notices of horses in Egypt were frequent and common.

THE DARWINIAN CREED.—Those who themselves explicitly reject the Darwinian creed, yet cannot possibly escape from many of its implications. It runs through almost all the best thought of our time; it tinges our unformed public notions; it reappears under a hundred disguises in works on law and history, in political speeches and religious discourses, in artistic theories and vague social speculations. Our very novels and poems are full of latent Darwinian germs. If we try to think ourselves away from it, we must think ourselves away entirely from our own age. Whoever builds at all must build largely from materials supplied by Darwin or by Darwinians. Whoever deals with social forces must deal with forces greatly molded and remodeled by Darwinian ideas. The physician who wholly neglected Darwinian results would fall behind in the race—would, in fact, be naturally selected for quiet extinction; the statesmen who wholly overlooked the political and ethical implications of the Darwinian belief, the strength of the new intellectual factors introduced by Darwinism, would be incapable of really guiding the political thought of to-day.—*Manufacturer and Builder.*

MELLOGEN.—Mellogen, the new substance obtained by Signors Bartogli and Papasogli in their recent remarkable experiments of electrolyzing distilled water about six weeks—first with strong, then with weaker batteries and carbon electrodes—is a solid, dark, very shiny matter, soluble in hot water and in alkalies, insoluble in most mineral acids and in ordinary solvents, such as alcohols or benzine. It does not fuse, is not crystallizable, burns difficultly and has strong coloring power. Its most salient property is its combining easily with oxygen, and giving rise to acids of the benzocarbonic series. The best oxidant is hypochloride of soda. The formula of mellogen is $C_{11} H_2 O_4$. If alkaline solutions be used as electrolytes in place of distilled water, mellic and its congeners are largely formed, but very little mellogen; on the other hand, with an acid electrolyte, the mellogen is abundant, and the former products are almost wholly wanting.—*Scientific American.*

ARTIFICIAL METALLIC CAESIUM.—Setterberg has prepared caesium in considerable quantities by the electrolysis of a mixture of four molecules of caesium cyanide and one molecule of barium cyanide. The metal obtained was almost chemically pure, showing in the spectroscope only a trace of sodium. Caesium closely resembles the other alkaline metals. It is silver white, malleable and very soft at ordinary temperatures. Thrown on water it bursts into flame and swims about on the surface like potassium and rubidium. It inflames spontaneously in the air when not protected, and is the only metal that behaves in that manner. Caesium, it will be recollected, was discovered nearly 20 years ago by Bunsen, together with rubidium, in exceedingly minute quantities, in the waters of the Durkheim mineral spring. Its discovery was made with the aid of the spectroscope, then just devised.

TELEGRAPHING AND TELEPHONING SIMULTANEOUSLY OVER THE SAME WIRE.—A Belgium scientist with an unpronounceable name has perfected an appliance whereby electric wires and submarine cables may be used for telephonic communication simultaneously with the electric message. In a recent experiment, a message was sent from Brussels by the telegraph to the Director of Telegraphy in Paris, and an oral message sent by telephone over the same wire was distinctly heard while the Morse receiver was in action. It is claimed that this improvement will enable the business men of New York to telephone their correspondents in London and Paris quite as readily as their neighbors about the city.

CONVERTING A NEGATIVE INTO A POSITIVE.—Capt. Bing, of Paris, has devised an ingenious method of making a positive on glass from a negative, and on the same glass. The back of the negative is covered with soluble bitumen or asphalt and then illuminated through the negative. After an exposure sufficient to render the right portion insoluble, the remainder of the asphalt is dissolved off with any of the usual solvents, leaving a positive. The silver negative is then dissolved off with the chloride of copper and a fixing agent, such as cyanide or hypo.

THE ACTION OF LIGHT ON OXYGEN.—M. Dessans is authority for the statement that oxygen is converted, by the action of intense light, into ozone. He has devised an apparatus for governing the admission of the radiations of a Drummond light into a jar of oxygen; and as the result of frequently repeated experiments, he affirms the fact of the direct transformation of the oxygen into ozone.

THE absence of individual death is shown to be a characteristic of the protozoa, by Dr. O. Butschli. These mono-cellular animals cease to exist as such in the act of propagation, but the individuality of each is split up into two new individualities of its offspring. A protozoan may die by accident, but it does not necessarily carry, like the higher animals, the germs of death in itself.

TUNGSTEN IN MAGNETS.—Mr. Le Neve Foster has been studying the manufacture of permanent magnets. He has succeeded in producing some very powerful ones from steel containing from two to three per cent. of tungsten,

Mining Share Market.

The market has been comparatively strong and active for a few days. As will be seen by our stock table, the business has been larger than for some time past, with steady prices.

At Gold Hill the Yellow Jacket, Belcher and Crown Point companies are taking out a considerable amount of low-grade ore from their old upper levels.

At the south end very little is now doing. The Alta folks are now ready to resume pumping, but are negotiating with the Sutro Tunnel company in regard to connecting with their south branch.

At the Chollar-Norcross-Savage shaft the sump has been completed, and a station is being cut out from which to start a west drift on the 2600 for the vein. This drift will be sent ahead as fast as men and powder can drive it. It is thought it will reach the body of quartz found above in going about 400 ft.

The completion of this drift to the vein will not only afford a drain for the water, but will also make an opening by which the several middle companies may resume active operations in ground known to contain some ore.

OLD GLOBE COPPER MINES.—Mr. J. W. Williams, Superintendent of the Old Globe copper mines, is in the city. This property is located close to Globe City, and has now a 30-ton waterjacket smelter, manufactured by Rankin, Brayton & Co., Pacific Iron Works, of San Francisco. The average per day is 15 tons, producing from eight and one-fourth to nine tons of fine copper bullion. In 45 days this smelter has reduced 3,678,705 lbs. of ore, producing 712,350 lbs. of bullion. The mine shows a large body of ore, clearly traceable for 1,000 ft. The vein is between lime and syenite, and is developed by a crosscut 100 ft., and the hanging wall is not yet struck. In one stope there is over 20 ft. of solid ore which will yield 25% copper. There are thousands of tons of ore in sight near the surface. Mr. Williams thinks the Old Globe a magnificent prospective property. The Long Island company is also putting up a 30-ton smelter, which will be completed and turning out copper next month.—*Arizona Star.*

TRIBUTE WORKING.—The Grass Valley *Tidings* says: We publish an article from the Eureka (Nev.) *Sentinel* about the subject of working mines by tribute. The question as to the advantages and disadvantages of working mines by that system is being much discussed in Nevada State. Tribute mining has been going on in Grass Valley time out of mind, so far as we know, and there has been no talk about it. We believe in giving tributers a chance when they want it, and are not in favor of keeping a mine shut down and idle because by letting some one work in it some one may make some money by the work. We do not know of any "tributers" in Grass Valley who have made fortunes, but we know of many who have made good livings for their families, and who have kept mines alive. We think the Comstock lead would be better off with some tribute work, unless that system runs too strong against the stock-selling way of working mines.

DURING the first six months of this year the Leadville mining companies paid an aggregate of $1,105,000 in dividends. A large portion of this found its way East.

THE American Institute of Mining Engineers has closed its meeting at Denver, Colorado.

Recent Contributions to the California State Mining Bureau.

[Furnished for publication in the MINING AND SCIENTIFIC PRESS by HENRY G. HANKS, State Mineralogist.]

[CATALOGUE.]

4163. Link of an Iron Chain—Found at the camp of the lost emigrants in Death valley, Inyo county, Cal. (See No. 2983.) James E. Parker. The following is an extract from the Inyo *Independent*, of Aug. 12, 1882:

RELICS.—Some weeks ago the *Independent* recorded the fact that a relic (an iron ring) of the ill-fated immigrant party in Death valley had been found, and would be sent to the State museum. Prof. Hanks acknowledges the receipt of the memento, as follows: "Your letter of July 10th came to hand, as did the Death valley relic referred to. We have a rusty pocket-knife from the same locality, which, together with the ring sent by you, I consider valuable historic relics and a desirable addition to the State museum." The knife was found and presented to the museum by Mr. T. F. A. Connelly, of this place.

4164. Incisor Tooth of an Undetermined Animal—Found in volcanic tufa, in close proximity with the tusks of an elephant, in 1865, 10 ft. below the surface, at Murphy's Camp, Calaveras county, Cal. W. Jones, M. D.

4165. Pecten irradians, Lam.—New Jersey. J. Z. Davis.

4166. Gold Quartz—Dudley mine, Meadow Lake district, Nevada county, Cal. Charles Dudley.

4167. Barite (Sulphate of Baryta)—Found also as a gangue with silver ores, Calico district, San Bernardino county, Cal. John Daggett.

4168. Auriferous Quartz (Tellnric)—Jones mine, Carson Creek, Calaveras county, Old Carson Creek gold and silver mining company. W. Jones, M. D.

4169. Gold in Mispickel (Arsenical Pyrites)—Near Georgetown, El Dorado county, Cal. L. L. Alexander.

4170. Portion of the Tusk of an Elephant or Mastodon—From the Indian Spring drift mine, Butte county, Cal., 320 ft. below the lava. A. D. Paul.

4171. Tusk of a Boar or Peccary—Found 1,700 ft. in tunnel and 300 ft. below the lava and gravel, and near the elephant's tusk, No. 4170. Indian Spring drift mine, Butte county, Cal. A. D. Paul.

4172. Molybdenite (Sulphide of Molybdenum)—Near Lewis, Lander county, Nev. J. W. Statler, Jr.

4173. Cyprina expansa (Cretaceous Fossil)—Maryborough, Queensland, Australia. Queensland museum, Brisbane.

4174. Inoceramus problematicus (Cretaceous Fossil)—Marathon station, Flinders river, Queensland. Queensland museum, Brisbane.

4175. Cucullæa robusta (Cretaceous Fossil)—Maryborough, Queensland. Queensland museum, Brisbane.

4176. Avicula hiendsensis (Cretaceous Fossil!—Hiendsen station, Upper Flinders river, Queensland. Queensland museum, Brisbane.

4177. Nucula quadrata (Cretaceous Fossil)—Maryborough, Queensland. Queensland museum, Brisbane.

4178. Glossopteris browniana (Carboniferous Fossil)—Dawson river, Queensland. Queensland museum, Brisbane.

4179. Filicites lineata (Carboniferous Fossil)—Denmark hill, Ipswich, Queensland. Queensland museum, Brisbane.

4180. Pecopteris odontopteroides, Morr's (Carboniferous Fossil)—Tivoli mine, Ipswich, Queensland. Queensland museum, Brisbane.

4181. Chromic Iron—Strongly resembling the ores found in California. Queensland. Queensland museum, Brisbane.

4182. Galena—Northcote, Queensland. Queensland museum, Brisbane.

4183. Pyrolusite (Binoxide of Manganese)—Passim, Queensland. Queensland museum, Brisbane.

4184. Coal—Ipswich, Queensland. Queensland museum, Brisbane.

4185. Cinnabar (Sulphuret of Mercury)—Kilkivan, Queensland. Queensland museum, Brisbane.

4186. Camel Coal—Queensland. Queensland museum, Brisbane.

4187. Cassiterite (Lode Tin Ore)—Passim, Queensland. Queensland museum, Brisbane.

4188. Opal in Matrix—Barcoo, Queensland. Queensland museum, Brisbane.

4189. Pimelite (Silicate of Nickel and Alumina)—(See Dana, No. 466.) Queensland. Queensland museum, Brisbane.

4190. Selbite (Carbonate of Silver, Antimony and Copper)—Supposed to be a mechanical mixture of argentite, dolomite and silver. (See Dana's Supplement.) Golden Age Reef, Boorok, Queensland. Queensland museum, Brisbane.

4191. Gold in Red Copper Ore—Queensland. Queensland museum, Brisbane.

4192. Gold in Limonite—Queensland. Queensland museum, Brisbane.

4193. Gold in Calcite—Queensland. Queensland museum, Brisbane.

AT Salt Lake the Utah Commissioners adopted rules for the registration of voters in the November election for delegates to Congress. Supervisors of registration are to be appointed for each county, and the lists now in the hands of the County Clerks will be taken, and each person whose name appears on the list will have to take an ironclad oath that he is not in polygamous relations. Failing to do this, his name is stricken off the register. They have power, also, to strike the names of polygamists off arbitrarily.

MINING SUMMARY.

The following is mostly condensed from journals published in the interior, in proximity to the mines mentioned.

CALIFORNIA.

AMADOR.

MODOC.—*Ledger*, Aug. 26: This prominent mine in Pioneer district had a clean-up at Mace's mill, which yielded bullion to the amount of $4,730, or a little over $47 to the ton. They have over 50 tons of ore now on the dump, which is estimated to be worth from $75 to $80 per ton. The mine is not worked very energetically. It is owned jointly by J. Ham and F. Mace.

GRASS VALLEY HYDRAULIC.—The process of cleaning up is about completed. The company intends putting up a pump and derrick to hoist pay dirt and keep the water out of a deep pocket which has been found on the claim. This hole, as far as prospected, is exceedingly rich, but it cannot be worked without pumping and hoisting machinery.

JACKSON.—The 10-stamp mill of the Moore mine is being put in running order, for the purpose of crushing rock from the Jackson of Cinocchio claim. It will be a week or two yet before they get to crushing. Mr. Peck, one of the principal investors in the prospecting operations now being conducted on this mine, was in Jackson this week, and expressed himself as pleased with the outlook. The quartz prospects handsomely, and there is every reason to believe that it will pay a fair profit by mill process. The main question that remains to be answered is as to the extent of the ledge. This cannot be determined until the shaft is put down a couple of hundred feet deeper. Until this is done, nothing can be said of the merit of this property as a permanent mine.....The Phenix reduction works are kept steadily running on sulphurets from the Empire and Pacific mills of Plymouth. These works are kept running more regularly than any other chlorination works in the county, except the Zeile.....It is reported in Plymouth that the Empire mine will fall into the control of A. Hayward after this month.

ALPINE.

REPAIRS.—*Monitor-Argus*, Aug. 26: In consequence of the improvements and necessary repairs that will be made by the Isabelle G. & S. M. Co., the Exchequer mill and Stelbs mine are temporarily closed down.....The Alpine gravel mining company is piping the grounds of its claim a short distance south of where it first commenced washing, and it is earnestly hoped that they may make a successful clean-up.....L. Chalmers, Esq., manager of Isabelle G. & S. M. Co., after an absence of almost 3 months at the home office of the Isabelle company in London, returned last Wednesday to his home near Silver mountain.

CALAVERAS.

SILVER.—*Mountain Echo*, Aug. 23: Recent developments in the Jones mine prove it to be one of the richest silver mines in the country, in fact, bids fair to rival the famous mines of Nevada. At a depth of a little over 40 ft, a well-defined ore body was struck, which ranges from 8 to 12 ft in thickness. The ore carries a large amount of sulphurets of immense richness. A mill for reducing the ore will be erected in a short time, when large returns may be reasonably expected. Experts from all parts of the country pronounce the Jones mine one of the most valuable mines on this coast.....A visit to the Gold Cliff mine the other day satisfied us that it is one of the richest and most extensive mines in the country. Machinery for reducing the ore is being rapidly erected. The mill is entirely different from any we have ever seen in use. It is called a pulverizer, and it is said will reduce 100 tons of ore per day. The proprietor tells us that if the mill proves a success, he will immediately erect 4 or 5 more of the same pattern. The tunnel through which the ore is to be brought to the mill is now in 210 ft, and is passing through a kind of indurated talc, which carries a large per cent. of sulphurets of iron, and which assays $125 per ton. Mr. Drake, the owner and proprietor of this wonderful mine is a man of large experience in mining operations, and is evidently working the mine upon scientific principles.

UPPER COUNTRY MINING NOTES.—Cor. Calaveras *Chronicle*, Aug. 26: The Lone Star mine is being worked steadily along by its owners, Messrs. Reed & Hillary. A shaft has been sunk 130 ft in depth from the surface, to connect with the lower tunnel. The connection will be made in a day or two, which will give good air to the miners.....Messrs. Steger & Co. are making splendid developments in the Anna mine, situated south of the Lone Star. This mine has a splendid shaft down, connected with a tunnel, through which the rock at present is taken out. The vein is from 20 inches to 3 ft in width, and mostly all pay rock. About 20 tons of ore are on the dump. The last taken out paid nearly $30 per ton.....The Champion is still being put down; depth attained, about 850 ft on the incline.....The celebrated Ben Carlton mine, situated west of the Champion, has been bonded to some gentlemen from Sacramento. The mine in past years has spoken for itself, having always had a good record.....The Star of the West mine looks very good at its present depth, which is about 120 ft. The company has two levels run. The one north is in about 80 ft, and the one south about the same distance. We were shown a good vein all along the levels, which are still being run each way on good quartz, and probably will not stop inside of 100 ft more. We believe the owners intend sinking 100 ft deeper, and keep the levels going at the same time. The mine is worked by a small engine, which the owners intend shall only be used to prospect the mine, when they will replace it with one of a larger capacity. There are about 150 tons of good rock on the dumps, which shows plenty of gold to the naked eye. Some is very heavy sulphureted quartz.....The Couldson mine is being re-opened by capital. The owners are going to work it by steam power. A large pump passed through town the other day, which, if made to work, will handle all the water in that mine, the owners have to contend with. As soon as the machinery is ready, sinking will be commenced. Present depth of shaft, 40 ft.....We understand that the St. Patrick and Doyle mines have changed hands. The Doyle mine is now known as the Mountain Chief, and is owned by Hansen & Co. Present depth of shaft, 75 ft. As soon as machinery arrives, operations will be commenced.....Sterling & Co. are taking out rich rock from the Pride of the West mine. Width of vein from 12 inches to 2 ft. Rock prospects to the horn $50 per ton.....The owners of the French lode are at present grinding the quartz recently taken from their mine.....Otto Mentzel & Co. are taking out good rock from the north extension of the Gold Rattlesnake mine. The last rock averaged $30 per ton.....Placer and quartz bullion shipments, since last report, $12,000.

WEST POINT.—The Champion, Star of the West, Whisky mine, and, in fact, all of the mines in this vicinity are being worked vigorously, and appearances are encouraging. Yet, who knows of these but we West Pointers? Custom mills are nearly all busy crushing ore, and have been during the summer.

FRESNO.

KING GULCH.—Cor. Mariposa *Herald*, Aug. 25: Last week, the King Gulch mine was reported sold for $25,000, but on inquiring, I find the report untrue, as they ask a larger price for it. Mr. Fowler, of San Francisco, a mining expert, was here last week to look at this mine, and he speaks very highly of it.....Wm. Cibbons has sold his one-third interest in the Antelope mine to Chris. Lansen. Consideration, $80, which is considered giving it away.

INYO.

THE KEYNOT.—Inyo *Independent*, Aug. 22: A. Chavaune and J. Lematre, the capitalists who were formerly here looking after the famous Keynot with a view to investment, arrived in town Thursday last, and went out the next morning to Lone Pine. It looks very probable now that a sale will be made.

MARIPOSA.

YOSEMITE MINE. Cor. Mariposa *Herald*, Aug. 25: M. Hullings & Co. have, for the present, discontinued work on the Pool mine. The shaft is down 150 ft, showing a ledge from 6 to 7 ft wide in the bottom, and which was almost nine-third sulphurets. Their mill not being equipped to work sulphurets, the superintendent considered it a waste of time and ore to work the mine until they were prepared to treat the sulphurets. The expense, too, of working three mines—the No. 9, Pool and Mt. Gains—no doubt had its weight in the matter. . . . The work at Mt. Gains, which has been going on for a number of months past, is, to all appearances, to be rewarded shortly by striking the ledge. This is looked for some time during the present month. . . . The No. 9 holds forth as usual. Owing to the small quantity of water, but 20 stamps are running. The shaft in the south end of the mine is down 200 ft or more, and is in a ledge 7 ft thick. . . . . Frank Sullan, an Austrian living not far from the Quartzburg schoolhouse, lately struck a pocket in what is known as the No. 2 quartz ledge, and took out some 600 ozs, $10,000. . . . . John L. Smith, of Juniper fame, is around occasionally, and has struck a new mine on the Merced river. Four teams are engaged in hauling quartz from Quartz mountain to the Washington mill. The vein is said to be large, and the ore of excellent quality. . . . . The Phillo Moser vein, in Hunter's valley, is looking up. It is no doubt a fine mine, and will largely repay the outlay necessary to develop it.

NEVADA.

THE RUBY MINE *Transcript*, Aug. 26: In speaking of the strike recently made in the Ruby drift mine, at Forest City, the *Tribune* says: The last raise made for the channel was at a point about 600 ft out from the main tunnel. The raise was put up 50 ft above the upper drift, this making the hight in where gravel was encountered 100 ft above the main tunnel. A washing was made last week from which an estimate proved the ground to be paying 75 cents to the square foot. Mr. Jennings had with him a fine specimen quartz stone. The piece was literally alive with gold, and was said to contain $300. In order to further increase the water supply, a new flume 2,000 ft long, running from Rock creek, is being constructed. When this is completed, washing can be begun on a more extensive scale, and employment will be given to 40 more miners in the next 4 weeks.

THE IMPERIAL MINE—*Tidings*, Aug. 22: The shaft of the Imperial Extension mine is now down about 102 ft, and water was reached on Saturday last. It is the intention of the company to keep sinking for nine week more, in case the water does not come in too large a body, and then cut the ledge and take out quartz for the mill to crush.

PLACER.

AMERICAN RIVER CLAIM.—Placer *Argus*, Aug. 26: Wm. H. Williams and son Sam have got the flume-way completed in their river claim, about 12 miles above here on the American river, and have commenced shoveling the gravel from the river bed into the flume. They have built a flume large enough to carry the whole river, and will work out the bottom by shoveling. The gravel is very rich, and it will take but a short time to clean up a large quantity of gold. The only thing to be feared is the sudden raise in the river, later in the season, and washing away their flumes. It has done it before.

ALTA. The chrome business seems to be booming here at present. Messrs. Price, Morse & Strong have shipped about 10 tons of chrome in San Francisco lately. They are working on a ledge which Mr. Strong claims to be the "biggest thing" of its kind ever found in the State.

PLUMAS.

MILLING TEST.—Greenville *Bulletin*, Aug. 26: The proprietors of the Providence mine have now opened up so much of the ledge that they are desirous of having a milling test made of the value of the ore. For this purpose an agreement has been made to have 100 tons or so of the ore crushed in the Cherokee company's mill. The Providence mine is but a short distance from the mill, and a road can be very easily made. In a few days, teams will be put to hauling rock. The present indications in this mine are very favorable.

CLAREMONT HILL.—Plumas *National*, Aug. 26: On Wednesday, in company with Col. Wyatt, we made a trip to Claremont Hill. The "mine boss," Mr. Wm. Meikle, with a crew of about 17 men, is driving the tunnel and getting in timbers, etc., for the winter. The tunnel is straight as a line, and will be kept so until the gravel is reached, and is now in about 350 ft. Eight hundred feet more have to be driven to reach the channel, or, rather, this part of the channel which they intend to tap. The company certainly has good prospects for a very extensive mine, and every reason to think that good pay will be found. The former owners, Myers & Siler, drove a tunnel some 1,200 ft into the mountain, and found they were nearly 300 feet too high. Shafts from this tunnel were from 15 to 38 ft in depth, always showing blue quartz gravel, and prospecting well. The present tunnel is 60 ft lower than the Myers & Siler tunnel, and will probably be a few feet under the bottom of the channel, and about in the right place. The gravel is exactly like the quartz gravel in the Gibsonville and Sawpit Flat country, and there is no doubt but that Claremont Hill is a continuation of the channels on that side of the Middle Fork. The company has some 900 acres of ground within their lines, and a ride around it shows that much of it is channel deposit, large springs of ice-cold water breaking over the rim, with an occasional showing of gravel. We see no chance for Claremont to be a failure, and when the present tunnel is pushed to gravel, another big drift mine will commence to declare dividends and furnish work for a large number of miners.

SAN BERNARDINO.

CALICO DISTRICT.—Tombstone *Epitaph*, Aug. 25: Prof. James, of the Contention mine, returned home recently after making a hasty trip to the Calico district, California. This place is now attracting much attention from capitalists and miners, and some points on the district from Prof. James will be of interest. Mr. James is very conservative in his opinions, and was not inclined to be emphatic in any statements. He said he made a very hasty trip and was not prepared to speak advisedly. He, however, had no objection to giving his impressions of the district. The Calico district is situated about 60 miles northeast of Cajon pass, 90 miles from San Bernardino, 42 from Rodgers, on the Mohave river, and 6 miles from the Fish ponds, on the sams stream. The district covers an area of 4 miles in width by 10 in length. There are 30 locations in the district from which ore is being extracted. The quality of the ore is a rich chloride, containing haso metal and lead. Mr. James thinks very favorably of the king mine, and believes it would be well worth $1,000,000. He brought along several specimens of ore from the district, which he is now engaged in assaying. There seems to be plenty of ore in the district, but he had not remained long enough to make a thorough examination. The district is in the midst of the most barren desert he ever saw. Thorn is absolutely nothing but rocks. There is not a semblance of vegetation for miles, and, so far as looke are concerned, it is the worst country in the world. The water, however, is excellent and convenient. The branch railroad from Mohave to A. P. is completed within 10 miles of the district. There are about 300 people in the settlement, though Mr. James would not be surprised if there were several thousand within a very few months. He is also of opinion that a custom mill would be a good investment.

SHASTA.

QUARTZ MILL BURNED.—Shaster *Courier*, Aug. 26: Wednesday morning the quartz mill above French Gulch, known as the Highland mill, 10 etamps, was destroyed by fire. The woods round about the mill and house have, for some days, been on fire, but Charles Smith, who had charge of the premises, anticipated no immediate danger, and fought the flames single handed. On Tuesday night, however, the flames approached so near the mill that Mr. Smith went for assistance; but the move was made too late, the wind changing and blowing the fire in the faces of the combatants. They were obliged to retreat, leaving the mill, with a 30-horse power engine, at the mercy of the flames. It was with great difficulty that the dwelling house, a short distance from the mill, was saved. The mill and machinery had remained idle for the last few years, but the discovery of a new ledge having been recently made, preparations were being made to soon commence crushing rock. The mill was in main the property of Judge W. E. Flopping.

SIERRA.

CAL.—*Mountain Messenger*, Aug. 25: Mr. Hewson, of the Good Hope quartz mine, is having a grinding pan made at the Downieville foundry for use in his mill. He has become convinced that he is losing a large amount of rusty gold and sulphurets, which represent a large profit.

TRINITY.

PONDEROUS WORK. Trinity *Journal*, Aug. 26: The earth work on Dr. Hayes' Canyon creek ditch has been completed and a start made on the bridge for carrying the iron pipes and water across Trinity river, just below the mouth of the creek. An idea of the immensity of this latter undertaking may be formed when it is known that 30 tons of iron will be used in the structure, the first shipment of which has already arrived. With a good water supply—such as the new ditch will furnish—on the McKinney and Keno Hill mines, Dr. Hayes will unquestionably have one of the best paying gravel mining properties in the county.

TUOLUMNE.

BUCHANAN MINE. *Union Democrat*, Aug 26: John A Davis went up to the Buchanan Thursday with Mr. Alexander Moore, who will superintend future workings of the mine. The company has resolved to push ahead with energy. A vertical shaft was sunk from the old works to the depth of 102 ft, and a tunnel driven 440 ft, connecting with the shaft, the tunnel being 250 ft below the surface. A good body of ore has been developed. The mill is to be removed from its old site, and located near the tunnel, it furnishing plenty of water for battery purposes, a lack of which has always existed heretofore. The prospect is bright for this mine, which some day will be classed among the best in the county.

NEVADA.

WASHOE DISTRICT.

OPHIR. *Enterprise*, Aug. 27: On the 2200 level the joint Mexican winze has been sunk 7 ft, and the west crosscut extended 30 ft. During the week 158 tons of ore have been extracted from the croppings.

CALIFORNIA.—On the 2700 level the joint Con. Virginia drift has been advanced 13 ft. The accident at the Union shaft caused a delay in working, as it was necessary to use the C. & C. tanks for bailing purposes.

CON VIRGINIA.—On the 2350 level southeast drift No. 2 has been advanced 11 ft. On the 2700 level the joint California drift has been advanced 13 ft. The accident at the Union shaft caused a delay in working, as it became necessary to use the C. & C. tanks for bailing purposes.

UNION CON.—During the week 58 tons of ore have been extracted, and $14,112.72 in bullion have been shipped

YELLOW JACKET.—At the Winters shaft the north lateral drift on the Sagebrush level has been extended 34 ft, making the present length of same 221 ft from the switch. The ground is a mixture of quartz and porphyry. On the 2d level they have made a cross-drift on the south line, and are now making an upraise to connect with the workings of the Kentuck company for the purposes of ventilation. At the same time they are sinking for the Kentuck workings to connect with the upraise. On the 2d, 3d and 5th levels they are working in the old stopes and extracting some ore. On the surface they are employed in erecting an ore dump on the track of the Virginia & Truckee railway company.

SIERRA NEVADA. During the week 3 repair men have replanked 1,240 ft of track and placed down some drain boxes; also cleaned up the loose rock, etc., around the water-wheel and fan. Flow of water equal to 6,650,139 gallons for 24 hours.

COLUMBUS DISTRICT.

NORTHERN BELLE.—*True Fissure*, Aug. 26: Ten ft have been added to the length of the main drift on the 5th shaft level. The ground is softer and looks favorable for better progress hereafter. Crossout No. 1 has been extended 12 ft in the same decomposed quartz as last reported. A large amount of work is being done on the levels above the adit, and with favorable results. On the 8th and 9th levels the stopes look finely and continue their usual yield. The ore body has improved materially below the 9th level, and is showing a clear width of 10 ft in places and is pitching downward as the work progresses to the north. Bullion shipments amounted to $17,678 80 for the week ending August 24th, and aggregate $67,544.60 on August account to the same date.

MOUNT DIABLO.—The east drift from winze No. 1 is in 15 ft, and shows ledge matter in the face. The raise from west drift, on the 21 level, is 88 ft high, and is yielding a small amount of $100 chloride from several veins. The west drift from the Callison winze shows a few inches of $70 ore. A south crossent from the Mount Diablo adit has been extended 14 ft and shows low-grade ore in the face.

COLUMBUS CON.—The drift from shaft No. 1 to the west is in 90 ft, and is showing good ore in the face. Shaft No. 2 is down 85 ft, and it is expected that connection will be made between this shaft and the drift mentioned in about 10 days. Everything in and about the mine is running smoothly.

SUTRO TUNNEL.—Ore is still being extracted from this mine and will be shipped as fast as sacks can be secured. As the west drift progresses the vein enlarges, and the indications are that the ore body will develop much stronger in a short time.

GEN. JACKSON.—Work is still progressing on this mine, and fair advancement is being made. The development shows as favorable as anticipated, and a little more work will prove the value of the present indications.

PARDY O'NEAL.—The shaft has reached a depth of 50 ft, and the ore still holds its width and value. The tributers are elated with their prospect and will push the work as fast as possible.

EUREKA DISTRICT.

FURNACES FOR ALBION.—Eureka *Sentinel*, Aug. 22: It is decided that 2 furnaces of 40 tons capacity each will be built by the Albion company, and that they will be built at once if there is brick enough to build them, and there is plenty. Col. Robinson, superintendent, has ordered ore shipments stopped, and will put all the men in the mine to grading for the site of the works at once. Williams & Bisbee, from the Union foundry, San Francisco, will be here to-morrow week to start the building, which, Col. Robinson assures us, will be finished and ready for the reduction of ore by Sept. 24th.

LEWIS DISTRICT.

NOTES.—Lewis *Herald*, Aug. 22: The Betty O'Neal mine has made connection with the crosscut connecting with the Pierce wing, and will start stopes on ore immediately at the bottom of the shaft on the 257 level. The station is all cut and timbered, and they have started drifts both north and south and crosscut west. They are working 3-hour shifts and pushing development as fast as possible, and expect to cut the ledge in the crosscut within 40 ft. . . . . J. H. Oreen and Ed. Cozzene will sink the vertical shaft on the Nebraska mine 50 ft deeper, and then start a crosscut for the ledge. Some very fine ore was taken out of the old incline from this mine 2 years ago and worked at the old Eagle mill, giving very satisfactory results.

THE HIGHLAND CHIEF MILL.—On Saturday last the Highland Chief company's new mill started reducing ores for the Betty O'Neal company. No stoppage has occurred and every part of the mill is running in the most satisfactory manner. The mill is crushing about 1 ton to the stamp every 24 hours. The chloridizing furnace, the most important part of a quartz mill, is a perfect success. So far the chlorinations show an average of 93 to 95%. A large amount of dry amalgam is on hand, and several bars of bullion will be shipped thie week.

QUARTZ MOUNTAIN ORE.—Carruthers & Co. had several tons of good ore reduced last week in the Highland Chief's new mill. While the ore was not exceedingly rich, it showed that the Lodi mine, from which it was taken, has merit, and the owners intend pushing their developments and bringing in a large amount of ore for reduction in the Highland Chief company's mill.

EAGLE ORE. The tributers on the Eagle mine had over 5 tons of fine ore reduced in the Highland Chief mill last week. We learn that the ore yielded over $200 per ton, and the lucky tributers are happy.

MEADOW LAKE DISTRICT.

MINES BONDED.—Truckee *Republican*, Aug. 26: W. H. Ware, of Meadow Lake mining district, has bonded five 3 mines, for $60,000, to Franklin Fenney, of Philadelphia. Mr. Fenney will immediately put a large force of men at work on the mines, and add machinery and improvements. The names of the bonded mines are the Empire, Excelsior and the Pacific Ledge of the New York mine. We understand that Mr. Fenney came from the East for this purpose, and that he is acting as agent for a large mining firm. It is probable that the district is going to have another rest, and a good, substantial one. What process will be employed for the reduction of the ore we do not know, but it is not probable that people will come clear across the continent without knowing what they are undertaking. Mr. Fenney spent several days at the mines last week. He was in Truckee Monday evening, and the papers were drawn up. He went from here to San Francisco. We hope the venture will prove successful, and old Meadow Lake will boom again.

REBEL CREEK DISTRICT.

WILLOW CREEK. *Silver State*, Aug. 22: "A note from Willow Creek says times are quite lively and work is going ahead rapidly on the Silver Wave mill, which is situated about a mile and a half above the station. Twenty men are now at work on the mill, which will have a capacity of 12 tons a day, and will be used to do custom work. The building of this mill has instilled new life in the camp, and stimulated miners to prospect their claims. Many old residents of the camp, who located mines and held them by doing assessment work, are returning to Rebel Creek district. Complaint is made that there is no butcher shop in the place, and it is believed that a live butcher would do well there.

ARIZONA.

THE MILL.—Prescott *Courier*, Aug. 22. The mill on Groom creek is working away on gold rock from the Julia mine of A. J. Rubert, which is yielding well. Besides being impeded for lack of sufficient water to run full time, this mill is too small for economical or rapid work. Its capacity does not exceed 3 tons of ore per day, and the cost of milling is necessarily high. Groom creek is worthy of a good mill, having plenty of quartz, abundance of fuel and, in properly selected locations, an inexhaustible supply of water. The mill now on the creek saves only the free gold, and the silver and gold-bearing sulphurets cannot be treated. A great deal of the rock worked for gold carries over $200 per ton silver, and the sulphurets, saved in blanketed sluices and cleaned of sand by hand panning, have assayed $1,200 per ton gold. There are about 50 mining claims on Groom creek and vicinity more or less partially developed, all showing good ore. The distance to the mining camps on Lynx creek is only about 4 or 5 miles, by a good trail; and the Hassayampa, with its numerous rich mines, lies only a few miles beyond, and the locality is a good one for the erection of reduction works that would contribute largely to the prosperity of Prescott.

DOSORIS.—The good news comes from the Dosoris camp that the work on the Blue Dick mine shows a steady improvement in the size of the vein and the quality of the quartz. In the deepest working of the mine yet reached, the average width of the pay streak exceeds 4 ft, and the assay value runs high in the hundreds per ton. This mine, when a mere prospect, was sold some months since for $18,000 cash. It promises to become the banner mine. A body of ore 3 ft in width has been struck in the 100 level of the Happy Jack mine, averaging, by careful assays, $124 per ton silver. The ore is free milling and of the same character as that found on the surface. All indications point to an extensive and rich body of ore, and the erection of a mill will, without doubt, follow after further developments shall show beyond all doubt that the enterprise will pay the cost of the outlay for machinery, etc.

BIG BUG.—The recent sale of a portion of the Silver Belt mine, in Big Bug district, will soon be productive of favorable results. We hear that boiating works to bring up ore and water are to be erected very soon, and it is more than likely that suitable reduction works will also be erected. Besides the Silver Belt, the old company sold a few other promising mines. On the heels of this comes the good news that Mr. Howell and friends of his have bought the Belle mine, in Big Bug district. If so, they have secured what miners here consider a good property. The mine is pretty well prospected, so the purchasers knew what they were doing. Mr. Smith, in same locality, keeps his men at work on the Plata Bonita mine, which has a very good reputation.

MACK MORRIS.—*Silver Belt*, Aug. 22: Everything has been going along so quietly at the Mack Morris mine that we have had but little occasion to inquire about it, every week bringing along about the usual shipment of bullion—this week (the 16th) 4 bars, aggregating $5,887 61. The total shipments since the mine was opened up amount to 337 bars, of the value of $595,770.30; of this amount 130 bars, aggregating $230,443 80, have been shipped since January 1, 1882, averaging $38,725 per month. This certainly is a good showing, and the promptness with which the hands are regularly paid every month, as well as all the regular bills in our town, speaks well for the management of the company. At the mine, since the 1st of June, nothing has been done but dead work. The main shaft is going down rapidly to the 700 level. The 500 and 600 ft drifts are being pushed vigorously, and the 700 level will also be run as soon as it is reached. The indications are that the great body of ore is trending downwards, and the prospects for a good output from the 500 to the 700 are very encouraging. It is the intention of the company to go on sinking the main shaft without delay down to 1,000 ft, as everything indicates that the richest part of the mine is below the 600 level. While all this development work has been going on there has been but little ore extracted. The mill has been running on tailings for the last three months, and the assay of the tailings now running to waste from the mill is very little over $7, and this would never pay to save. The mill has been put in first-rate order and everything is in good condition. The La Plata mine, which adjoins the Mack Morris, and belongs to the same parties, is now to be thoroughly opened. A shaft will at once be sunk to 500 ft, and the levels regularly opened, so that the mine may be thoroughly proved.

COLORADO.

PELICAN-DIVES.—*Miner*, Aug. 22: A new strike was made on Friday of last week in the Pelican-Dives mine, between the 22 and the McSweeney levels, 340 ft from the surface. Eight inches of 500-ounce ore is the result.

BISMARK LODE. This lode is located on Brown mountain, and is being worked by 4 men at present, who are doing development work which is more than paying expenses. The mine is being worked through a crosscut tunnel which is 175 ft in length. The drifting from this point is 175 ft east. After drifting 75 ft east they struck pay ore which has already continued 100 ft, and shows 4 inches of first-class ore in the heading, besides about 2 ft of concentrating ore. The average of the mill runs of ore has been 200 ounces. Four men have taken out 82 000 since last November. The vein is 12 ft wide.

THE JOE REYNOLDS LODES.—The Joe Reynolds lodes, Nos. 1, 2, 3 and 4, which are situated on Columbian mountain, have been extensively worked. The developments consist of a crosscut tunnel 200 ft long, which cuts the vein about 150 ft from the surface. A drift has been run on the vein, which is called the O'Connel level, 800 ft in length. About one-third of this level has been stoped out to the next level above, which is called the Daily level, and has produced more than $200,000. It is 65 ft between the levels. The Daily level is 750 ft long, and has already produced $140,000. Only 150 ft on this level has been stoped out. The discovery level is 530 ft long. About 60 ft has been stoped out. This level has produced about $35,000.

ORE.—Georgetown *Courier*, Aug. 24: John McLees brought down some fine pieces of very rich ore from the Josie Meeker mine, below mountain, last week. . . . . A rich strike has recently been made on the south side of Gray's peak, the particulars of which have not yet been made public. . . . . Capt. Kennedy has a good-looking claim back of his house on Burrell hill, and almost within the limits of the town. His ore vein is small, but the lots he has taken out have milled 173 ounces, 231 ounces and 615 ounces of silver per ton.

SMELTING WORKS.—Henry Shadboldt came in from Decatur yesterday, and reports the new smelting works at that place well under way. The process is a new one, owned by George Rust & Co., of Denver, who are building the works. Their office is completed; their large boarding house is closed in; the grading for the mill is completed; the machinery has been shipped; there are 25 men now at work on the building, and it is the calculation of the owners to have everything ready to fire up by the 1st of November.

UNICORN.—A vein of 600-ounce ore, about 8 inches thick, was struck last week in the Unicorn lode, of the Pelican & Dives company, in the stope over the 2d tunnel level, in Hooper & Co.'s lease. The company, at present, is working about 100 men, mostly lessees, and next month expects to increase the force, as it is said. Duff's intention to start 3 new levels on the Unicorn.

BANCROFT-CARTER MILL. We paid a visit last week to the new Bancroft-Carter mill, at North Empire, and found everything working very nicely. The mill is treating ore at a cost of $3 per ton, and unquestionably is doing good work. Its capacity is 8 tons in 24 hours, and if it was increased four-fold we can see no reason why ore cannot be treated at a cost of $3 to $3.50 per ton.

IDAHO.

NEW STRIKE AT SAWTOOTH.—Ketchum *Keystone*, Aug. 22: District Clerk A. L. Richardson came down yesterday from Sawtooth, and reports an important strike in the Cone', in Eureka gulch, about 5 miles from Sawtooth. The new vein is 6 ft in width, and is free-milling ore, which assays from 80 to 570 ounces. The Comet is owned by A. L. Richardson and Wm. Bair, of Boise City, and S. W. Wooster.

WEST FORK AND ERWIN.—Thirty-four men are employed on the West Fork and Erwin claims, of the Philadelphia Co. on the former and 14 on the latter—both of which look well and are yielding daily shipments to their smelter near town. The roads leading to these mines are in good condition, and shipments will continue until snow flies. From these, the Elkhorn, and other mines the smelter is abundantly supplied for its full run.

ONTARIO DEVELOPMENTS.—Operations on this mine have for some time past been confined exclusively to developments. A crew of 17 men, working in and about the upper main tunnel, has extended it into the hill upwards of 250 ft, everywhere accompanied by a perfect and continuous vein, with an average width of 3 ft and an assay value of 100 ounces. The character of the ore is a clear, easy-smelting galena, which is being shipped to the Salt Lake refining works in such quantities as lie in the way of developments.

THE GERMANIA.—The Germania mine, owned by Bonanza parties, on the East Fork of the Salmon, is well developed and looking splendid. It has been operated for two years, and is now producing a minimum of 10 tons daily of ore having an average assay value of 150 ounces. The only outlet to this, and other mines in that vicinity, is through the Wood River country, and the proprietors of the Germania have completed arrangements with the Senate Co., of Galena, for the reduction of their ores. Shipments will commence across the divide as soon as teams can be obtained, and will continue to the Senate smelter until snow flies.

CARRIE LEONARD SHIPMENTS.—We are informed by proprietors of this claim that ore shipments will be made to this place on pack animals in a few days, and continue during the season. Where the grade of ore is but little above the average of the country, and the situation is inaccessible by wagon roads, such steps as these certainly show an industrious spirit on the part of owners. The Carrie Leonard is developed by a 150-ft tunnel, the breast of which is 150 ft below the surface, and the work shows a steady and continuous vein, averaging in width 3 ft, with an assay value running up to 130 ounces, which is the grade of the shipping ore.

BIG SMOKY.—Vienna *Reporter*, Aug. 22: Fifty or 60 men are busily engaged doing assessment work and developing the mines on Big Smoky. All of the prospects, and there are many, are looking fine, and a large number of them promise to be bonanzas of great wealth. The mineral belt is of great length and breadth, and the name "Big Smoky" will soon be as familiar to the ears of the mining world as Wood River or this district. The mines are so situated that a good wagon road can easily be put in from here, and timber and water convenient. The ledges are undoubtedly continuations of those in this district, but run into galena after crossing the divide, where the formation changes to slate. We are glad to see the owners of prospects at work developing them, as by proper development only are they made saleable.

WORK is progressing vigorously on the Mountain King, from which ore filled with black sulphurets, ruby and horn silver is being extracted. None, however, is taken out other than while is necessary in opening up the lower levels of the mine. It will average pay up into the hundreds of ounces per ton, and the vein is of extraordinary richness. It is one of the best of Idaho's mines, as will be demonstrated when the mill commences crushing.

MONTANA.

PARK CANYON.—Butte *Miner*, Aug. 22: Some time since the Parrott Co. bonded the Rosa mine, in Park canyon, for 50 days. The shaft is down 12 ft and the rock very hard blasting. The vein shows considerable native copper, though the seam is very narrow. There are two veins, and it is reported a shaft will be sunk between them and crosscuts advanced for the vein. There is already much excitement in the neighborhood, and, as a consequence, several claims have lately been jumped. On the New Emerald prospecting for the vein continues.

NEW MEXICO.

SHUT DOWN. *New Mexican Mining News*, Aug. 24. Work has been shut down in the Marshall Bonanza mine. It is rumored that the property is about to change hands. . . . . The San Pedro property in Santa Fe county is paying well. The expenses have been reduced under the management of Mr. Magee, and the stamp mill is running successfully. . . . . New placer miners are very much elated at the state of their case against the San Pedro & Canyon del Agua company. . . . . Richard Helen has a copper prospect in Coyote canyon. The ore is exceedingly rich. . . . . The Val Verde mining company will employ 5 teams in hauling copper ore from their mines to Deming, to be shipped to Socorro. . . . . There is an abundance of fire clay in the Caballo mountains. . . . . Martin Joyce owns the Galena Wave, a 24c vein of quartz and galena, in the Magdalena mountains.

OREGON.

NOTES.—Jacksonville *Times*, Aug. 26: N. McNair will be in charge of Howard & Simmons' mines, at Gallce creek, next winter. . . . . Gin Lin is still piping, but not regularly, as water is light. He has done well this season. . . . . Fred. Otten, of Foots creek, was in town this week. He is engaged in opening a new drifting claim. . . . . Jacob Klippel and Wm. Brolbeck have taken charge of the Squaw creek mines and will put them in shape at once. . . . . Miller & Kretzer's hydraulic pipe, of which there is about 2,000 ft, arrived this week, and will be put together at once. . . . . Cleaning bedrock is still going on at the Sterling mine, and will continue about 6 weeks longer. Very satisfactory results are promised. . . . . Martin Mackey, Josephine county, sent us a piece of iron ore last week, which seems to be rich in that metal. He has a large ledge of it.

The Lumber Interest of the United States.

We have just received from Prof. C. S. Sargent, special agent of the U. S. Census Office for the preparation of a report on the forests and lumber interests of the country, an advance copy of his table setting forth the results of investigation of the lumbering industry. The table shows the magnitude of the business. The aggregate value of the products, $233,367,729 in a single year, is startling to those unacquainted with the subject. It is shown that the aggregate amount of capital invested in lumbering is $181,186,122, and that something like 150,000 men are employed. The following table, which we prepare from the fuller data presented by Prof. Sargent, gives the amount of lumber produced and the value thereof, and shows the comparative rank of each State in the business:

States and Territories.	Number of Establishments.	Feet of lumber (board measure).	Total value of all products.	Rank according to value of products.
United States..	25,703	18,091,356,000	$233,367,720	
Alabama.....	354	251,851,000	2,649 634	23

West Virginia..	472	180,112,000	2 431,857	24
Wisconsin	704	1,542,021,000	17,952 347	3
Wyoming.....	7	2 960.000	40.090	47

In addition to the lumber noted in the table the following minor products are noted:

	Number of laths.	Number of Shingles.	Number of Staves.
United States....	1,761,788.000	5,555,046,000	1,248,226,000
California.....	2 420.000	138,718,000	2,063,000
Oregon.....	18 245,000	5,040,000	.....
Washington Ter..	6,550,000	3,610,000	23,666,000
Nevada.....	.....	435 000	.....
Arizona.....	150,000	1,760,000	300,000

We have selected only the Pacific States and Territories in the above enumeration of minor products.

The final publication of the Census Office on the lumber interest will be a grand volume. It will contain a map of each State and Territory, colored to show the area occupied by each of the leading forest trees, with statistics of the amount of each still standing, and will probably be the most noted publication on forest resources, etc., ever made in the world.

Mining Invention—A Knuckle-Joint Drill.

Miners and others engaged in blasting have long felt the need of some tools by which drill holes could be chambered out at the bottom, so as to secure good and certain execution from blasts. It frequently happens that charges placed in straight-drilled holes were blown out without performing the desired work. To obviate this difficulty, an invention, known as the knuckle drill, has recently been patented. W. H. Randall, one of the patentees, has been in Nevada City for several days past exhibiting the drill to mining men. At Washington, last Sunday, a practical test of it was made in the presence of a large number of experienced miners and others. A one-inch hole was drilled in a hard howlder, after which the knuckle drill was inserted, and in three minutes' time by the watch, the bottom of the hole was enlarged three inches in size. In order to prove the work of the tool, the howlder was split open and the cavity measured. This was done in a hard granite howlder, and by hand power. The drills can be worked by single, double-hand or steam power. They have been thoroughly tested at Leadville, Colorado, and pronounced a complete success. Parties here who have examined the new tool and the work it does consider it a most valuable invention for the mining sections, and one that will doubtless soon come into general use in the mines throughout the world. The drill is so constructed that the lower portion of it works upon a knuckle joint, which gives it the motion required to ream out or chamber the bottom of the hole.—*Herald.*

Igneous Meteors.

Observations on meteors, or shooting stars, reported by our readers last week, lead us to present some facts about these interesting bodies, accompanied by an engraving of a notable meteoric display like those which occasionally appear and fill the beholders with awe and admiration.

It is reported that on Wednesday night, August 9th, about 9 P. M., a remarkably brilliant meteor was observed by some of the guests at Highland springs, traversing the heavens in the near west. Its motion appeared exactly in a horizontal line and exceedingly rapid, leaving a brilliant and, as it were, a perfect line of fire in its track through the atmosphere. An unusual number of falling stars were also quite noticeable in the remarkably clear atmosphere of that region.

There are meteors of several kinds. The whirlwind and the tornado are termed aerial meteors; fogs, rain, snow, etc., are called aqueous meteors; rainbows, halos, etc., are luminous meteors, and lightning, auroras, etc., are electrical meteors. The bodies which are commonly called meteors are igneous meteors, and comprise shooting stars, aerolites, meteorites, etc. It is of the last class of meteors of which we would speak at this time.

DISPLAY OF IGNEOUS METEORS OR FALLING STARS.

Igneous meteors may be seen on any clear night, if one will watch patiently for them; but at stated times of the year they always occur in unusual numbers and brilliancy. One of these times is during the second week of August—generally about August 10th. They radiate from the constellation Perseus, which is adjacent to the Polar star. Another meteoric period is the second week in November of each year—generally from November 12th to 14th.

It has been determined that these meteors are not seen higher than about 100 miles from the earth's surface, nor nearer than 30 miles. The meteors and their trains have various colors—white, green, blue, scarlet, etc. The duration of the flight of a meteor is generally about one second, but the brighter ones may last several seconds. Sometimes a shooting star leaves behind it a cloud of phosphorescent light, sometimes of short duration, but sometimes visible for minutes, and rare cases have been reported in which the light remained an hour.

Meteors move with a velocity of from 8 to 40 miles per second, the average speed being about 30 miles, or 100 times that of a cannon ball. All the smaller meteors have a solid substance, sometimes of stony composition, sometimes of iron. Concerning the origin of meteors, Mr. Newton, in an article in *Johnson's Cyclopœdia*, says: We may regard the meteoroid as a small solid body describing its long elliptic orbit about the sun, like any comet. The number of such small bodies is so great that every day many millions of them come within 4,000 miles of the earth's center, the number being but little increased by the earth's attraction. They are entirely invisible until, at a hight of less than 100 miles from the ground, they enter air dense enough to resist their motion and create light. The air being compressible, an intense heat is developed directly in front of the body. The anterior surface is, in consequence, melted away, the melted matter being wiped off by the air. This streams back, forming in part the apparent flame and the train of the meteor. Its own firmer constitution prevents the meteorite from like condensation and internal heating, and it therefore proceeds many miles before it is entirely destroyed. Under favorable circumstances of velocity, chemical and mechanical constitution and size, the meteoroid is not entirely scattered, but, breaking up into fragments, comes to the ground in a shower of stones. These stones often show traces of the flow of melted matter, also evidences of successive fractures, and even the partially developed cracks which, with further action, would have become fractures. But for this action of the air in arresting and destroying the meteoroids, we should be intolerably pelted with them. The meteorites are all evidently fragments, not separate formations. They are in the heavens, to some extent at least, grouped in streams along the orbits of known comets, and hence have some common origin with them. The continuity of these streams, the double and multiple character of Biela's and other comets, and the steady diminution of comets in brilliancy at successive returns, seem to argue a continuous breaking up of the comet into fragments by some cause—probably by the sun's heat.

Acid Stains.—These may generally be known by reddening black, brown and violet dyes, and all blue colors except Prussian blue and indigo. Yellow colors are generally rendered paler, except the color of annato, which becomes orange. These stains are neutralized by alkalies. A spot, for instance, on a woolen coat, from strong vinegar or sulphuric acid, may be entirely removed by applying a solution of saleratus. Apply it cautiously until the acid is exactly neutralized, which may be known by the restoration of color; and then sponge off the salt thus made by means of a sponge. Ammonia is better for delicate fabrics. Sweet stains are usually occasioned by a little muriate of soda and acetic acid, which produce nearly the same effects as acids generally, and are to be removed in the same way, operating cautiously.—*Growantemn Telegraph.*

Pacific Borax Works.

Recently the new Pacific Borax Works, at Fish Lake valley, were opened with a grand party. Some five carriage-loads of Candelarians were in attendance, and the people thronged in from all sections. There was a splendid collation on the occasion, dancing and, in the evening, a fine display of fireworks. The Candelaria *True Fissure* contains a lengthy account of the affair.

Borax Making

Is, however, that which will most interest persons at a distance. The brothers, F. M. and J. P. Smith, are the proprietors of the works and the borax marsh. There are several large buildings, sheds, platforms, etc., with steam engines and other machinery. The *True Fissure* says of the process of manufacture: The site selected for the works is on the western side of the marsh, and under the side of the hill, high enough to allow a grade sufficient for the handling of the solution from the time the crude borax is first landed on the dump. The crude is shoveled up into winrows on the marsh and allowed to remain for a time, that the moisture might leave it, decreasing the weight to the matter of hauling. It is then loaded into a wagon and taken to the dump.

The side of the hill has been excavated for the building of a stone wall, done in mason work, which is about 15 ft. high and 150 ft. long. The dump has an easy approach from two sides, and is level enough on the top for the easy handling of all the material taken there. A new building covers the boiler and pumping-room, in which is a tubular boiler 16 ft. in length and 54 inches in diameter. There are two steam pumps in position, one of which has a six-inch cylinder, and is used for the purpose of pumping water from the well for washing the tanks and sprinkling, as well as fire purposes. This well is 22x12 ft. in size and 18 ft. deep. The other pump has a four-inch cylinder, and is used for feeding the boiler and for conveying water to crystallizers. An immense network of steam pipes, of sizes varying from half an inch to four inches in diameter, runs about the pumps and boiler to the dissolving tanks. It is estimated that about 1,500 ft. of steam pipe have been put into the places required. Right under the stone wall are six immense iron dissolving tanks, each of which is nine feet in diameter by seven in depth. The tops of these are covered with a platform made of two-inch plank, in which openings are made for filling the tanks. A system of steam pipe extends all over the bottom of each tank, and about every four inches the pipe is perforated for the escape of steam. A quantity of the crude borax is dumped into one or more of the tanks, and about three feet of water added. This fills the tank to within two feet of the top, when the steam is turned on and the mixture receives a thorough boiling.

The Crystallizers.

It is then allowed to settle 10 or 12 hours, and is then drawn off from the top of the solution by a syphon into the crystallizer, located on a platform about 30 ft. below. There are 45 crystallizers now in use, and more will be added when necessary. Each of these is lined with galvanized iron, upon the surface of which the borax precipitates itself and is easily removed. The solution remaining in the dissolving tanks is then given a second boiling and drawn off again, as above described. The mud and remainder of the borax is then turned into a system of mud tanks, which occupy a position immediately below the first line of tanks, and if found to contain a large enough percentage of borax it is shoveled into a car and run along a track to a Hinckley elevator, which lands it on the top again, whence it goes into the dissolving tanks. After the crude borax has been worked over and over, until but little remains, the tailings are removed to a reservoir made in the ground, just below the last line of crystallizers.

This reservoir is 50 ft. square, and two and one-half feet deep, and here the tailings are allowed to remain and undergo the natural changes, the same as when first taken from the marsh. Car tracks run between the lines of mud and the crystallizing tanks, and into the drying and storage building. This building is 64 ft. long by 24 in width on the ground floor, and is intended for storing and drying. A second story has been added to it, which runs the entire length, but is only half as wide. In this are placed the superintendent's office and a sleeping-room for the employes, of whom there will be about 20 when everything is in full operation. There is a good-sized boarding-house and blacksmith shop close at hand, and a corral 100 ft. square has been built near by, with a good-sized barn within the inclosure. It is calculated that there will be 40 to 50 tons of borax manufactured per month. This has a market value of $200 per ton, from which it can easily be estimated that the institution involves a financial proposition of no small proportions.

Minerals in the Stomach.—A curious result of the use of bismuth as a medicine has just been noticed in a hospital in Modena. A deep fissure was observed along the greater curvature of the stomach, which was filled with a gray, semi-solid mass. On examination it was found to be oxide of bismuth, agglutinated together with mucus. As the patient had taken no bismuth for some time, she must have carried it for several weeks, at least.

Colorado School of Mines.

The following well-written article on the status of the State School of Mines, Golden, is reproduced from the San Juan *Prospector*:

As the mining camps are now opening up, attention is again being forcibly drawn to our mining school at Golden. The students of the Colorado State School of Mines are to be met with in this region quite extensively, for with the few months spent at Golden under the guidance of the professor in charge, they have located in the various mining regions to assay and survey. The great need of this State, and of any of the mining States, is an institution which is well provided to fit men for the wants of the State. Unquestionably the fundamental industry of this State is mining, although agriculture is gradually assuming important proportions among the industries of the nation. The Legislatures of previous years have clearly recognized this fact, and, in 1879 there was established the Territorial School of Mines. Succeeding Legislatures have made liberal provisions for the school, until, at the present time, the Colorado State School of Mines stands equal, if not superior, to any institution of the kind west of the Alleghany mountains. Colorado may well be proud of its small cost to the community.

Not only do youth contemplating making mining, civil engineering or metallurgy their calling in life come for the information which must otherwise be acquired abroad or away East, but hundreds of men in the prime of life, actively engaged in work, take advantage of the opportunities afforded to gain information upon special points. The average age of the students has not been far from 30 years. The results are, without doubt, noticeable throughout the State. With the theoretical and practical knowledge, they are not only securing financial success for themselves, but also raising the standard of the industry they represent, and giving success to the companies employing them.

In 1882, a new building was put up for the accommodation of laboratories and lecture rooms, but notwithstanding its proportions, the trustees have been compelled to add to it, and have no doubt by the present time awarded the contract for the addition of another building. When completed, the capacity will then be tripled, and accommodations for perhaps 200 students will thus be had. The increasing popularity and rapid growth has been such that the faculty will also, in all probability, be increased, as it is imperative. The number of students last year was 61, while during the present scholastic year just closed, it was 94.

There are three regular courses of instruction—metallurgy, mining and civil engineering—to complete any one of which requires four years. Graduates of other institutions may omit taking any such studies as they have previously passed through. Special courses of a few months can also be entered upon in assaying, geology, mineralogy or surveying. All students receive individual instruction in these branches. An ample supply of furnaces, minerals and surveying instruments is in the cabinet of the school, and a large amount of practical work in surveying and geology is daily done.

The location of the school cannot be surpassed. Golden, 16 miles from Denver, on the C. C. R. R., has three large smelters, coal mines, and many manufactories of various kinds within its town limits. The mining and milling regions of Bowlder, Central and Georgetown are close at hand. The geology of the foothills and the Rocky mountains is well represented in its immediate vicinity, and weekly visits under Prof. Lakes are made to the mountains, thus familiarizing the student practically with the rocks and fossils of the State.

The year just closed has shown the school to be very popular, since, of the 94 students registered, 11 are from the Eastern States. Seventeen counties of the State are represented, showing that the school is not a Jefferson county institution. There were 13 graduates of other institutions, including Naval Academy, Columbia College and Freiberg.

The expenses are very light. Tuition is free, being provided for by the State. A charge of $20 is, however, made for apparatus and breakage, and it is thought wise that a charge of three dollars be made for the use of surveying instruments. The expense for books need not be large. Rooms can be obtained for seven dollars a month, and excellent board for five dollars per week.

Another advantage, of which the public may avail itself, is the information upon treatment, assay and value of economic products. It will, therefore, be seen how important is the position held by the Colorado State School of Mines, in its bearing upon the leading industry of the State. It is, therefore, hoped that those interested in mining, or the advancement of the school, will profit by the advantages offered them, while those desiring further information may write for a catalogue. The next term begins September 27th, although students will be received at any time after that date.

Since the foregoing article was written, the contract for the new building has been awarded to Mr. George H. Kimball, and the work of excavating is already completed. The stonework was commenced last Monday, and will be completed within three or four weeks.

The whole building will be inclosed by the middle or last of September, and ready for the fall term, which begins Sept. 27th.

The outlook is very favorable for a large attendance during the next school year.

Useful Information.

Tin Roofs.

A tin roof properly put on and kept properly painted will last about 30 years. A tin roof ought not to be painted for the first time until it has been on about 30 days, so as to get the grease off the tin, and all the rosin should be carefully scraped off.

It is sometimes necessary on buildings where there is much dampness or steam, as stables, blacksmith shops, round-houses, etc., to paint the tin one coat on the under side before laying. After the roof has been painted the first coat, it should be painted again in about a year, and after that, once in three years is enough.

There are two kinds of tin; one, the coating of which is all tin—that is, the tin proper, sometimes called "bright tin;" the other, the coating of which is a composition, part tin and part lead; this is called "tern," "leaded," or "roofing" tin. This last is a little cheaper than the "bright," and will not rust any quicker, but we think, as do many others, that the sulphur in our soft-coal smoke eats through the "leaded" coating sooner than through the "tinned."

Of tin there are two sizes, 10"x14" and 14"x 20", and two grades as to thickness, IC the light, and IX the heavy.

For a steep roof, one-sixth pitch or over, the IC, 14"x20" tin ("leaded," if high up where little smoke will get to it; "bright," if low down where much smoke will get to it), put on with a standing groove, and with the cross seams put together with a double lock, makes as good a roof as can be made.

For flat roofs, the best roof is made with the IX, 10"x14", "bright" tin, laid with cleats; but the others make good roofs, and any of them will last for 25 years at least.

All tin roofs should be laid with cleats, and not by driving the nails through the tin itself.

The Crosscut Saw.—Ten years' experience in the use of crosscut saws has proved to me that I have been working under many disadvantages until recently. My wish is for all to know the great advantages of a plan which I pursue. Take a new saw that has never been set, place it between two boards cut to fit the saw, clamp it tight on a bench or vice; take an iron wedge, file one corner to suit the set of the teeth when finished, then take a small hammer, hold the wedges with the left hand, strike the tooth lightly with the hammer until at the right place; then turn the wedge on the opposite side, and on the next tooth, and set in the same way; now, then, you reach the third and most important tooth in the saw; leave it perfectly straight; pass on to the fourth tooth and set as you did the first; turn the wedge, set the fifth the other way; leave the sixth straight, and so on till you finish. Now take your file, dress the two teeth as you do the common saw; the third file perfectly straight and square, leaving it about one-twentieth part of an inch shorter than the others. Continue in that way till you finish, and you will find that it will cut twice as fast as the old way practiced by most of the farmers.—*Southern Cultivator.*

Inventor Edison and his new electric light company are threatened with being brought to grief by a young man named Freeman, of Racine, Wisconsin, who claims to be the inventor of the incandescent light, and will prove in the courts that Edison incontinently appropriated the whole thing. Freeman is also supported by a powerful company, and the twain are about to try conclusions. The plaintiffs will show that Freeman was the first to accomplish the wonder of incandescent light by means of a vacuum, which he exhibited to a considerable number of people a year prior to the time when Edison brought out his discovery; also, that Freeman sent one of his lamps to Edison for inspection, and that the latter immediately usurped the entire invention and procured patents thereon. Both parties have retained the ablest patent lawyers to be had for money, and a famous legal contest is in course of preparation.

To remove paint from old doors, etc., and to soften putty in window frames, so that the glass may be taken out without breakage or cutting, take one pound of American pearl ash, three pounds of quick-stone lime; slack the lime in water, then add the pearl ash, and make the whole about the consistence of paint. Apply it to both sides of the glass, and let it remain for 12 hours, when the putty will be so softened that the glass may be taken out of the frame without being cut, and with the greatest facility. To destroy paint, lay the above over the whole body of the work which is required to be cleaned, with an old brush (as it will spoil a new one); let it remain for 12 or 14 hours, when the paint can be easily scraped off.

Copper-plating Sheet Iron.—A firm at Geisslingen, Germany, is said to be using a novel method for copper-plating sheet iron. The sheets are thoroughly cleaned and pickled, and sheet-copper similarly treated is laid on top of them, the edges of the latter being folded over the edges of the former with care, and chalk being plastered under the copper turned over to prevent it from welding. The sheets are then put into a muffle and heated nearly to a white temperature. They are passed through rolls three or four times, thus welding them together.

A Big Emery Wheel.—Some months ago the Tanite Co. received an order from one of the foreign governments for a solid emery wheel, 36 inches in diameter and eight inches in thickness. A wheel of this size weighs about 800 lbs., and its list price is $500. A few weeks since the company received a cable order from their Liverpool house for a special machine on which to run this immense wheel. They are now constructing this machine, which is the largest they have yet built. It is from an entirely new design, and will weigh, when complete, 2,200 lbs. The company received last week an additional order from the same government for nearly $3,000 worth of solid emery wheels. Notwithstanding the recent enlargement of their works and increase of hands, they are kept busier than ever.

Spontaneous Combustion of Cotton.—During one of the hot days of June, a Connecticut lady thought she smelled something burning upstairs. In searching for the fire she entered a small, close garret room used for storage. She opened a window and instantly a bag of carpet rags hanging there burst into flame. The rags had been hanging there all winter. The fire was promptly smothered, and when the bag was opened, it was found that only balls of cotton rags were burned. Whether the rags had been dyed is not stated.

Rawhide Horseshoes are made and used in England, but to no great extent. Three thicknesses of green hide are said to be compressed into a steel mold and then subjected to a chemical process. It is said one of these shoes weighs but one-fourth as much, and will wear longer than an iron shoe.

It is asserted that articles of iron or brass may be bronzed by dipping them into melted sulphur mixed with lamp-black. The surface, after being drained off, will take a beautiful polish, and presents the appearance of oxidized bronze.

A welding powder named antimonoid has been in use for some time past in Germany, and found to be of great efficiency. It consists of four parts of iron turnings, three parts of borax, two parts of borate of iron, and one of water.

Copper Prospects.

The prospects of Tucson becoming the chief shipping point in Arizona for copper bullion are very promising. Silver Bell, the Old Hat and the Santa Rita copper mines are all tributary to Tucson. There are already four smelters in operation, and two more are being constructed, and the mines are looking better than ever before.

Copper mining in Arizona is in its infancy, and our mining men have much to learn about the business. They have already learned one very important fact in relation to copper mines in Arizona. It is that, in almost every instance, the mines improve upon development. Copper that assays only two and one-half per cent. is now worked at a profit in Nevada, which shows the perfection that has already been reached in the reduction of copper ores. We venture to assert that there is not a copper mine in this section of Arizona but that may be made to pay. Every prospector who has a copper mine should attempt to develop it, for he can rest assured that it will bring money in the near future. There is another thing about copper mining which has generally been overlooked, and that is the permanency of copper mines. Copper mining has been successfully carried on in England for nearly two centuries, notwithstanding the ore was of low grade and many of the lodes were small, irregular and much broken up. The copper mines in Spain, which are also of low grade—from two to two and a half per cent.—have been worked for centuries, and have enriched every company that has operated them.—*Arizona Citizen.*

Standing and Sitting.—The London *Daily Telegraph* says: "Nature, while she specially built the human form to stand erect, has specially decreed that men and women should occasionally rest themselves by assuming a sedentary position. Almost every medical authority on the deformities of the human body has drawn attention to the fact that standing too long operates in a vicious direction, which, by elongating certain muscles, weakens them; that from the necessity of changing position, in order to rest the muscles, it occurs that when people are standing they alternately balance themselves first on one leg and then on the other, but most frequently on the left; and that a girl with a weak spine, after standing upright for some time, generally does not keep her feet in line, but places one above the other. Curvature of the spine, albeit temporary, is the result. The habit of standing on one leg, a habit almost unavoidable in standing too long, induces the shoulders to lose their horizontal level. The one opposite to the projecting hip becomes higher than the other, and the spine becomes deformed laterally at this part."

Near the end of last month snow appeared in the English channel off the coast of Kent. A steamer on her way from Hamburg to Havre passed into and through a veritable snow-storm there, about 10 o'clock in the morning. It remained 10 minutes in the storm. The ship was 20 miles out to sea.

Good Health.

The Proper Time for Work.

The habit of writing and reading late in the day and far into the night, "for the sake of quiet," is one of the most mischievous to which a man of mind can addict himself. The feeling of tranquillity which comes over the busy and active man about 10:30 or 11 o'clock ought not to be regarded as an incentive to work. It is, in fact, the effect of a lowering of vitality consequent on the exhaustion of the physical sense. Nature wants and calls for physiological rest. Instead of complying with her reasonable demand, the night worker hails the "feeling" of mental quiescence, mistakes it for clearness and acuteness, and whips the jaded organism with the will until it goes on working. What is the result? Immediately the accomplishment of a task fairly well, but not half so well as if it had been performed with the vigor of a refreshed brain working in health from proper sleep. Remotely, or later on, comes the penalty to be paid for unnatural exertion—that is, energy wrung from exhausted or weary nerve centers under pressure. This penalty takes the form of nervousness, perhaps sleeplessness, almost certainly some loss or depreciation of function of one or more of the great organs concerned in nutrition. To relieve these maladies—springing from this unexpected cause—the brain worker very likely has recourse to the use of stimulants, possibly alcoholic, or it may be simply tea or coffee. The sequel need not be followed. Night work during student life and in after years is the fruitful cause of much unexplained, though by no means inexplicable, sufferings, for which it is difficult, if not impossible, to find a remedy. Surely morning is the time for work, when the whole body is rested, the brain relieved from its tension, and mind power at its best.—*Manufacturer and Builder.*

Vinegar for the Sick Room.—There is a French legend connected with the preparation called *vinaigre a quatre voleurs*. During the plague at Marseillee a band of robbers plundered the dying and the dead without injury to themselves. They were imprisoned, tried and condemned to die, but were pardoned on condition of disclosing the secret whereby they could ransack houses infected with the terrible scourge. They gave the following recipe, which makes a delicious and refreshing wash for the sick room: Take of rosemary, wormwood, lavender, rue, sage and mint a large handful of each. Place in a stone jar, and turn over it one gallon of strong cider vinegar; cover closely, and keep near the fire for four days; then strain, and add one ounce of powdered camphor gum. Bottle and keep tightly corked. It is very aromatic, cooling and refreshing in the sick room, and is of great value to nurses—*N. Y. Tribune.*

Dogs a Cure for Consumption.—The Elmira, New York, *Gazette* is responsible for the following, for which it vouches. The party is a well-known business man whose name could be given if desired: A prominent citizen of Geneseo has been prolonging his own life at the expense of sundry dogs. Some two or three years ago, the gentleman, who was pronounced by his physicians in an advanced state of consumption, began the habit of taking his pet dog to bed with him. The dog soon exhibited unmistakable signs of lung disease, coughed incessantly, and finally died. Another was procured, which went the same way, and the gentleman has now a third one for a bedfellow, who, at the time the article was written, gave every indication that he would soon follow in the way of his predecessors, while the man is better than he has been for years. So much for dogs and consumption.

Fasting in Acute Rheumatism.—Dr. Wood, professor of chemistry in the Medical Department of Bishop's College, Montreal, reports, in the *Canada Medical Record*, a number of cases in which acute articular rheumatism was cured by fasting, usually from four to eight days. In no case was it necessary to fast more than ten days. Less positive results were obtained in cases of chronic rheumatism. The patients were allowed to drink freely of cold water, or lemonade in moderate quantities if they preferred. No medicines were given. Dr. Wood says that from the quick and almost invariably good results obtained by simple abstinence from food in more than 40 cases in his own practice, he is inclined to believe that rheumatism is, after all, only a phase of indigestion, to be cured by giving complete and continued rest to all the viscera.

Epilepsy and Food.—Epileptics are, as a rule, enormous eaters. We have known a boy with this disease eat twice as much as was really necessary for his support. It is very difficult to prevent this, as they had about as soon die as not to gratify their appetites. Now, what is the result of this overeating? The stomach is taxed to its utmost to digest the food, and the powers of excretion are also gravely overtaxed. The blood becomes overloaded with urea, carbonic acid, bile and other excrementitious matters, and all these things bring on attacks of the disease much oftener than they would otherwise occur. The epileptic should therefore eat less.—*Herald of Health.*

TABLE OF CONTENTS.

GENERAL EDITORIALS.—A New Water Pressure Gauge; Rich California Mines; National Industrial Convention; The Prospectors, 145. Passing Events; Tin; The Blatchly Concentrator, 152. The Denver Exposition, No. 3, 152-53-56. The Golden Gate Fair; Patents and Inventions; Notices of Recent Patents, 156.

ILLUSTRATIONS—A New Water Pressure Gauge; On a Prospect, 145. The Blatchly Concentrator, 153.

MECHANICAL PROGRESS.—Notes on Water; A New Electrical Invention; The Steam Street-Car Problem; Nickel-Plating by Boiling; Expansion of Metals on Cooling from Fusion; To Avoid Rust; Iron that Resists Acids, 147.

SCIENTIFIC PROGRESS.—Artificial Quinine; How Coal is Formed—Some New Ideas; A Rival for Sugar, Possibly; To Condense Moisture in the Air; The Horse in Early Times; The Darwinian Creed; Mellogen; Artificial Metallic Caesium; Telegraphing and Telephoning Simultaneously over the Same Wire; Converting a Negative into a Positive; The Action of Light on Oxygen; Tungsten in Magnets, 147.

MINING STOCK MARKET.—Sales at the San Francisco Stock Board, Notices of Assessments, Meetings and Dividends, 148.

MINING SUMMARY from the various counties of California, Nevada, Arizona, Colorado, Idaho, Montana, Oregon and New Mexico, 148-9.

USEFUL INFORMATION.—Tin Roofs; The Crosscut Saw; Copper-Plating Sheet Iron; A Big Emery Wheel; Spontaneous Combustion of Coal, 151.

GOOD HEALTH.—The Proper Time for Work; Vinegar for the Sick Room; Dogs a Cure for Consumption; Fasting in Acute Rheumatism; Epilepsy and Food, 151.

Business Announcements.

Dividend Notice, Bulwer Consolidated Mining Company.

Passing Events.

The recent big strike in Eegle gulch, Plumas county, referred to elsewhere in this number of the PRESS, is only illustrative of what we have frequently said that there are ae good mines in California ae enywhere in the world.

A new mining field has been discovered near the head of North Boise, hetween Atlanta and Banner, Idaho. The first locatione were made there last spring by John Hepburn, but eince that severel prospects have been staked off, and Idabo City is undergoing an excitement over the new discoveries.

Tbe latest excitement for gold is in tbe new placer mines on the middle fork of the Salmon river, Idaho. Some prospectore who discovered the gold on the bars took $1.55 from 10 pans of dirt, and other locators have got from 5 to 10 cents to the pan. The mines are situated on the hanks of the river, hetween 50 and 60 miles below Stoddard'e camp, and about 80 miles from Cape Horn.

The Calico district, in San Bernardino county, ahout which there is much talk at present, showe a good many good surface ledgee of pretty good ore. There is some sickness in the camp, and there are not so many there as formerly. The heat has been as great as 119°.

NEW MINES.—The country at the head of Canyon creek, North Yuha and Nelson oreek, on the county line between Plumas and Sierra, is fairly checkered with new locatione of mining claims. Indications are good for an exteneive gravel ohannel through that section of county, and many places on the surface prospect well—as high as half an ounce per day to the hand.

PROF. WALCOTT has shipped over two tone of foesile from Eureka to Washington, which he and hie party have collected in White Pine county. He eaye they comprise over 400 different speciee.

Tin.

Tin Ore and What Appears Like It.

In eubmitting to our readere this short notice on tin ore, it is perhaps desirable to make some preliminary remarks, and to state that our object is, if possible, to give the prospector searching for such ore a few plain directions, sn ae to enable him, without much trouble, to distinguish that ore from what appeare like it, and also to point out the character of the rocks in whioh it ie generally met with, and thereby save the prospector a needlese expenditure of time and money in looking for that ore in places where it is not to be found.

Tin stone or ore occnre disseminated in tbe ancient rocks, particularly granite; also in bede and veins, in large irregular masses called *stockwerks*, and in pebbles, an assemhlage of which ie called etream works, where it occasionally takes a ligneous aspect, and is termed wood tin. The important discovery of tin in Australia is not so recent as has been represented, and the great value of it was not realized until within the past few years. The late Dr. David Forbes, at a recent meeting of the London Geological Society, in 1881, said that he had received specimens of the granite from New South Walee tin region in the year 1859, and that he found them to be perfectly identical with the stanniferous granitee of Cornwall, Spain, Bolivie, Peru and Malacca.

Tin ore. nr cassiterite, occurs in considerable quantity in the eande of the river of Tipnani, in Bolivia, where, from its greater specific gravity, it accumnlates in the washing apparatus (lavaderos) during the process for extracting the gold; this was particularly found to he the case at Playa Gritada, at the establishment of Don Ildefonso Villamil.

This cassiterite is generally in emall semi-rounded nodules, frequently, however, showing one or more cryetalline faces, and varying in size from a mustard seed to that of a hazel-nut. It is generally pure; that is, without attached rock substance; the color is mostly a dirty brownish white or dark black, but fragments are occasionally mêt with of a line wine-yellow color, or even colorless and transparent.

The stream or placer tin is alwaya muob purer, and consequently more valuahle than that obtained direotly from the mines. In Australia, the operations of the tin mines were at first restricted to the working of the beds and banke of existing water-conrses and deposits near the surface, but now the beds of ancient streams 80 and 100 ft. below the surface are found to contain rich deposits of tin ore, and the working of them does not differ much from tbat of the drifting works of our deep placere.

It is indeed a matter of deep regret, as regards the pnblic welfare of this country, teeming with the most valuahle minerals, that we bave no geological map, or even any public collection of the rocks from the different mining counties, whose charactere have been determined and classified; eo that, unlike Australia and other countries, we have no map or collection to practically gnide, or point out to the prospector the tract or locality where he may look for tin, or other ores, with a reasonable prospect of succes».

There are only two ores of tin, a peroxide or cassiterite, containing 78.62 tin and 21.38 oxygen, having a specific gravity varying from 6.3 to 7.1; hardness, 6 4 to 7. The color variee from white to pink, ruby-red, gray, grayish-black to black. The second variety, tin pyrites, containing 26.5 tin, 30.5 sulphur, 30 copper; specific gravity 4 3 to 4.5; hardness, 4; color, steel-gray to iron-black, often yellowish.

The following are a few oree and rocks that have been mistaken for tin: Titaniferous iron, magnetic iron, chromic iron, hasaltic hornblende, silioate of iron, tungstate of iron, etc. Titaniferous iron has, however, only a epecific gravity of from 4.5 to 5; hardness, 5 to 6; magnetic iron, 4.9 to 5.2; hardnoss, 5.5 to 6; chromic iron, 4.321; hardness, 5.5. The hornhlende and silicate of iron have a speoific gravity of about 4; tungstate of iron, specific gravity, 7.1 to 7.55; hardness, 5 to 5.5. The color of tin ore varies from white to pink, ruby-red, gray and black. It therefore is certainly no very reliable criterion for distinguisbing tin ore. A eafer characteristic is the weight or epecific gravity. Unfortunately, tungstate of iron is nearly tbe same, or a little higher, hut not so hard ae tin, being only five. The color of the powdered ore forms a mnch better criterion than that of the unpowdered ore. The powder of good tin ore varies only from whitish-gray to dark drah, while tungstate of iron powdere reddish hrown, and titaniferous iron black. The value of stream tin ore, according to its freedom from gangue or dirt, varies from $200 to $300 per ton of ore.

The prospector may make a rude test of the suspected tin ore hy pounding it np with some iron pyrites or magnetite and then washing it out with a batex; if tin, it will be heavier than either of those ores. Then use a little galena, and it will he found to he abont the eame weight.

In a future issue we will give plain directions for making tin assaye with the hlow-pipe.

THE Idaho Telephone Co. expecte to have the Wood River towns connected hy telephone linee this fall, and will also run a line along the Wood River branoh of the Oregon Short Line.

The Blatchly Concentrator.

Thie is an invention of Dr. Blatohly, of thie city, and the late Guido Kustel. It is a modification of the Rittenger percussion table. The distinguiebing feature of the Rittenger table is the application of percussion to the side, drawing the heavy materials sidewise out of the stream of pulp instead of an end bump drawing tbem against the stream, as in the ordinary percuseion table. It also allows a more extended classification of the materials, from the lightest to the heaviest, and a number of different grades can be produced at one operation, which is impossible with an end-bump teble, which makes only two—waste, and one grade of concentrates.

The improvements consist in arranging the tables in pairs, (see engraving) to strike against each other, and as action and reaction are equal, only one-half of the power is required to produce the same effect. It prevents the creeping of the bumper, which, in process of time, will recede from the table, and it neutralizes the vibration of the frame; also, in mounting the the tables, one pair above another, in a frame allowing several pairs to be operated by the same cam shaft, without separate ehafts and pullies. In moving the tablee use rollers, causing them to move in parallel planes, instead of in arce of circles. Also an improved sizing box, and a surface of the table partly smooth and partly corrugated, greatly increasing their concentrating capacity; and in an elevator of sufficient power to elevate all the pulp from a five-etamp battery, and the middlinge from the concentrator, besides sundry minor improvements.

It is composed of six tables, in paire, one above anotber, supported by a massive frame. These tablee are placed on an incline of from one and a half to six degrees, according to the nature of the ore and the amount of water used on them. The coarser the ore and the less the water, the more must be the inclination. A lateral motion is imparted by means of oams on a vertical shaft, which paseee between eaoh pair of tables. The cams operate on tappets fastened to the under side of the tablee, throwing them apart, when two strong spiral springs throw them together with a sharp ehock or bnmp, giving to the table a shaking and percussive motion.

Bumpers extend the whole lengtb of the inside of the tables, except a small space in the center, where the cam shaft paeses between them.

The rollers snpporting the tablee are toothed, and oscillate on a toothed track which holds them in place. The tracke are adjustahle, allowing the inclination of the tables to be varied as required. The surface of the tables is composed of rubber partly smooth and partly corrugated, the corrugations extending crosswise. The motion of the tablee causes the heaviest particles to settle in the bottoms of the corrugations, and the percussion drawe them across on to the smooth rubber, while the lighter materials flow over the corrugations and pase off as waste.

Spouts extending across the bead of the tables, with numerous small holes, supply clear water. By closing or opening the holes the flow of water is regulated and applied to any part of the table. Movable boxes rest on the spouts and deliver the pulp on tbe outside corners of the tables. At the lower end of the tables are movable dividere pivoted at their lower ende, by which the etream of pulp ie directed into its appropriate channel. On the top ie a sizing bar which sizes the pulp into three different grades of fineness and takee off any surplus water.

An elevator is used to take up the middlings, and if it ie reqnired to set the concentrator ahove the battery it takes the pulp as it comes from the battery. The operation is as follows: The pulp is delivered to the elevator and passee into the sizing har where it is sized into three grades of fineness, tbe coarsest going to the upper pair of tables, which are set at a greater inclination than those below, which receive the finer grades—the finest going into the lowest pair, which have the least inclination.

The pulp ie applied to the outside of the tables on the corrugated rubber, the heaviest particles settling into it. The lighter particlee and water are scarcely diverted from a straight course by the percussion, and pass off as waste, while the heavier ones are drawn toward the inside, according to their various epecific gravities, and exposed to the action of the clear water, which washes away the impurities, and the clean concentrates paes through the pipes in the inside corner into a tank. Between the concentrates and the waste is what is called the middlings, containing some valuahle and some worthless materials; this passes to the elevator, and is resized and reworked.

Some oree contain gold whioh is coated, and which will not amalgamate. In ench casee, another division is added to the inside of the table, and the gold caught by itself.

This machine is adapted to treating fine sands, or slimes, or the tailings from a gold quartz mill, and one macbine will work all the pulp from a five-etamp battery. It is about six ft. by seven at its hase, and eight feet high. It can he seen at the Golden State and Minere' Iron Worke, 237 First etreet.

One of theee machinee, of a larger eize, taking the pulp from the etamps, ran in the Knox & Oeborne mine, near Mokelumne Hill, for 14 months.

The Denver Exposition—No. 3.

[Editorial Correspondence.]

The unfolding beauties of the exposition still continue to be a matter of daily and constant interest. Additions to the various departmente continue to come in, and changes in the arrangement of goods and decoratione present a constant transformation scene in many portions of the building. Some of the miscellaneous displays are very fine. Important additions to the mineral department are made every day. Many minere and mining men, both far and near, thought that the mineral exhibit would be a failure, and refused to take any intereet in the matter. Not a few of that class have come in to take a look, and have been so impressed with the value and importance of tbe exhibition, that they have hurried bome to prepare something which shall be representative of their own mines or eections.

The machinery department is also growing in importance every day. That portion of the building allotted to machinery is already full, and space has been cleared for new comers in one of the annexes, by removing wagons, carriages, agricultural machinery, etc., to some other locality. The exposition is now in very good shape, and quite fully meets the anticipation of its projectore and visitors in everything except attendance. That, however, is gradually improving; bnt as was stated in my first letter, the distance from the city is too great to draw large crowds, and always will be, no matter what the price of admission or character of attraction.

Mr. Edward G. Dennieton, of San Francisco, is here, and has opened out his display of silver-plated amalgamating plates. He occupies a prominent position on the border of the machinery department, which he has fitted up very neatly with railing, chairs, tables and a nicely carpeted floor. His place has been adopted as "California headqnarters," where the latest papere from the golden State may always be seen, and where numerous other California publications of interest to minere and othere may be seen and consulted. Silvered amalgamating plates are something new in Colorado, and Mr. Denniston will not fail to convince the gold minere here that they are much better for saving gold than plain copper amalgamatiug plates.

As there ie no system of seeson tickets here, except to exhibitors, commissioners and the press, a much larger number of new faces is seen in the building from day to day than is ordinarily met with on such occasions. The receipts are also larger in proportion to the attendance for the same reason. The building is kept open from an early hour in the morning until 10 o'clock, P. M. every day—Sundays not excepted; consequently a visitor, with a single ticket, can have about 14 honrs, if he desire it, in whioh time he can examine the exhibition thoroughly. The space assigned to the California mineral exhibit is still unoccupied, and conspicuous by reason of its emptiness.

Gilpin County and its Minerel Exhibit.

The exhibits of Colorado are arranged by counties, and Gilpin divides the honors with Lake in regard to superiority in county exhibits. Gilpin is emphatically the gold-producing county of the State, having turned out fully two-thirde of all the gold which Colorado has produced. She is also the pioneer mining county. In the spring of 1858, John Gregory, with a party of prospectors, wandered into the neighborhood of Clear creek, the north fork of which drains Gilpin county, and in the banke of that stream did the first mining and took out the first gold fonnd in Colorado. Following up thie creek into the mountains, he found the gold increasing in quantity as he advanced, until the party reached what has since been known as Gregory'e gulch, when they discovered that the chief supply of the gold in the stream helow was derived from the breaking down and washing away of a decomposed quartz vein which crossed the creek at that point. Here mining was commenced in earnest, and was soon transferred from the creek to the qnartz vein, and from that time to this, about 23 years, upwards of $6,000,000 has been taken out of this vein, and it is still producing. Mr. Naglee, the present manager of the mine, sets the amount of hullion output to date at fully $10,000,000, but I take the lower figure as one which everybody admits. Gilpin is the smallest county in the State, if not in the Union, it heing only about 10 hy 12 miles in extent of area; while the principal mines are found within a space of only four milee long by about one and a half broad. Along this extent of country ie an almost continuone town, known under the several names of Black Hawk, Central City and Nevadaville. But many valuable gold mines and all the principal silver mines are found outside of thie district. This mineral belt extends northwardly into and nearly through Bowlder county and southerly to Clear creek.

There are 541 patented properties in the county, hut only about 200 mines are being profitably worked. There are about 930 stempe in the county, most of whioh have been erected to do custom work, very few of the mine companiee owning mills. A eingle mill is generally put up to work a group of minee.

The Geological Formation of the County

Is gneissic; but granite ie almoet alwaye preent where the mineral veine are found—many veins lying between walls of granite and gneiss.

Hornblende occurs in dykes, and occasional patches of porphyry are met with. There must have been great disturbance here in early geological ages; the fissures and veins being all nearly perpendicular, while the surface has been so denuded as to leave it in rugged hills or mountains. According to the observations of J. Alden Smith, State Geologist, the mineral veins appear to be of three geological ages, but by far the greater number, including nearly all the best paying ones, are referred to the intermediate age. Veins are found dipping to the northward for several hundred feet, then changing to the opposite direction, like the Comstock mine in Nevada. The change in dip in both instances has probably been caused by extensive earth slides, the slide not moving a sufficient distance to break the continuity of the vein matter, merely bending it over, and causing it to incline to the depth of the slide in an opposite direction to that of its true dip.

Character of the Mineral Veins.

The gangue rock is a quartzose and feldspathic material—generally of a slaty structure, very soft, from the decomposition of the feldspar, thickly impregnated with iron pyrites, a small percentage of copper—generally two to three per cent.—with occasional streaks or bunches of galena. This, with the earthy matter, or loose material of the vein, is subjected to ordinary mill treatment, the general average of free gold being from $8 to $14 per ton. The sulphurets from the tailings are generally concentrated and sold to the furnace men, where it is used as a flux, in place of scrap iron, the gold going into the bullion product.

This grade of material generally comprises about nine-tenths of the entire lode, the balance being made up with streaks, or bands, and masses of iron and copper pyrites, often containing a little silver, and almost always accompanied with more or less zinc blende and galena. This portion of the mineral vein is readily separated by hand picking at the mine, and sold to the smelters with the concentrated sulphurets. Very little free gold is found, except near the surface, and where the vein matter has become much decomposed.

How the Smelting Ore is Sold.

The ore is first taken from the mine to the public sampler, as he is called, who, by the use of rock breakers, crushes the ore to a fineness which admits of its passage through a screen of four meshes to the inch. After being crushed, the mass is carefully sampled. A small portion of the sample is then pulverized very fine, and divided into five parts, each part containing sufficient for a dozen assays. One each of these portions is sent to the four smelting companies for a bid for purchase, the fifth sample being reserved for the owner of the ore, who, of course, accepts the highest bid, for which a check is immediately given. The public smelter is paid by the furnace companies, first two dollars per ton for crushing and sampling the ore, and also two and a half per cent. of the net value of the ore, as a commission for collecting the same for their respective companies.

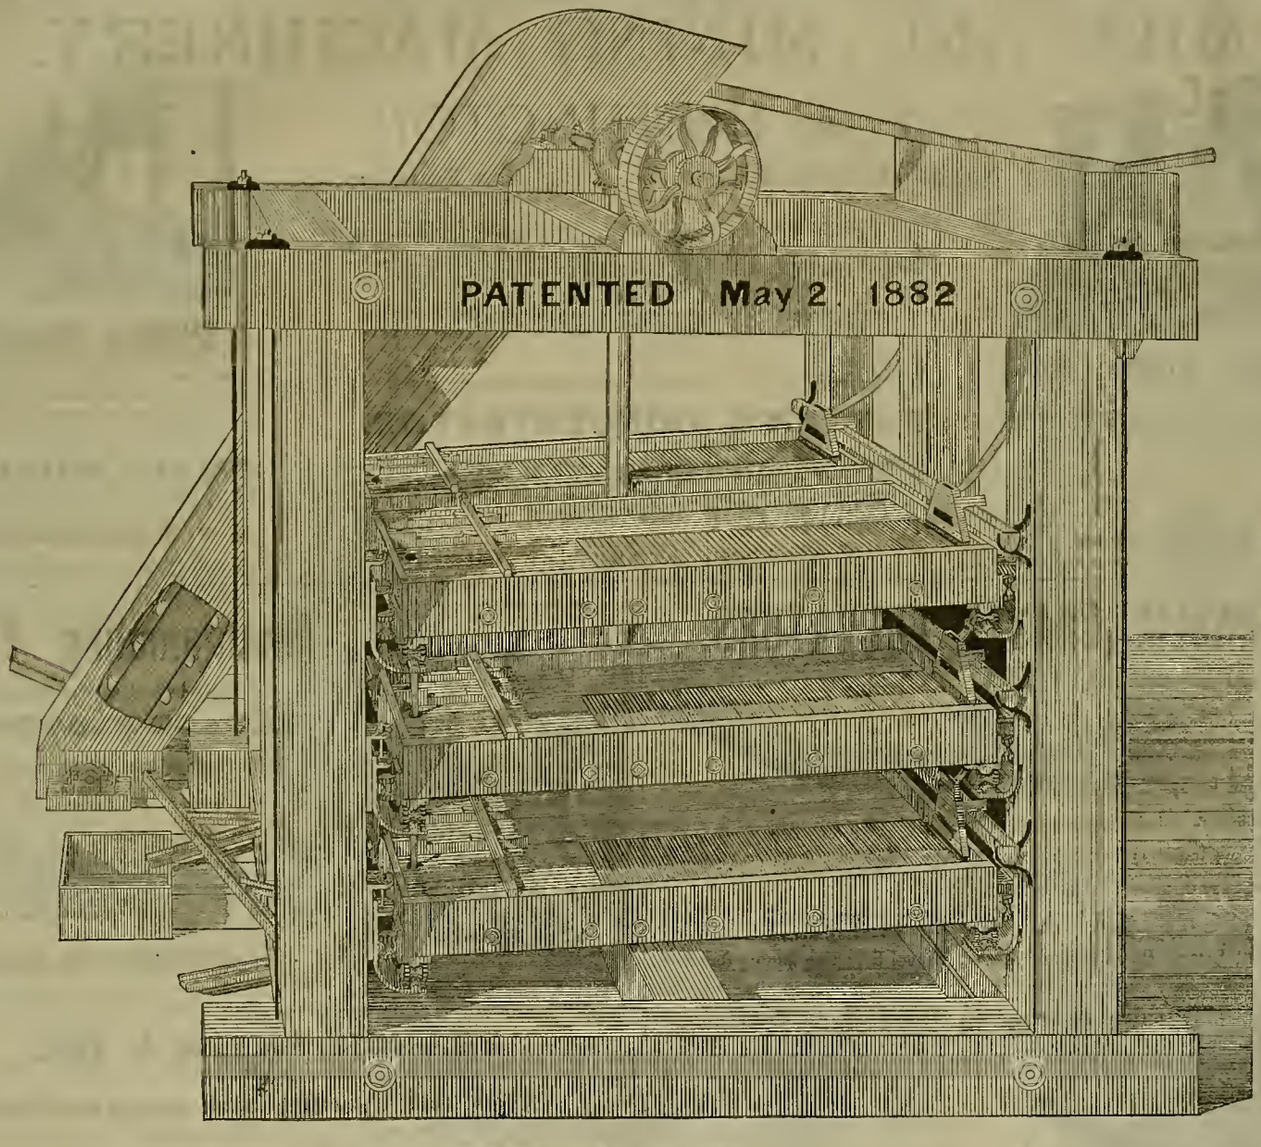
Ore is also sometimes sent direct from the mine to the smelter, in which case 95 per cent. of the gold and 90 per cent. of the silver, under scorification assay, is paid to the miner; but a charge of $20 per ton for furnace treatment is first deducted. If the ore also contains copper, the miner is allowed $2.25 for each per cent. of that metal contained. When the ore contains lead in workable quantity, a sliding scale of value is adopted, as follows: No lead is paid for unless the amount reaches 10 per cent. When it exceeds that amount, 20 cents a unit is paid for that metal. When the ore contains from 20 to 30 per cent. of lead, 30 cents per unit is paid. When it yields from 30 to 40 per cent., 40 cents is paid. When the ores exceed 40 per cent., special rates are paid. This, of course, is in addition to the precious metals. The smelters in all cases pay the freight on ores from the mines to the smelting works, which usually averages about $2.40 per ton. The freight on ores, salaries of agents and assayers, and cash paid samplers by the smelters generally reduces the $20 charged for furnace treatment to about $14. The ores are transported by railroad. The Colorado and Central railroad runs from Denver through Argo and Golden—where the furnaces are located—and thence directly through the heart of the mining districts of Gilpin county. It is said that this mountain division of the Union Pacific railroad is the best paying portion of their entire system of roads. It is said that the system of buying and selling ores which prevails in this, the oldest mining district in the Rocky mountains, is the one which ensures to the ore producers the best possible returns for their products.

The Smelting Works.

The reports from the smelting works show a general net average to the miner of not less than $50 dollars per ton for smelting ores from this county. There are four smelting works in operation within 12 miles of this city—one at Argo, known as the Argo works, four miles distant, and three at Golden, 12 miles distant, on the same railroad and between this city and the mines. Golden is just within the foothills. Only two of these works separate the gold and silver. The other two produce bullion—chiefly lead and copper matte—and ship both eastward to or beyond Omaha for separation. The Argo works are very extensive, where the gold and silver is separated. These works treat about as much ore as the three works at Golden united.

A future letter, or perhaps two, will be devoted to a description in detail of these four smelting works, in which will be given all that the public are allowed to know in regard to the manner and method of their treatment of ores; for a portion—that of the separation of the gold and copper—is kept a secret. Your correspondent has visited and carefully inspected each establishment, and at each was cordially received, and every facility for observation accorded to anyone was freely extended to him.

Milling ore is usually measured here by the cord—about seven and one-half tons of average dry ore making one cord. The cost of milling is universally $15 per cord, or two dollars per ton. The mines are very easily worked, being of good workable width as regards vein matter, and the water is generally easily kept under control. The Cornish pump is used. A mine paying eight dollars per ton for its milling ore, with anything like a fair proportion and quality of smelting ore, is considered a very valuable property.



THE BLATCHLY CONCENTRATOR.

The Silver Mines of Gilpin County.

Outside of the large group of gold mines already described, and in every direction surrounding it, and in one instance passing through it, there is a belt of highly productive silver mines, quite similar in general characteristics of gangue to the gold-bearing veins, the principal difference being that the predominating mineral is silver instead of gold. These veins first began to attract attention in 1864; but as they could not be worked by the ordinary gold process, no attempt was made to open them until some four years later, when smelting works were erected in that vicinity. Since that time these mines have come into considerable importance, and the gold mines also have become more valuable, from the fact that a new and better treatment is now attainable for a portion of the more refractory ores.

Gilpin County Gold Ores.

There is probably no portion of the extended mining regions of the Rocky mountains or of the Sierras where the ores are more complicated, or where they have received more careful study than in Gilpin county. Nor is there any locality where they are more successfully treated. In view of the experiments made and the success attained, it is thought but very little is left for future study or improvement. Much that is new has been introduced here.

Endlich, in Hayden's Report of 1873, describes the ores of this district as mainly pyritic, carrying chalcopyrite, galenite and sphalerite, with isolated appearances of argentite. Experience has shown that chalcopyrite and the finely disseminated pyrites yield the best production of gold; while the galenite and sphalerite contain the silver. In the massive pyrites the gold yield is smaller. Chalcopyrite occurs in every paying gold mine in Gilpin county, and whenever it is more abundant the miners are rejoiced with a never-failing increase of the gold yield. Zinc blende is also found, and in some localities in large quantities; but no attempts have been made to obtain any portion of the zinc.

Many improvements have also been introduced of late years into the manner of milling and in some localities in large quantities; but no attempts have been made to obtain any portion of the zinc.

Many improvements have also been introduced of late years into the manner of milling

Tunneling Enterprises, etc.

Several important tunnel enterprises have been started in Gilpin, or proposed, designed to open up, drain and develop various groups of

CHICAGO **FRASER & CHALMERS,** ILLINOIS

MANUFACTURERS OF IMPROVED AND APPROVED FORMS OF

MILL AND MINE MACHINERY.

Having made extensive additions to our Shops and Machinery, we have now the LARGEST and BEST APPOINTED SHOPS in the West. We are prepared to build from the Latest and Most Approved Patterns,

QUARTZ MILLS

For working gold and silver ores by wet or dry crushing. The Stetefeldt, Howell's Improved White, Brunton's & Bruckner Furnaces, for working base ores. Rotary Dryers, Stetefeldt Improved Dry Kiln Furnaces.

SMELTING FURNACES,

Water Jackets, either Wrought or cast iron, made in sections or one piece, either round, oblong, oval or square. Our patterns most extensive in use. SPECIAL FURNACES FOR COPPER SMELTING. Slag Pots and Cars, improved form. Bullion and Copper Moulds and Ladles, Litharge Cars and Pots, Cupel Furnaces and Cars.

HOISTING ENGINES

Large or Small for flat or round rope. Double Cylinder Engines, from 6x10 to 18x60. This latter size furnished J. B. Haggin for Giant and Old Abe Co., Black Hills also Corliss Pumping Engines, 20x60, for Hoisting and Pumping Works, for 2,000 feet deep. **Baby Hoists for Prospecting, 4 H. P. to 6 H. P.**

Wire Rope, Safety Cages and any Size and Forms of Cars.

Principal Office and Works, Fulton and Union Sts., Chicago, Illinois.

Frue Ore Concentrator, or Vanner Mills.

Coarse Concentrating Works, Improved Jigs, Crushing Rollers, Sizers, Trommels, Rittenger Tables, and all other adjuncts for the proper working of Gold, Silver and Copper Ores, complete in every detail.

HALLIDIE IMPROVED ORE TRAMWAYS. We refer to Gen. Custer mine, Idaho, 5,000 feet long; Columbus Mine, Col., 4,750 feet long; Mary Murphy mine, Col., 5,000 feet long, all in constant operation.

LEACHING MILLS,

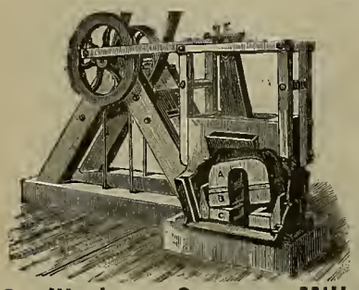
Improved Corliss and Plain Slide Valve Meyer's Cut-off Engines.

CORLISS ENGINES from 12x30 Cylinders to 30x60. PLAIN SLIDE VALVES from 6x10 to 36x30. BOILERS of every form, made of Pine Iron Works C. H. No. 1 Flange Iron, or Otis Steel. Workmanship the most careful. All Rivets Hand Driven.

McCaskell's Patent Car Wheels and Axles—Best in Use.

New York Office, Walter McDermott, Manager, Room 32, No. 2 Wall St.

MILL AND MINING MACHINERY.



Oscillating Stamp Mill.

It has no Stems, Cams, or Tappets, and adjusts itself to the wear of the Shoes and Dies.

For simplicity, economy, durability and effective working, it exceeds anything ever presented to the public, and will do the work of five stamps with one-fourth the power. Awarded First Premium and Medal at Mechanics' Fair, S. F., 1880.

Manufactured by

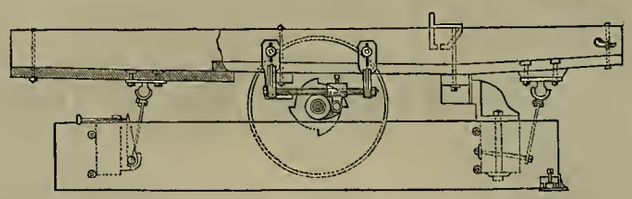
F. A. HUNTINGTON, 220 Fremont St., S. F., Cal. | FRASER & CHALMERS, 145 Fulton St., Chicago, Ill.

Improved Patent Grinding and Amalgamating Pans, Concentrators and Gold Amalgamators; also, Steam Engines and Mining Machinery of all kinds. Send for circulars.

F. A. HUNTINGTON,
220 Fremont Street, San Francisco, Cal.

F. A. HUNTINGTON,

No. 220 Fremont Street, - - San Francisco, Cal.

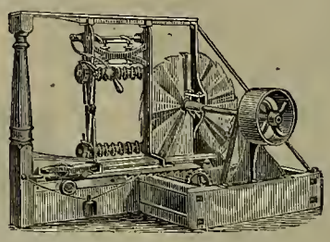


PATTEN'S CONCENTRATOR.

This machine requires less power, less care or attention, and is less liable to get out of repair than any concentrator now in use. All of which any practical miner will comprehend when seeing it in operation.

The wear and tear is nominal, and the construction so simple that any miner can put it up and run it; and the low price brings it within the reach of all mill men, as it will save enough to pay for itself in any mill in very short time. One machine will concentrate the tailings from a five-stamp battery.

☞ Send for Circulars. ☜



SHINGLE MACHINE.

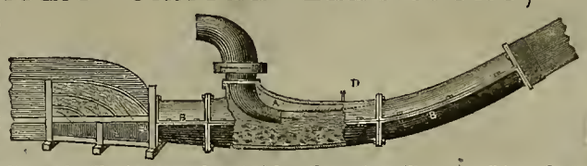
For simplicity, durability and rapidity of action, these Machines have no equal, cutting from 3,000 to 4,000 per hour. They are now used by all the principal Millmen on the Pacific Coast.

SAWMILL MACHINERY,

Of all descriptions made to order.

F. A. HUNTINGTON,
No. 220 Fremont Street, San Francisco.

HYDRAULIC GRAVEL ELEVATORS,



For working flat gravel mines that have no dump.

Sluices gravel and water up hill on an angle of 45°, and will run any kind of gravel that will run in a flume. Handles rocks as easy as fine dirt, and will raise as much material as the water will carry off in a flume on 6 inches grade to 12 feet.

No bedrock cuts, tunnels or drains required. Machine a sufficient drain itself, and the process of mining the same as any other hydraulic mine. Is now a practical success in various places in California and Oregon. Send for descriptive circular to

JOSHUA HENDY.

Amalgamating Plates

REPLATED OR MADE TO ORDER BY THE

CHICAGO PLATING CO.

Pacific Power Building, 23 Stevenson St., S. F.,

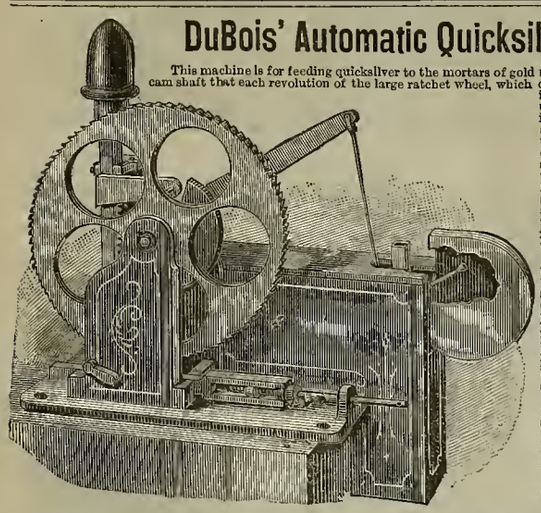
And 201 & 203 Randolph St., Chicago.

Having opened a branch house in S. F., the largest Plating and Polishing Establishment on the Pacific Coast, with all the latest improvements in machinery for plating in Gold, Silver and Nickel, with 12 years' experience in the Eastern States and Europe, we claim that our Silver Plated Amalgamating Plates are the most economical, durable, and successful Plates on the Pacific Coast for saving gold. Every description of metal goods ated in the most durable manner by the

CHICAGO PLATING CO.

A. RUDGEAR, H. D. PARR, } Proprietors, S. F.

DuBois' Automatic Quicksilver Feeder.



This machine is for feeding quicksilver to the mortars of gold mills. It is so connected to the cam shaft that each revolution of the large ratchet wheel, which can be regulated to revolve once in one, two, three or four minutes, as desired, dips a small cup into a reservoir of quicksilver, and by a trip of the cam, empties the contents into a pipe leading down to the mortar, supplying an exact quantity at regular intervals, superseding the ordinary hand feeding, which is of necessity subject to great irregularity, and liable to neglect. It renders the amalgamation of all the gold in the pulp equally certain and perfect.

The mechanism to produce this depression and elevation of the cup, is driven by the cam shaft, similarly to the self-feeders, over which so much ingenuity has been expended to regulate the delivery of ore to the mortar. As it is to be desired to have the ore go in constantly and regularly, so it is equally desirable to have the mercury fed constantly and regularly.

A chief point of excellence of this machine is, that it allows the quantity of mercury which would be otherwise fed in mass, in one hour, to be subdivided into a number of small portions, and fed almost continuously; *i. e.*, from every one to four minutes.

Price, complete, $75.

For Sale by } **WHITNEY & MARSHALL,** { Sole Agents

22 & 24 Fremont St., San Francisco.

Dealers in Iron, Steel, Hardware and Mining Supplies, Wrought Iron Pipe and Fittings, Pump Columns, Wire Rope, etc. A large stock of Boiler, Plate and Sheet Iron of every description.

SHEET IRON PIPE.

FRANCIS SMITH & CO.,

Manufacturers of

THE PATENT CHANNEL IRON WHEELBARROWS.

THE STRONGEST BARROW MADE. These Barrows are made by Superior Workmen, and of the best material. All sizes kept constantly on hand

SHEET IRON PIPE.

Lap-Welded Pipe, all Sizes, from Three to Six Inches. Arteeian Well Pipe. Also, Galvanized Iron Boilers, from 25 to 100 Gallons.

Iron Cut, Punched, and Formed for making Pipe on ground, where required. All kinds of Tools supplied for making Pipes. Estimates given when required. Are prepared for coating all sizs of Pipes with a composition of Coal Tar and Asphaltum.

Office and Manufactory, 130 Beale Street, San Francisco.

(CONTINUED FROM PAGE 153).

mines at a greater depth than now worked. These tunnels are independent operations, having no claim upon the mines which they pass through, and which are already being worked. In fact, they have to pay for the right of way through developed mines, and in turn the mines expect to pay a royalty to the tunnels for all ore which may be put out through them.

In many instances individual mines have been consolidated under a single management, by which they can be more economically worked. The Gunnel Consolidated is an instance, which has taken out $1,160,053 during the last six years.

The Hidden Treasure has been worked to a depth of over 1,320 ft., and is the deepest mine in Colorado. The company owns a 30-stamp mill, and still sends large quantities of rock to the smelting works. During 11 months of 1881, about 8,700 tons of milling ore were worked, which realized about $10.50 to the ton, and 380 tons of smelting ore at $75 per ton, aggregating $90,315. This company owns its mill, which is run by water, having an overshot water-wheel 50 ft. in diameter.

The Bobtail company reports the yield of its mine for 1881 at $275,000, the average of the smelting ore being unusually high—$125 per ton. The mine has been opened to a depth of 1,020 ft. The company owns a 125 stamp mill—the largest in the State—and will greatly increase its output another year. The tunnel operations of this mine are the most extensive in the State.

The Exhibit of Gilpin County

Is one of the finest in the building. In extent and massiveness it takes the lead. No mines are more fully shown than are those of Gilpin county. About 82 mines are represented, with others still coming in. There are many masses of ore shown as large as could be practically hoisted from the mines. Immense blocks of ore, shown from the Tierney lode, near Central City, are a mass of rich sulphate gold rock weighing over five tons. A fine specimen weighing 660 lbs. is also shown from the lowest level of the Hidden Treasure. A large mass from the Bobtail, with nine surface entirely covered with peacock copper ore, weighs about 500 lbs. The Whitney mine shows a one and a half ton specimen. A 200-lb. specimen of rich gold smelting ore, carrying copper and silver, is shown from the famous Kansas lode, recently purchased by an English company. And right here we may remark that the attention of English capitalists is rapidly being drawn to this as a promising region for mining investments.

Other smaller mines are shown to the number of many hundreds, and covering an area of 42 by 21 ft. This section has been elegantly fitted up at considerable expense and in excellent taste. It is covered with draperies of gold, blue, maroon, etc., with lace-curtained windows, carpeted office, desk, chairs and other bodily and esthetic comforts. The presiding genius, who has brought together all these massive ores, rich specimens and elegant cabinet gems from the dark depths of Gilpin county mines, is Col. Thomas Manning, who represents the county as special commissioner. Nearly all the credit of the exhibit is due to the active exertions and indomitable energy of this gentleman, who, though comparatively a new comer into the district, has already taken a stand as a leading man. He is the owner of three mines, the exhibits from which are modestly hid away in the rear of the other exhibits, and are not seen at all by the casual observer. There is no special reason for this, however, as the mines, though but recently opened, are exceedingly promising, and, as might be expected from the character of the owner, are worked with intelligence and skill. His mines are named the Silver Dollar, Piper Heidsick and Becky Sharp. His power for hoisting and pumping is derived from two 25-horse power engines. The Silver Dollar, as its name implies, is a silver mine, and strikes and crosses the Piper Heidsick, a gold mine, at the depth of 175 ft. Where the two mines intersect, there are about 10 inches of gray copper ore, very rich in copper and silver, also carrying gold. Mr. Manning certainly ought to, and undoubtedly will, reap a rich reward for his investment.

A Very Rare Mineral.

The Silver Dollar mine carries a very rare copper ore, known as *enargite*, said by Dana to be found in only seven localities on the globe, one of which is this, known to Dana as "Willis gulch." A neighboring mine, the "Powers," has developed large quantities of this mineral, which there occurs in large cubical crystals, and as such, and in an amorphous state, forms 48% of the value in the yield of the mine. This is essentially an arsenical copper mineral, consisting usually of about the following constituents: Copper, 47; arsenic, 17; silver, 31; the balance being made up of antimony, iron and silver.

The Most Striking Feature

Connected with the exhibit of this county is a tall, slender obelisk covered with gold leaf, standing upon a large square base colored in imitation of silver, and each intended to represent the bulk of those two metals which Gilpin county has added to the gold and silver of the world. It is now some 22 years since the mines of this county were first discovered, and her contributions, as above, have aggregated $35,500,000 in gold, and $3,000,000, in silver. A column 20 ft. square and 65 ft. high would be required to represent the copper product of the county. No estimates have been made of the bulk of the lead product, but it must be very large.

As will be readily inferred from the geological character of the county, and the mineralogical and other characteristics of the mines as already given—many of them being true fissure veins, occurring between walls of granite and gneiss—there is every reason to believe that they will pay and continue to be worked to the lowest depths of practical mining, where heat and water present the least hindrance to going down. If such should be the case, mining has but just begun in this and the neighboring counties of Bowlder and Clear Creek.

Elegant Cabinet Specimens.

We cannot close this somewhat lengthy notice of this county and its exhibit without making a brief notice of the six splendid cabinets of choice minerals, which have been gathered with much care from the mines of this locality, and which, in themselves, present an interesting study, which might occupy weeks of time to the close student of mineralogy, and which at the same time form a most interesting object for those curiously inclined in the way of admiring such wonderful productions of nature.

W. B. EWER.

The Golden Gate Fair.

Preparations for the Golden Gate fair, which will open on the grounds near Shell Mound, Oakland, on next Monday, Sept. 4th, are now well along, and assure both the visitor and the exhibitor most excellent accommodations. The ease of reaching the grounds by rail, as the Berkeley trains stop almost at the entrance to the grounds, will enable throngs of people to enjoy a few days' rural sports and sight-seeing at slight cost. The excellence of the stock of all kinds which is promised by the breeders will attract all lovers of fine animals. The leading cattle herds and sheep flocks of the State will be represented, and swine of the purest blood and best form will be abundant. In horses the fair promises to be peerless. Governor Stanford has promised a large exhibit of his famous Palo Alto thoroughbred and trotting stud. Mr. Stanford shows much public spirit in taking these fine animals to the fairs, where the public can view them, and as the first appearance will be at Oakland the horses will be at their best. Among the features of the horse exhibition will be the display of old Thad Stevens, the famous California running horse, now the property of R. P. Clement, and a large family of his colts. Aside from these, there will be, of course, a host of fine horses—both those entered for premiums and those taking part in the well-filled race programme. In the matter of racing events the Association claims to be able to make a better showing than any other on the Pacific coast. They have the privileges of the best race-track in the United States—the track preferred by horsemen above all others when speed is the *sine qua non*.

The ladies' equestrian tournament will be one of the best features of the fair, as it will simply include park riding and the equestrianism ordinarily displayed and necessary in the management of such animals as are usually managed by women. There will be no rough riding, no fox-hunting feats, and no racing. Furthermore, it is the intention of the directors that no objectionable characters shall enter as competitors, and that the whole affair shall be conducted in a decorous manner.

The arrangements for the competitive drill, to be held on the closing day of the fair, are about completed, and programmes are being prepared. The following companies of infantry have signified their intention to compete: Company H., Second Artillery regiment, N. G. C., Capt. George Bigley commanding; Company F., Second Artillery regiment, N. G. C., Capt. F. V. Bell commanding; Capt. H. P. Filgate's Company B., of the Third Independent regiment, and Capt. M. E. O'Donovan's company, of the same organization. For the cadet drill there will be two entries, viz.: The Boys High School Cadet Company, of the Second Artillery regiment, Capt. W. C. Sharpstein commanding, and the St. Patrick Cadets. The drills will be held between the hours of 11 A. M. and 2 P. M., on Saturday, commencing with the cadets at 11 o'clock, and the three hours will be divided equally among the companies competing. The judges of the drills will be Major R. T. Frank and Captain J. P. Sanger, of the First United States Artillery, and Capt. Moses Harris, of the First United States Artillery.

Among the other interesting features will be the bicycle races, when fast riders will compete on the now popular "wheel."

Agents Now Wanted.

Extra inducements will be offered for a few active canvassers, who will give their whole attention (for a while at least) to our business. Apply soon, or address this office, giving address, age, experience and reference.

DEWEY & CO., Publishers,

No. 252 Market St., S. F.

For Sale.

A twenty-stamp steam mill, complete and almost new. Also, air compressors, drills and mining machinery. Anyone having a gold or silver mine warranting the investment, may buy this material on time by making monthly or quarterly payments. Address, CHARLES E. SHERMAN, Havilah, Kern County, Cal.

PATENTS AND INVENTIONS.

List of U. S. Patents for Pacific Coast Inventors.

From the official list of U. S. Patents in DEWEY & CO.'s SCIENTIFIC PRESS PATENT AGENCY, 252 Market St., S. F.

FOR THE WEEK ENDING AUGUST 22, 1882.

262,932.—STATION INDICATOR—John Coxen, S. F.

263,186.—CAR COUPLING—John C. Look, Yuba City, Cal.

263,194.—TONGUE SUPPORT—Ela Moore, Walla Walla, W. T.

263,057.—VEHICLE BRAKE—M. M. Nathanson, S. F.

263,216.—APPARATUS FOR REGULATING THE PRESSURE IN DISPENSING MALT LIQUORS—Chas. C. Redmond, San Jose, Cal.

263,227.—CARE FOR CABLE RAILWAYS—Henry Root, S. F.

263,066.—VEHICLE SPRING ATTACHMENT—D. Shelton, Santa Rosa, Cal.

NOTE.—Copies of U. S. and Foreign Patents furnished by DEWEY & CO. in the shortest time possible (by telegraph or otherwise) at the lowest rates. All patent business for Pacific coast Inventors transacted with perfect security and in the shortest possible time.

Notices of Recent Patents.

Among the patents recently obtained through Dewey & Co.'s SCIENTIFIC PRESS American and Foreign Patent Agency, the following are worthy of special mention:

BRAKE.—Martin M. Nathanson, S. F. No. 263,057. Dated Aug. 22, 1882. This vehicle brake consists in forcing conical pieces into hollow conical attachments on the hubs of the wheels by means of an operating rod pressing and forcing toggle levers, the whole being operated by a hell crank lever and a rod within the body of the vehicle.

CARS FOR CABLE RAILROADS.—Henry Root, S. F. No. 263 227. Dated Aug. 22, 1882. In this class of roads the dummy or grip-car travels in front of the attached cars, so as to give the operator an unobstructed view of the track. This grip car is usually made up of two frames, one of which is mounted upon springs and carries the seats for passengers, forming an open car. The other frame may be attached to boxes directly upon the axle, or it may be attached to the bottom of the boxes which carry the springs, and it thus carries the gripping apparatus at a nearly fixed hight above the surface of the track. The frame which is supported upon the springs has a considerable range of movement, from variable loads and from the plunging motion caused by the inequalities of the track. It does not, therefore, furnish that rigid support which is required for carrying the fender at a fixed distance above the surface of the street, and at the same time so close to it at all times as to make it impossible for it to pass over any persons who may fall in front of the cars.

Old Papers Wanted.

Twenty cents each will be paid for a limited number of copies of any of the following Nos. of the MINING AND SCIENTIFIC PRESS, if received soon at this office: No. 1, of Vol. 13, 1866; No. 5, Vol. 18, 1869; Nos. 1 and 26, of Vol. 20, 1870; No. 1, of Vol. 22, 1871. Also, 10 cents per copy for Nos. 2, 3, 4, 7, 10, 11, 12, 13 and 15, of Vol. 30, 1875. If any one who has files of back volumes of the PRESS, which they may like to dispose of at a moderate rate, will send us a memorandum of the same and the price, we may be able, sooner or later, to assist in their disposal.

Attend to This.

Our subscribers will find the date they have paid to printed on the label of their paper. If it is not correct or if the paper should ever come beyond the time desired, be sure to notify the publishers by letter or postal card. If we are not notified within a reasonable time we cannot be responsible for the errors or omission of agents.

HOW TO STOP THIS PAPER.—It is not a difficult task to stop this paper. Notify the publishers by letter. If it comes beyond the time desired you can depend upon it we do not know that the subscriber wants it stopped. So be sure and send us notice by *letter*.

The undersigned are agents for, and are prepared to furnish prices and all particulars for

Mining and Other Companies.

Persons interested in incorporations will do well to recommend the publication of the official notices of their companies in this paper, as the cheapest appropriate medium for advertising.

DIVIDEND NOTICE.

OFFICE OF THE

Bulwer Consolidated Mining Company.

San Francisco, August 25, 1882.

At a meeting of the Board of Directors of the above-named company held this day, dividend No. 10, of ten cents (10c) per share, was declared, payable on TUESDAY, September 12, 1882. Transfer books closed on Saturday, September 2, 1882, at 12 o'clock M. This dividend is payable at the Farmers' Loan and Trust Company in New York on all stock issued there, and at the office in this city on all stock issued here. WM. WILLIS, Sec'y.

Seaton Gold Mining Company—Location

of Principal place of business, San Francisco, California. Location of works, Drytown, Amador county, California.

NOTICE.—There are delinquent upon the following described stock, on account of Assessment No. 1, levied June 6, 1882, the several amounts set opposite the names of the respective shareholders, as follows:

Name.	No. of Certificate.	No. of Shares.	Amount.
Martin, A. (Trustee).....	9	5,000	balance, $350.00

And in accordance with law, and an order of the Board of Directors, made on the 6th day of June, 1882, so many shares of each parcel of such stock as may be necessary will be sold at public auction, at 528 California St., Room 6, San Francisco, Cal., on Wednesday, August 16th, 1882, at the hour of 4 o'clock P. M., of said day, to pay said delinquent assessment thereon, together with cost of advertising and expense of sale. A. MARTIN, Sec'y.

OFFICE—Room 6, 528 California St., San Francisco, California.

POSTPONEMENT.

The day of sale of the above-named delinquent stock is hereby postponed to THURSDAY, the fourteenth (14th) day of September, 1882, at the same hour and place. By order of the Board of Directors. A. MARTIN, Sec'y.

ASSESSMENT NOTICE.

Gould & Curry Silver Mining Company.

ASSESSMENT, NO. 43.

Levied	August 24
Delinquent	September 25
Day of Sale	October 19
Amount per Share	Fifty Cents

ALFRED K. DURROW, Sec'y.

Office—Room 69, Nevada Block, 309 Montgomery St.

Bullion Silver Mining Company.—Location

of principal place of business, San Francisco, California; location of works, Gold Hill Mining District, Storey County, Nevada.

Notice is hereby given that, at a meeting of the Board of Directors, held on the first day of August, 1882, an assessment (No. 25) of Fifty (50c) Cents per share was levied upon the capital stock of the corporation, payable immediately, in United States gold coin, to the Secretary, at the office of the Company, Room 3, No. 328 Montgomery street, San Francisco, Cal.

Any stock upon which this assessment shall remain unpaid on the fifth day of September, 1882, will be delinquent, and advertised for sale at public auction; and, unless payment is made before, will be sold on WEDNESDAY, the 27th day of September, 1882, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Directors.

MINING MACHINERY A SPECIALTY.

Our manufactures of mining machinery embrace every kind of machine and appliance for the mining and reduction of ores.

We have had an experience of more than twenty years in the manufacture and practical operation of mining machinery in Colorado and the neighboring States and Territories.

Our facilities are superior to those of any manufactory in the West, our works having been recently rebuilt, greatly enlarged and completely equipped.

We invite the investigation of mine owners and mill men seeking machinery. We can furnish, on board, at our works, or set up at the mines anywhere in the Rocky Mountain region, on short notice, the following machinery: Cornish Pumps, Steam Pumps, Stamp Mills for Wet or Dry crushing, Pans, Settlers, Agitators, Retorts, Bullion and Ingot Moulds, Reverberatory Furnaces, Bruckner Cylinders, Revolving Roasting Furnaces and Dryers, Melting Furnaces, Concentrating Machinery, Rolls, Crushers, Conveyors and Elevators, Ore Samplers and Grinders, Hoisting Engines, Water Jacket Furnaces, Slag Pots and Cars, Lead Pots and Ladles, Blast Pipes and Water Tayeres, Blowers, Cupella fon Furnaces, Market Kettles, Wire Rope Cages, Buckets, Skips, Ore Cars, etc. Estimates furnished and prices quoted on application. Send for illustrated catalogue.

WATER JACKET SMELTING FURNACES

—FOR—

Galena Silver & Copper Ores.

The PACIFIC WATER JACKET SMELTERS embrace many features that are entirely new and of great practical utility, which are covered by letters patent.

No other furnaces can compare with these for durability and in capacity for uninterrupted work.

MORE THAN SIXTY of them are now running on the Pacific Coast, giving results never before obtained as regards continuous running, economy of fuel, grade and quality of bullion produced. We are prepared to demonstrate by facts the claims here made.

These Smelters are shipped in a complete state, requiring no brick or stone work, except that for the crucible, thus saving great expense and loss of time in construction.

Complete smelting plants made to order of any capacity and with all the improvements that experience has suggested as valuable in this class of machinery. Skilled and experienced smelters furnished when desired to examine mines and to superintend construction and running of furnaces. Estimates given upon application.

Send for circular.

AIR COMPRESSOR.

SPECIAL ADVANTAGES.

Absoluto certainty in the action of the valves at any speed. Perfect delivery of the air at any speed or pressure. The heating of the air entirely prevented at any pressure. Takes less water to cool the air than any other Compressor.

Power applied to the best advantage. Access obtainable to all the valves by removing air chest covers. Entire absence of springs or friction to open or shut the valves. No valve stems to break and drop inside of cylinders.

Have no back or front heads to break. The only Machine that makes a perfect diagram. No expensive foundations required. Absolute economy in first cost and after working.

DISPLACEMENTS in air cylinder perfect. Showing less leakage and friction than our competitors and a superior economy of about 20 per cent.

Small Sizes made in Sections not to Exceed 300 lbs.

PACIFIC MACHINERY DEPOT.

The Korting's Injector is the simplest, cheapest and best in use. Will draft its own water, hot or cold, and feed under varying pressure. Send for Circular.

VOLUME XLV Number 11

Power for Underground Work.

The question of the best and most economical power for underground work is by no means a settled one. At present, compressed air takes the lead for various obvious reasons. The well-known Mr. Henry Davey, of Leeds, in a paper on "Mining Machinery," read before the Institute of Mechanical Engineers recently, in dealing with the question of the economical application of power, remarked that electricity was now becoming recognized as a practical method of transmitting power; and as the same appliances which might be used for that mode of transmitting power might also be used for producing light, there seemed a future in mining operations for the utilization of this form of energy. It was possible that the mechanical operations underground requiring small powers, with the lighting, might be done eventually by means of electricity transmitted from a dynamo-machine worked on the surface. From the same source the surface works might be lighted. This idea led to a consideration of the source from which the power was or might be derived. Electricity as a transmitter of energy was economically practicable; but as a source of power or prime mover there was little likelihood of its competing with coal. Heat in steam, gas or air engines must be looked to as the source of power, except in districts where water-power was available; but it was in these latter districts that there was a field for electric transmission. Water pressure was often available in metalliferous mining districts, either at the mine or at some distance from it. When at a distance, the power might be developed by means of water-wheels, turbines or water-pressure engines; might be transmitted by electricity to the mine, and might there be made available for driving the machinery. But these cases were exceptional; and for economy in the production of power in mines generally, the author would direct attention to the results which had been obtained with gas engines, and would venture to predict that the gas engine, or rather the hot-air engine, worked by the quick combustion of gas, was likely to play an important part in mining as well as in other spheres of industry. From present experience it was perhaps not visionary to suppose that the time was not far distant when tall chimneys would cease to pour blackness over our towns and country, and when coal, still continuing to be the chief source of power, would be completely consumed in the shape of gas, or burnt direct under pressure. Modern experience pointed to the hot-air or gas engine as the prime mover, and to electricity as the transmitter of power in the future.

Other gentlemen differed from this view. Mr. Greig said, with respect to the haulage and general work underground, he thought Mr. Davey might have gone further than he had done. As far as his experience went, he was of the opinion that the only present improvement lay in the direction of compressed air. It was of the utmost importance in a mine that the power should be sent all over it, and the air was a very convenient agent in that respect. What was wanted was some power which spread to the extremity of the mine, and which would enable them to go in any direction with their tube, and so save an immense amount of labor by keeping the engine always at the front. Regarding the direct-acting engine, Mr. Greig stated that an engine had recently been put down by Messrs. Brown and Adams, which drew up five tons of coal every minute from a depth of 740 yards. But, said he, the difficulty of the whole thing arose in not being able to get the stuff to the front. He did not agree with having immense engines to bring up a large quantity at once. He thought it better to have smaller engines and less difficulty at the bottom of the shaft.

Mr. B. Walker could not conceive of any system of working a small winding engine, say at three miles from the mouth of the pit, that would be so economical as that of compressed air. He had adopted the compressed-air system in the construction of a large overhead-traveling crane for the Midland Railway Company. One of the conditions was that the crane should start with its load slowly, and then go along "full tilt," as it was said, and for that compressed air answered most satisfactorily.

Academy of Sciences.

At the regular meeting of the Academy, on Monday night, Vice-President Behr in the chair, E. B. Bail and Miss Nellie G. Sanborn were elected resident members, and the following were proposed: J. A. Paxton, G. Cadwalader, T. R. Waggoner, M. D., A. Barstow, J. M. Kelly, Miss Isabel Downie, Prof. W. E. James and Robert Hawxhurst. It was reported that an election to fill the vacancy in the Board of Trustees, caused by the death of B. B. Redding, resulted in the choice of Charles F. Crocker, and that George E. Gray had been elected President of the Board of Trustees. Thomas P. Madden was chosen Vice-President, vice George E. Gray.

Robert E. C. Stearns, Ph. D., a member of the Board of Trustees of the Academy, read a memorial and resolutions eulogistic of the late B. B. Redding.

C. D. Gibbes, C. E., Curator of Mineralogy at the Academy, read a paper giving the exact measurements and a description of the prehistoric footsteps in the sandstone quarry at Carson. It was also stated that two more footprints had been found; also 18 smaller ones, shaped like a dog's track, which may have been made by a hyena or some large animal of that genus. Near these was found the shore of an ancient lake, 15 inches in 30 ft. being the inclination. The reader said these tracks had been impressed ages ago in a clay deposit three to five inches in thickness, through which the man and mammoth press, leaving a slight imprint on the sand below, the latter now being a compact sandstone. But no toes, pads or claws are to be seen in any tracks so uncovered. Mr. Gibbes thought the so-called man's footprints were really what people supposed them. His paper dealt, however, more with the size, location and relative position of the footprints than with their supposed origin. The stereopticon, managed by Prof. James, was brought into requisition to illustrate the paper.

The Black Bear Quartz mining company paid a dividend of 30 cents a share on the 10th instant, aggregating $9,000. The total of dividends to date is $858,500.

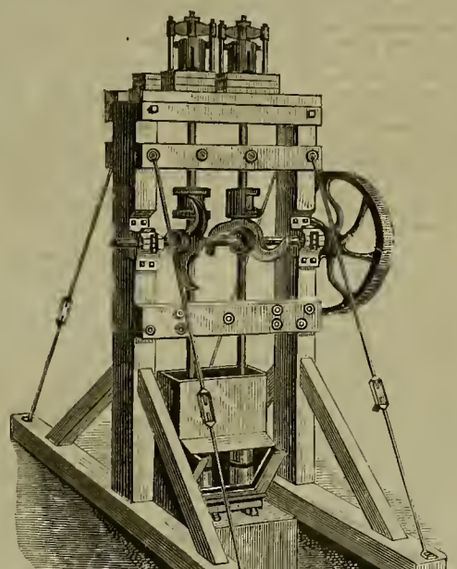
The Ruby mine, Sierra county, lately washed out $700 from 75 carloads of gravel.

Assessment Work.

The United States Mining Laws provide that in order to hold a mining claim, a certain amount of work shall be done on it each year, or improvements made, otherwise it shall be forfeited, and be subject to re-location by any one who comes along after said forfeiture. The law is a good one, and prevents one or two people holding on to a whole lot of claims for an indefinite time. As to what are and what are not legitimate expenses to be charged under the head of assessment work, there seems to be some doubt. A man in Eureka wrote to the Secretary of the Interior on the subject, and received in reply a letter which explains itself, and which is to the following effect:

I am in receipt of your letter of the 8th instant, in which you ask if the expenses incurred in traveling to a mining camp, and locating and recording a mining claim at the time of discovery, can be properly charged to account of assessment work.

In reply, I have to answer your question in the negative. The expenditures required by law must be paid upon the claim itself, or other improvements used or to be used for or in connection with the development of the mine. The expenses incurred in traveling to, locating and recording a mine, cannot be taken into consideration in estimating the value of expenditures made on the claim.



DAY'S PROSPECTING QUARTZ MILL.

Mining Accident.—Two men at work in the tunnel of the Blue Lead mine, near Willow valley, Nevada, cut through into some old works, and a large volume of water swept in upon them. They were both washed out of the tunnel by the force of the water. One of the men, named Martin Mitchell, was severely bruised about the face and head. The other escaped unhurt.—*Nev. Herald.*

The largest locomotive ever built has just been completed at Paterson, N. J., for the Central Pacific road, and 24 more will be constructed. Their weight will be 62 tons each, and they have eight driving wheels.

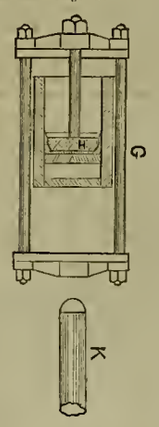
Miners are still employed in taking low-grade ores from the old workings of the Yellow Jacket mine. No work is being done at the new shaft. The water rises about an inch a day.

A Prospecting Quartz Mill.

In the Mining and Scientific Press of May 6th, we made a note of a new attachment to quartz mill stamps, which was patented through the office of the Mining and Scientific Press Patent Agency. We now submit to the notice of our readers an illustration and description of a two-stamp mill with this attachment applied to it. The machine is exhibited at the Mechanics' fair, and the manufacturers name it "The Developer."

To this mill is applied the patented "vacuum attachment," the object of which is to give a quick and heavy blow with a light stamp. Its manner of effecting this will be understood by reference to Fig. 2, showing the attachment in section. It consists of a cast-iron cylinder, closed at its bottom and open at its top to the atmosphere. In this cylinder is fitted a piston, marked *H*, formed as an ordinary pump piston, with a cup leather packing which is kept moist with oil. To this piston is connected a crosshead, to which are attached side rods, *G*, extending downwards outside of the cylinder, which are again connected by a lower crosshar.

Fig. 2.



Its operation is as follows: The stamp stem, *K*, is raised one-half of its required lift by the partial revolution of the cam. It then comes in contact with the lower cross-bar and raises the air-tight piston, *H*, and thus creates a vacuum between the under side of the piston and the interior of the base of the cylinder. The stamp is now sustaining the weight of a column of the atmosphere equal to the area of the piston. The continued revolution of the cam releases the tappet and the stamp descends with a force and velocity due to its actual weight and that also of the column of the atmosphere added to it.

An inspection and thorough understanding of this device, governed as it is by the same principle as the common suction pump, will show practical mill men that the inventor has succeeded in giving a quick and heavy blow with a light stamp. Many and various have been the devices tried for increasing the effective force or blow of a stamp, but they have failed to be of lasting practical benefit, mainly in consequence of the lack of durability of the material employed as a spring. In this device the inventor claims that by taking advantage of one of the common forces of nature, the weight of the atmosphere, he succeeds in applying a permanent and lasting force to the weight of a stamp.

This mill, "The Developer," is specially designed to meet the requirements of the miner and prospector who does not wish to make a very large outlay on his mine until he is satisfied he has a mine that will repay the outlay for large and expensive works. With this object in view, it is so constructed as to be low in price, cost little to transport, and can be readily set up for operation. Its shipping weight is 2,000 lbs.

The inventor states that the stamps in this mill each strike a blow equal to a 500-lb. stamp, and can be run up to 150 drops per minute, or slower if desired. The drop is six inches. The shoes and dies are six inches in diameter, and it is estimated to crush and pass through a No. 6 slot screen, or No. 40 wire mesh, four tons of ordinary quartz per mill-day. A complete mill costs about $300 without motive power.

Mill owners who may desire to increase the crushing capacity of their present stamps, by increasing their speed and force of blow, will be furnished with this attachment complete and ready to attach to their batteries. Any further information desired can be obtained by addressing the inventor, James Day, Atlas Iron Works, 133 to 137 Beale St., S. F., Cal.

Bidwell Bar, at one time a flourishing town, and where the Butte *Record* was started in 1853, now numbers but 30 persons, men, women and children. At one time it contained several thousand inhabitants.

Lieut. Flipper, dismissed from the United States army, has been appointed a captain in Mexico.

CORRESPONDENCE.

We admit, unendorsed, opinions of correspondents.—Eds.

Intra-Mercurial Planets.

Prof. Balfaur Stewart's and Leverrier's Hypotheses.

EDITORS PRESS:—Whsther or not my compntation in your columns last August, from Levsrrier's 33.0225 days sidereal periods indicative of synodical periods, varying from 36 2836415 days to 36.3031765 days, and a transit of Vulcan, Octohsr 12th or 13, 1881, may have been visihle in some part of the glohs, although Major Bander's and my own observations at tbs State capital, and thoss of W. R. Frink, Esq., at Salt Laks City, with a four-inch aperture achromatic telescope, sufficed to show that none of the spots ohsrved hsrs, or in Salt Lake City, were planetary. Whether or not ths transit may havs been visibls in anothsr hsmisphere, cannot now be detsrmined, although a very careful scrutiny at all the principal observatories might give indications of it somewhere. Bnt unlsss attention had been specially directed to that ohject (of which I have heard no reports), one example from the interesting records of the Ksw obssrvatory, England, is sufficient to show how long such a matter may he ovsrlooked, although ths evidence may hs thsre. What I refer to is a parallel case, desply intsresting in itself, and, if taken in connection with one of Lsverrisr's formulas, almost conclusivs of an approximate intra-Marcurial sidsrsal psriod hetween 24 nays and 24.25 days. It appears that at the last meeting of ths British Association for the Advancsmsnt of Science, Prof, Baliour Stswart, LL. D., F. R. S., the distinguished English philosopher, drew up an interesting papsr, in section A, "On ths Possihility of ths Existence of intra-Marcurial Planets." Hs derived ths inference from the obssrvation of solar spots at the Ksw obssrvatory sincs January 1, 1882, "that thsre was evidence of a certain inequality corresponding in psriod to 24.011 days, which may hs caussd hy an intra-Mercurial planet, of period 24.011 days. Such planet would have the following synodic psriods in relation to the known planets: 33.025 days to Msrcnry; 26 884 days to Venus; and 24.145 days to Jupiter;" and obssrvations accordsd with "a very prominent inequality, 32.955 days; very prominent, 26.871 days; less prominent, 24.142 days."

The paper was fully rsported in *Nature*, of Sept. 15, 1881, which I only recently had an opportunity of seeing. Ths subsequent numhers do not appsar to make any further refsrences to it, although quite a discussion might have besn looked for upon such a discovsry. That the influencs of Jupiter, at such a distance from the Sun, compared with Mercury or Venus, should be mnch less, so that Jupitsr's influencs wonld perhaps he only apparsnt to the hsst telescopes, is what might hs expscted. But the first point that struck me, although not referrsd to by Prof. Stswart, is the nsar approximation of psriods of 24.011 days to Leverrisr's 24.25 day period, refsrred to hy M. Gaillot, August, 1878, as possibly fitting Professor Watson's obssrvatiou of a supposed intra-Msrcurial planst, at 2° 9′ from the Sun, during the total eclipse seen at Wyoming, July 29, 1878. And in that connection a discussion of thsir relative merits, as wsll as M. Gaillot's interpretation of the Lsverrisr formula, would be exactly in order. Although Prof. Stewart remarks that "the tsst of his inference is not yst complete," it is quite prohable that he will havs it complets by the next meeting of the Britsh associstion, now nearly due, I believe, but meanwhile the collateral svidence I allnde to is worth noting.

Scisnce can nsver err, although we may all more or less he liahle to crr in unraveling it or applying it. Even Lsvsrrier himsslf was apparsntly in error, in Marcb, 1877, rcspecting the transit he directsd astronomers to look for, which failed to occnr; and yet if that was due to a want of knowledgs of Mr. Wright's transit of Octohsr 24, 1876, instead of heing an error in principle, as I pointsd out last yesr, it was rather a confirmation of approximats 33 0225 days sidereal periods, for one of tbe intra-Mercurial planets, and even that seems to have a slight rslativs connection with Prof. Stswart's observed inequality of sun spots at periods of 32-.955 days. It is quits probable that Lsverrisr's various hypothess were partially hased on sunspot inequalities; we cannot do hetter, therefore, than collect all ths data which may prove factors or elements in ultimate conclusions. The recorded observations of numerous transits during the last 130 years, will douhtless lead to a propsr classification, so that the difficulty of reconciling tbem all as one intra-Mercurial planet will no longer harass us. But a sidereal period approximating 24.011 days, or Gaillot's 24.25 days, which necessarily approximates 26 days for the aynodical or apparent revolutions, will douhtlesa lead to resolving some mean period which will reconcile certain transits as one group. The 26-day period I examined pretty thoroughly in 1878, when M. Gaillot hroached that hypothesis. I wish to ahow, therefore, the respective periods Gaillot's figures give, and how near they can he adapted to accord with Prof. Watson's hypothesis, that the planet was 2° 9′ from superior conjunction, and how near they can be adapted to Gaillot's idea that Leverrisr's formula requirsd the planet to he in the infsrior part of the orhit.

Then I propose to examins Prof. Stewart's hypothesia in the same manner. There is, of course, no insurmountable difficnlty in adapting the psriod to either position—referred simply to ths interval from Jan. 1, 1750—hut ws may, I think, be safe in assuming that Prof. Watson must have seen the planet in the supsrior part of the orbit, unless he was entirely mistaken (which is utterly improbahle) about the apparent distance being 2° 9′ only, for at that distance, the planet conld only he a fins crescent if so little past infsrior conjnnction, and bsfore going into dstails, it is worth noting, in a simple manner, the relative differsnce of Prof. Watsou's and Gaillot's hypothesss in relation to the formula of Lsverrier. The formula adopts ths intsrval from January 1, 1750, which, carrisd on to Prof. Watson's observance lats in the day, July 29, 1878, makes about 46,962½ days. Now, then, ths position of 2° 9′ from superior conjnnction—supposing ths elongation, 90°, in the planst's orhit from the Sun is apparently 10°, as seen from onr Earth, at about five times the distanes of the planet from tbs Sun—would hs ahont 165° in its orhit from inferior conjunction, or 15° from supsrior conjunction. Fiftsen degrsss is, of conrss, 1-24 of 360°, so that 165° is eqnivalent to 11-24 of a revolution; and to approximate 26 days requires 1,808 11-24 revolutions, therefore, of 25.96825104 days esch, and 11.90211506 days remainder, whils if we divide the 46,962½ days hy 1,808 1 24, we sball ohtain the psriod and position requirsd to accord with M. Gaillot's hypothesis, although not at all what either of his terms give ns, whicb we will examine hersaftsr. The period we now ohtain is 25.9742355 days for sach revolution, and 1.08226 days remainder. The diffsrsnce hstween tbe two psriods is about 8 minntes 37 seconds sach. These examples ars sufficient to show that thsre is nothing insurmountable in reconciling the formnla to the required position, while ws shall presently see that M. Gaillot's figures will not accord with either required position. Let us now sxamine them, hut be very carefnl not to touch the 26 days exactly for either the intsrval from January 1, 1750, or from Lescarhanlt's observance of transit, March 26, 1859, which makes 7,065¼ days—for ths long interval puts the planet at one elongation, or say at 10° from the Sun, and the other interval puts the planet at the othsr slongation, which is, of course, the farthest point the planst is ever sesn from the Sun. The learned Frenchman of course did not mean us to take the 26 days exactly, hut the elements he gave us, hut hsing called about 26 days, was rather misleading to ordinary students, who wers hound to find out the rather awkward results. M. Gaillot (ses *Nature*, Aug. 22, 1878) stated that the diurnal motion was 14.8462°, and the sidersal revolution 24.25 days, but as thess two terms do not accord, thsy must he examined separatsly.

First, If ws divide ths orhit, 360°, by 14.8462° it gives us 24.24862928 days, not 24.25 days, and the synodical period would he 25.9729903466 days. The planet's position wonld hs about 46° 12′ in its orhit past inferior conjnnction, and apparently about 8° 24′ from the Sun, and the assumption, as before, of 10° for the whole elongation, 46°, etc., in tims would hs equivalsnt to about 3½ days. It mnst bs ohvions that neither of thoss equivalent tsrms would accord with the position assigned hy Prof. Watson at 2° 9′ from the Sun; but something approximats wonld perhaps afford the only chance for sesing the planet in the inferior part of the orhit, as M. Gaillot regarded that the formula required.

Second, If we assume the sidereal period at 24.25 days, then the diurnal motion is 14.8453-608247°, which, multiplisd by the interval 46,962½ days, gives us 697,175.2659625°, and requires 1,936.597961 sidersal rsvolutions. Tuen, to ohtain the synodical diffsrence, we first take the tropical ysar of our glohs, 365 days 5 hours 48 minutes 46 seconds, as detsrmined hy Prof. Newcomb, and divide ths interval 46,962½ days, which gives us 128.5790665 revolutions of our globe, which in dsgrees equals 46,288.4639410°, which, suhtracted from the planst's motion, leaves 650,886.8020225° as tbe apparent or synodical motion observed from the Earth. Dividing that hy 360° gives us 1,808.0188945 apparent or synodical revolutions. Then dividing the 46,962½ days by 1,808, etc., we obtain each synodical revolution, or 25 974562624 days. The value of the fractional revolution, .0188945, is less than half a day, or nearly .491 days, but mors accurately .4907763735 days, or 11 hours 46 minutes 43 seconds past the inferior conjunction.

Of course such a position, only 6.8° of the planet's orhit, and apparently less than one degree, would he sntirely too close to the Sun to accord with Prof. Watson's observation, bssides being invisihls.

It appsars to hs impossihle, therefors, to adopt exactly eithsr of M. Gaillot's terms, neither 24.25 days for ths aidereal period, or 14.8462° for the diurnal motion. But we have already seen that synodical periods of 25.96825104 days would accord with the position 2° 9′ from superior conjunction, where Prof. Watson believed he observed it, or to accord with M. Gaillot's idea that it was a little past its inferior conjunction, then synodical periods of 25 9742355 days would meet the condition of its being 2° 9′ from the Sun.

It remains now to examine what results can be ohtained from Prof. Stewart's hypotheais, indicating intra-Mercurial aidereal periods of ahout 24.011 days, and where it would place the planet Prof. Watson observed, July 29, 1878, adopting the same interval from January 1, 1750, as bsfore. The following ontline will explain the resnlts: 360° dividsd hy 24.011 days gives us 14 99312818° for the planst's diurnal motion, which, multiplisd by 46,962½ days, givss us 704,114.78215325°, from which we snbtract the Esrth's motion as hefore, 46,288.463941°, the rssidue is 657,826.318213°, which, dividsd hy 360°, gives us 1,827.29533 synodical rsvolutions; using that to divide the intsrval, 46,962½ days, we ohtain the synodical period of 25.700553 days. The fractional revolntion .29533 is equal to 106° 19′ 17″, or 7 days 14 hours 10 minutes. Now, while that wonld undouhtedly put the planet in ths supsrior part of its orhit, it would hs nearly 60° from whers Prof. Watson saw it, and apparently hut little past its elongation, or from 9° to 10° from the Sun, instead of 2° 9′, as requirsd.

It is clear, however, that a very slight modification of Prof. Stewart's infersntial sidereal period, 24.011 days, would give us exact accord with Prof. Watson's observation, and the evidence would be rather in favor of 1,827 11-24 revolutions, obtainsd from such a solar tast, tban 1,808 11-24 periods, the result obtained by an approximate relation to the Lsverrier-Gaillot formnla; 1,827 11-24 revolutions would give ut 25 698260334253 days for the synodical periods, and a remainder of 11.77836931986 days; rsducsd to clock time, that would givs us 25 days 16 hours 45 minutes 29.7 seconds for esch apparent rsvolution, and 11 days 18 hours 40 minutss 51.11 ssconds for the rsmainder.

I bad intsnded reviewing the relative connection of tbe suppossd transits obssrved hy Lichtenhurg, Nov. 19, 1762; Hoffman, May 10 or 11, 1764; Fritsch, Oct. 10, 1802; Stark, Oct. 9, 1819; Da Cuppi, Oct. 2, 1839; Scott, ahout Jnns 28, 1847; Sidebottom, March 12, 1849; Rittsr and Schmidt, June 11, 1855; Lsscarbault, March 26, 1859; Lnmmis, March 20, 1862; Wsbsr, April 4, 1876; Wright, Oct. 24, 1876; Watson's approximate conjunction, July 29, 1878: the probahle transit of Octoher 12-13, 1881, and Prof. Stswart's and M. Gaillot's hypothesis; hut as my letter has alrsady extended to great length, and the consideration of the intervals involvsd, would embrace the inquiry regarding the displacemsnt of ths nodss, which might or might not he uniform with the displacement of seven days in three years, obsservable between Lsscarhault's and Lummis' obssrvations; and such a revisw should inclnds, perhaps, a complete classification of the ssvsral obsservations. However important thsss and other considerations may he, it would bs altogether too tedions at prssant to prsss these considerations furthsr, neverthsless, thsy are suggsstive, and I hops that some of your readers may taks them up, and hy the time the Lick obssrvatory has its tslescops mountsd, California may, perhaps, he able to do some very effective ssrvice regsrding the re-discovery of Vulcanites. A. F. GODDARD.

Sacramsnto, Ang. 6, 1882.

MINING IN CORNWALL.—The report of Mr. R. J. Frscheville, Inspector of Minss for the districts of Cornwall, Devonshire, Dorsstshire, and part of Somersetshire, for ths ysar 1881, has been issusd, and deals with a decidedly improved state of things, when compared with his rsport for the preceding 12 months. In his general remarks, Mr. Frechsville says the steady advance of the tin standards, during the year, from 88s. on the 1st of Jannary to 106s. on the 31st of Decsmhsr has rendersd the year 1881 a tolerahly prospsrons ons in his district. Several old minss have hesn rsopened, and new onss started, so that there is no lack of employmsnt for labor, and the working miner participatss in ths improved state of affairs, as he can now sasily earn over £4 per month. In nsing the boring machine a rapid means of clearing the ends of ths headings of smoks and noxious fumes has hesn introduced at Carn Brsa by Mr. Teague, Jr. At Dolcoath, the despest mine in Cornwall, 364 fathoms hslow adit, or ovsr 390 fathoms from surface, the telephone has been successsfnlly introduced, the men at the bottom of ths mine now heing ahle to communicate immediately with ths surface. The report shows that ths total numher employed underground in the Cornish mines in that year was 8 308; ahovs ground, 7,263; making a total of 15,571. Compared with 1880, thsre is an increass ovsr all his district of 2,201 psrsons, or ovsr 13⅞; and, compared with 1879, an incrsase of 4,096 persons, or over 28⅞.

THE OGDEN IRON FURNACE.—The Salt Lake *Tribune* says: After numerous trials and vexatious dslays, the Ogden Iron Works has at last produced a few tons of pig iron. Ths furnace was fired up last Saturday, and on Monday ths first flow of iron was made, filling 19 molds, casting that numhsr of hars of pig iron. Ths works ars now under the management of Richmond Jones, who has had large experisnce in the production of mschantable iron in Pennsylvania. The citizens of Ogden are juhilant over the success of this blast, and, ahould the works prove successful—which there seems to he no douht—Utah will become a great producer of iron goods. With the vast heds of coal and deposits of iron ores found in varions parts of this Territory, the only thing in the way of great iron industries is the question of freight tariffs.

THE receipt of the official announcement that the authorities at Washington had declined to relieve the Strathairly of the fine of $11,500 imposed on her for hringing an excess of coolies to this port, leavea nothing for the authorities here to do but to collect the fine.

Tornadoes and their Causes.

The immunity from tornadoss which ws enjoy in California is oftsn a snhject for gratulation. Ws read, witb grief and sympathy, the accounts of the destructive winds which lay waste citiss and farms in the great csntral arsas of the country and hring many psopls to untimely gravss. Why are we free from tbess visitations? It is undouhtsdly hecause of ths protection afforded onr coast hy the lofty mountain ranges to tbe east of us and forming tbe westsrn boundary of the Mississippi vallsy. As the Sierras stop the clouds of vapor and causs tbs precipitation of rain and snow, which givss us a well-watsred rsgion, so the Rocky mountains hedge in ths air currants and free us from the cyclone and the tornado. This fact clearly appears from an sssay on "Tornadoss and their Causes," which T. B. Maury has written for the Septsmber numhsr of the *North American Review*. Ws shall abstract enough of Mr. Maury's statsment to show the reasons why the great Mississippi vslley is snhject to the tornado, and hy inferencs, onr freedom from its ruin.

The Mississippi valley is a grand continsntal highway in summer for the vapor-laden tradewinds whioh, sntering the Gulf of Mexico, ars arrsated in their westward movement, and mnst find an outlst to tbe northward. Morsover, the anti-trades, which form the "equatorial" current, are simnltansonsly pressing northward, espscially at that ssason, as an nppsr atmospheric force, and aftsr lsaving the tropics stream away to ths middls latitudes with a velocity which, if estimatsd hy ths observed velocity of the cirrus, cirro-stratus, and cirro-cumulus clouds, rsaches, at timss, 150 milss per hour. As the Rsv. Clemsnt Ley, the Englisb meteorologist, has obsarved, it is notbing uncommon to ses tbese "upper-currsnt clouds" moving from the sonthwest at ths rate of 100 milss an hour. Considering, then, the geographical rslation of the Mississippi valley to the great equatorial current which glidss over it, gradnally descendiog toward the surface of the sarth, and which is undsrrun in summsr by the trade-wind currsnt diverted northward from the Gulf, it is not rsmarkable that our "central Wsst," lying also within reacb of ths polar winds from the Rocky mountain platsaus, should bs the scens of the most tsrrific aarial disturhances witnessed on any part of the glohs. That the existencs of an upper current from the tropics, flowing in an northeasterly direction in summsr over the Mississippi valley, is not merely hypothstical, a glance at ths wind obsservations mads hy the U. S. Signal Service at Piks's psak, more than 14,000 fest above sea level, will show. The rssult of these observations for 1874, "agrees," as Dr. Wosikof statss, "with the gensrally entertained opinion as to the prsvailing direction of the upper atmospheric currsnt from the west-southwest, in ths middle and northern latitudes." For the five years, 1875 to 1879, ths prevailing winds at this high mountain station, as given in the Signal Service annual reports, were both in spring and summer from ths southwsst, with a slight deviation in the summer or 1876; and during May aod Juns (the chisf tornado months) of 1880 and 1881, the preponderancs of winds on the Psak, as the Signal Servics monthly msans show, was in favor of the southwest. Wsre this lofty lookont station in Missouri, instead of in Colorado, ths indications it affords of the swesp of the upper (or "return") trade current would in all probsbility hs still more conclnsive.

This vast atmospheric movement, the intensity of which augmsnts as tbe summer solstics approsches, has apparently much to do with the origination of tornadoss. Being an outflow of ascended air from tbe equatorial calm helt, it advances northward with the vernal advance of tbe "thermal equator," which, hy June, has followed the sun from "tbe line," nearly, if not quite, up to the lower Florida parallels. This movement may not bs a stesdy *"Gulf stream in the air,"* as some have regardsd it, hut is rather to he viewed as a sustained series of pnlsations from ths medial lins (ths movahle "thermal equator"), toward which the ssrvice winds blow, and ovsr which the air they bring must ascend and hs massed, and, as it moves nortbward through high regions of ths atmosphers, continually descends towards the earth's surface.

TO TEMPER A TOOL.—Having brightened its surface, melt sufficient lead to immerss the cutting part of ths tool, into which place it for a few minutes, until it hecomes hot enough to melt tallow, with which ruh it, and then replacs it in the melting lead until it bscomes of a straw color. Sbould you chancs to let it remain until it turns blus, rub it with tallow, and let it cool; then repsat tbe process. Should you, after this operation, find ths tool too soft, rspsat the process without nsing tallow, and when at the temperatnre ahove directed.

A TRIUMPH OF SCIENCE.—The liquid of the blood is colorlesa, and its red appearance is dne to the presence of innumerable little bodies floating in it, which are so small that three millions of them are contained in a drop which may he suspended on the point of a needle. These corpuscles are sacs filled with a compound snbstance, and it has been ascertained what hoth the film of the saos and their contents are composed of. Each one of these little bodies has its own life. They are formed, and grow, and die; and it is calcnlated that nearly twenty milliona perish at every pulsation of the heart.

MECHANICAL PROGRESS.

Labor as Value to Material.

Thie might be a title to a long disquisitioo, hot wa propose only one simple example. Many years ago ons of our school books told what an inmeose valne was imparted to a pound of iron from the ore that was turoed into watch sprioge. The question came up in ths youthful mind, "Why, if one pound of iroo could be made to yield snch a large amount in watch springs, svery poond of iroo should not ho also made ioto watch springs." It would hs onecessary to say that the watch-spring notion was more fanciful than real, as the statement gave no idea of the waste of material io the conversion of the iroo to steel aod in its nfter manipnlations.

But a simple cooversion of a bit of iron—or rather steel—from the har to nse may serve to show how mooh labor cao do to eohance the valus of material.

Before the writer lies a piece of thrse-oighths of an inch sqoars steel io various forms. In one it is ooly three-eighths sqoare steel. A single blow of a drop hammer, which is a punch, on a die turns this piece of square stoel into a hollow square about ooe and a half inobes long by three-eighths of an inoh wide. Another blow forms it into a boat-shnped pieco hardly any longor or wider, and still another blow briogs it oot into the shape of a shottle for a sewing machine. It is thsn compressed nnder a heavy machioe, aod is ready for finishing, which is dooe on a bnff wheel. With some drilliog and the attachmeot of n spring, the piece of soft stool, weighing only one onnce originally, is mnde ioto a shuttle that sells nt whnlesale at 20 cents.

Tho original value of the materinl to form this shnttle was nbout one-half a cent, its finished vnlue is 20 cents, and its progrese from unshapsd material to valnable use is scarcely less interesting than the geometrioal ratio of its valne as it passed through its processes to the finished prodoct.—*Boston Journal of Commerce.*

Primitive and Modern Inventions.

While it is true that the tendency is, or should be, from complex machiuery to simplsr forms, tho fact still remaine that all varieties of lnbor-seving machinery of the preeent day are lnrge compared with the primitive forms. We do not meau by this that they nre nnwieldy or difficult to mnnage, but one is apt to be etruck with the comperative iocrease of size in modern machines, when placed by the side of the implemeots originelly used for the same purposes.

The primitive form of grinding grain was with the pestle and mortar. Compare this with the ponderous millstones of the present day, and the disparity is very great indeed. The tendenoy of invention is to simplify and lighten. It will certninly hear it in the case of the millstone. The thrashiog mnchine ie another instance. A full-grown machine is from 12 to 18 ft. long nnd from five to eight feet high, many of them reqniring 10 horsee with a snitable power to operate. The primitive implement was eimply two pieces of hard wood joined together loosely, one of them heing used as a handle, while the other was impelled against the soettered straw. The sewing machine of 20 years ago was a clumsy affair compared with the present neet and light machines; still, the iron in any of the present-day machines would make 30,000 needles nsed in hand work. The planer is a machine of three or four tons weight, and a giant beside the little plane.

So maoy others might he mentioned, all of lerge structure, gredually being lessened, so that we may expect a time in the near future when perfected machioes will egain more nearly approach the size originally used, and he endowed with the vigor and capacity of those in use.

Edge-Tools.

All cnttiog and piercing edge-tools operate on the priociple of the wedge. A hrad-awl furnishes an example which all can readily understand. The cutting edge of the awl severs the fibers of wood as the instrument enters, and the particles are compressed into a emaller compass, in the same manner as when a piece of wood is separated by a wedge. A chisel is a wedge in one sense; nnd an ax, drawing knife, or jackknife is also a wedge. When a keen-edged razor is made to clip a hair or to remove a man's beard, it operates on the priociple of the wedge.

Every intelligent mechanic understands that when a wedge is dressed out smoothly, it may he driven in with much less force than if its surface were left jagged and rough. The same idea holds good with respect to edge-tools. If the cnttiog edge he ground and whet to as fine an edge as may be practicable with a fine-gritted whet-stone, and if the surface hack of the cutting edge be ground smooth and true, and polished neatly, so that one can discern the color of his eyes by means of the polished surface, the tool will enter whatever is to he cut by the application of much less force than if the surfaces were left as rough as they usually are when the tool leaves the grindstone. All edge-tools, such as axes, chisels end planes, that are operated with a *crushing* instead of a *drawing* etroke, ehould be polished neatly clear to the cutting edge, to facilitate their entrance into the eubstance to he cut.

American Progress.

The methods practiced io this country for the manufaoture of iron and steel have been so meterially improved of late that we cao oow boast of a superiority over ths entire world, except in a few particnlars whers special featuree have been adopted to meet certain cooditions. For mnoy years it was thought perfection, or ao approximtioo to it, oonld oot be attained with the orea and metals of this conntry, bnt now sven indifferent metals are so maoipulated as to produce as good steel as has ever been manufactured, and the appliaocee used to prodnce these results have been brought to such a state of perfection as to not only greatly oheapen the lnbor and hasten ths operntion, but to almost do the thioking iovolved io the process.

Eoglaod, finding that Americe is likely to supply herself entirely with home product, has beeo stimulated to greater exertion, aod proposes oow to surpass her former exploits io the quality and cost of her own prodnotions. As, for instanoe, she expects to he able to increase tho service valoe of her steels four-tenths, decrease the cost of her cutlery ooe-third, aod, with the hope that Amerion may yet see the folly of a protective tariff, to rebuild her trade io this couotry to the eame proportioo which she once commanded.

But this is n vain delosion. No mnttor how well or cheaply England may he able to prodoce iron nnd steel, American indostry and American genins will never permit British labor to lead in this conntry. As well might they expeot to furnish us with a mooo. Bot it can be snid without a bonst thnt if the same progress is made for 10 years that hae beeo made heretofore io this coontry, Englnnd will fiod herself relying upon America for a larger proportion of her necessitiee than has already beeo the case. Hoe printing presses, Yankee clooks and sewing machines will be but a tithe of the Americnn manufactnred articles which Europe caunot do without.—*American Manufacturer.*

MAKING BELTS.—A mechnoio gives the following diiections for managing belts. He says: "I have for the last 25 years, on every Saturday evening, turned the inner side of my engine-helt outside, let the engine rnn slowly, nnd washed the belt well with warm water and soda, applied with cotton waste. Next I take a piece of sheet-metal and scrape the belt well, then wnsh with clenn warm water and dry off. I collect the waste oil from the shafting and apply as much of it to the belt as possible. The washing mnst be done as qnickly es possible, so as not to dissolve the glued parts. I let the belt stand on the pulleys till Monday, then give another scraping and turn the belt as before. I keep the polleys very clean. I have long heen surprised at the economy I have effected with very little trouble. I have not bought a new belt for the last 10 years. There is an engine neer me 14 inches by 36 inches (mine is 12 inches by 36 inches). I have nearly double the shafting and belt, and my neighbor cannot run with less than 38 lbs. of steam when all the helts are on the loose pulleys. Mioe will run at full speed with five pounds."

EFFECTS OF COMPRESSION ON THE HARDNESS OF STEEL.—Mr. Lan reports that at the works of Saint Jacques, at Montlucon, France, the method of compressing oast steel has been applied on a large scale. The process consists of submitting the molten metel to the action of a hydranlic press which cao exert a pressnre of from ahout 15,000 to 22,000 pounds per square inch, the pressure heing kept up until the ingot has solidified and cooled. The reeult of this method is similar to that obtained by M. Clemandot'e process, a brief account of which was given a short time since. It ie said that numerous analyses, made with a view of ascertaining the quantity of carhon, heve shown that the quantity of combined carhon in proportion to the total quantity of carbon is greater in the compressed than in the ordinary steel.

SINGULAR PROPERTY IN STEEL.—It is well known that a steel that is very flexible when cold often breaks at the hlue annealing temperature. It has generally been considered that the purer the iron is the less subject it becomes to thie defect; hut the workmen of the Ural mountains, who use iron of remarkahle pnrity, have often obeerved the same fact. Mr. Adamson has found thet the metal becomes powdery at a temperature hetween 260° and 370° C., (500° and 698° Fah.), or the temperature at which willow twigs take fire. This phenomenon seeme to explain a large nnmher of accidents, as for example, the breaking of tires under the action of hrakes and the fracture of riveted molds and of machine arhors which hecome heated by friction.—*Ann. du Gen. Civ.*

HEAVY MODERN MACHINERY.—A mass of melted iron of a ton weight was unknown before the Christien era. Now those in oast iron up to 150 tons, in wrought iron to 40 tons, and in steel or bronze to 25 tons, are made in aoy desired form, and turned or hored with the most perfect accuracy. Two years ago I saw the largest lathe in England, which swings 22 ft., and will take in a ehaft 45 ft. long. Six months ago I saw one in this country which ewings 80 ft., and will take in a shaft of 50 ft. There are planers which will plane iron 50 ft. in length; others of 18 ft. in width; others of 14 ft. in hight, taking off metal ehavinge of two and a half inchee in width and a quarter thick.—*Hon. W. J. McAlpine.*

SCIENTIFIC PROGRESS.

What is a Tear?

The principal elcment of a tear is water; this water, upon dissolotion, contaios a few hondredth parts of the substance called mucns, and a small portion of ealt, of soda, of phosphate of lime, aod of phosphnte of soda. It is the snlt and the sodn that give to tears thnt peculiar savor, which earned for tenrs the peculinr epithat of "ealt" at the hnnde of the Greek poets, and thnt of "bitter" nt ours; "salt" is, however, the more correct term of the two. When a tear dries, the water evaporates, eod leevee behind it a depoeit of the saline iogredieots; these amalgmate, and, as eeeo through the microscope, array themselves elong orossed linee, which look like dimioutive fish bones. Tears nre secreted hy a glsod called the "lachrymal glaod," which is sitoated above the eyeball, and underneath the upper eyelid on the side oearest the temple. Six or seven exceedingly fine chaooele flow from it on the noder eorfnce of the eyelid, disohnrging their oootents a little nhove the delicnte cartilage which sopporte the lid. It is these ohaooels or canals that carry the tenrs ioto the sye. Bot teare do oot flow ooly at certain moments and under certain cirournstnnces, ae might he supposed; their flow is continoous; all day and all night, although lese abundantly during sleep; they trickle softly from their slender sluices, and spread glisteoing over the sorface of the pnpil and eyehall, giving them that bright ennmel aod limpid look whioh is one of the chnracteristio signs of health. It is the ceaseless movement aod cootraction of the eyelids that effect the regular spreading of the tenrs, aod the flow of these has need to be constnntly reoewed io the way just meotioned, becnnse tenrs not only evaporate after a few eeconde, but nlso are oarried away throngh two little draine called "lachrymel points," and situated in the corner of the eye near the nose. Thus all tears, after leaving the eyelids, flow into the nostrils, and if the reader will assure himself of this, he has only to notice, unpoetic as the fact may be, that a person after oryiog much ie always obliged to make a two-fold use of his or her pocket-handkerchief.—*Chamber's Journal.*

Sunbeams.

The greatest of physical paradoxes is the sunbeam. It is the most potent and versatile foroe we have, and yet it behaves itself like the gentlest and most accommodating. Nothing can fall more softly and more silently upon the earth than the rays of our great luminary—not even the feathery flakes of snow, which thread their way through the atmosphere as if they were too filmy to yield to the demands of gravity like grosser thiogs. The moet delicate slip of gold leaf, exposed as a target to the sun's shafts, is not stirred to the extent of a hair, though an infant'e faintest breath would set it into tremulous motion. The tenderest of human organs, the apple of the eye, though pierced and buffeted each day hy thousands of sunbeams, suffars no pein during the process, bnt rejoices in their sweetness, and blesses the useful light. Yet a few of those rays, insinuating themselves into a mass of iron, like the Britannia tubnlar bridge, will compel the closely-knit particles to separate, and will move the whole enormous fabric with as much ease as a giant would etir a etraw. The play of those beams upon our sheets of water lifts up layer after layer into the atmosphere, and hoists whole rivers from their beds, only to drop them again in snows upon the hills, or in fattening ehowers upon the plains. Let hut the air drink in a little more sunshine at one place than another, and out of it eprioge the tempest or the hurricane, wflich desolatee a whole region in its lunatic wrath. The marvel is, that a power which is capehle of assuming such a diversity of forms, and of producing eoch stupendous results, should come to us in so gentle, so peaceful and so uopretentious a guise.—*British Quarterly Review.*

THE PASSIVITY OF IRON has heen studied under new conditione by M. Bibart, who considers that it is not produced by a layer of insoluble sub-nitrate, as some physicists have thought, since the previous action of nitric acid is not necessary. Still less ie it due to a formation of hioxide of nitrogen. It is prodnced hy any cause which tends to oxidize iron, and destroyed hy any ceuse which tends to deoxidize it. It is due, then, either to a layer of oxide or a layer of oxygen. The oxides formed on the surface may preserve it hy their very presence, furnishing a sort of unattackable varnish, or they may preserve it like platinum, liberating, on the denuded parts, a protective layer of oxygen. The passivity of iron from contact of platinum seems to be produced at first hy the platinum layer of oxygen condeneed on a simple surface (e simple ehock destroys it). But hy degrees a layer of oxide is formed, and the iron then loses its passivity much lese reedily than before.

HEATED PLASTER OF PARIS. —It has lately been discovered that plaster of Paris, when heated to 500° C., acquires true hydraulic propertiee, and, when mixed with a due quantity of water, will, at the expiration of ahout three daye, eet into a white, semi-transparent mass of great heauty.

British and American Artisans.

Time was when all the new discoveries in practical science, aod improvements in mahioery aod engioeering, were first made io Eogland; whereas, now it is from Americe thnt ell the new inventions come. There are four or five times as many patente taken out aonually io the United States as in England. It is claimed that one caose of this great discrepsooy is the great expense involved in securing a patent right in England. Too much stress shonld not be laid on this circumstance, from the feet that the oost of a pntent is much less freqoeotly borne hy the inventor than by the capitalists who promote the productioo of the ioveotion. What is it quickens the fncnlties of the American mechanic to such innumereble inventions, that does not opernte in the case of the Eoglish artisan? The fundnmentel question is, Why is capitel eo slow in Englnnd end so prompt io Americe to encourege mechnnicel ingennity? Because, compnred with our own, Eogland is an old coootry, clingiog to routine aod enstom, which constitute, to its thinkiog, the accnmulated wisdom of pset geoerntions; a couotry where nothiog new can be made popular without an agitation and a clamor out of all proportion to the object to be gained. Formerly, wheo British oepitnl inveeted in industry had to depeod almost exclusively on native ioventors, it wae williog to risk more. But now it is safer and cheaper to wnit aod see a patent tested in America, before undertaking the expensive and toilsome task of recommending innovntioos to the British public.—*Indianapolis Mechanical Journal.*

EDISON'S OPERATIONS.—"How can anybody talk about hearing a great desl of the Edisoo system," continued Mr. Edisoo, "and it oever being ready for the public. We have 16,000 isolated lights in operation in this country—lights not managed hy our own engineers, hut by those of our customers. And the nnmber of lights is beiog constantly increased. The best evidence of the light amounting to something (and here a genial, self-satisfied smile illuminated Mr. Edison's face, as if his own electrio light had been turned upon it) is that our compeny is makiog money. We are continually filling foreign orders. We are now engaged in filling an immense foreign order amounting to nearly $600,000. The lights are intended for Italy, Russia, Holland and Eogland. At the old Etna Iron Works, formerly owned by John Roach, we manufacture our dynamo machines. We are now making six large general distributing steam dynamos, each of 1,400 16 candlelight power. Two of these are for Milan. They nre intended to light the great La Scala theater there. We have our chandeliers manufactured by Bergmann & Co. They have recently bought the property in Avenue B formerly owned by the United States Electric Lighting Company. The property originally cost the latter company $175,000; it has been sold for, I believe, about $75,000. Then, in Eest Newark we have works covering about seven acres, where we menufacture our lamps, besides the old Etoa Iron Works and the new works we propose to pnt up in Williamsburg."—*From an Interview in N. Y. Tribune of August 5th.*

TREATING COTTON WITH TANNIN.—The Paris *Cosmos* states that cotton fabrics have been treated with a solution of tannin in the same manner as hides are in the manufacture of leather, and that the cotton thereby acquires greater strength, and better resists moisture and disintegrating effects. The *Cosmos* does not undertake to explain the chemical reactioo which produces this importaut change. We suepeot the change cannot he great, since it has escaped the observation of practical taoners. Those who are accustomed to wearing cotton clothes often eaturated with tan liquor, ae well as similar olothing untouched by tanning, would not be long in detecting and making known a new virtue in their favorite solution.

POTASH SALTS AND ALUM FROM FELDSPAR.—A recent proeedure for manufacturing salte of potash and alum from feldspar consists in treating the pulverized mineral with sulphnric acid and fluorspar. The hydrofluoric acid liberated by the action of the sulphnric acid on the flonrspar, decomposes the silicate, and the potassa and alumina eet free combine with the excess of sulphuric aoid to form sulphates. It is only necessary, when the action is complete, to add a certain quantity of water, and then to decant off the supernatent liquid, when the alum will crystallize out. Large quantities of alum are at present manufactured in this manner.

A NEW INVENTION, hetter, prettier and more artistic than potichominie or decalcomenie, and equally available for practice by any lady with a smattering of art telent, hae been brought under notice. By it poroelain slahs or vases, etc., can he eo prepared as to take the impression of an ordinary crayon, and after having been haked, to retain what may have been eketched on them forever. These peintings are unalterable for time or use, and are consequently well adapted to external and internal decoration, ae well as to honie decoration of articles for the table or for ornament.

CHLOROFORM was discovered about 35 yeare ago, and almost at the same time in Europe and America, hy distilling a mixture of alcohol and chloride of lime, and subsequently rectifying the product.

Mining Share Market.

The Mining Share market has been quite lively for a week or more past. There has been no new strikes to cause this, so far as is known, but there are "expectations" enough to make a good market.

The following mining companies had cash on hand September 1st: Argents, $5 993 93; Alpha Con., $8,988.33; Benton, $8 356 55; Alta, $17,633 64; Andes, $8 673.85; Belle Isle, $6 365.02; Bodie Con., $90.049.07; Bulwer Con., $38,493 11; Best & Belcher, $20 714 06; Chollar, $22,536.46; Crown Point, $22,342.58; Con. Virginia, $15,545.56; Gould & Curry, $9 467.95; Grand Prize, $8,125.20; Hale & Norcross, $1,-04,g.66; Lady Washington, $1,542 87; North Belle Isle, $6,355.75; Northern Belle, $78,578.89; Occidental, $7,228 77; Ophir, $76,901.55; Oro, $7.720 85; Potosi, $14,234.20; Standard, $50,779 99; Sierra Nevada, $3,452.97; Union Con., $57,684.15. The Union Con. balance includes $57,085.27 in unsold hullion.

The following companies were in debt Sep. 1st: Alhion, $49,014.85; California, $26,676.29; Day, $128 043.59; Mexican, $31,447.87; Mono, $631.90; Star, $17,570:22; Star (old indebtedness), $36,839 84; Savage, $11,975.55; Scorpion, $3,803.89.

News in Brief.

THREE hundrad deaths from oholera occurred Monday at Manila, Poillipine islands.

THE death of Johann Holhig, the celebrated Germsn sculptor, is announced from Paris.

THERE are 300 mules steadily employed in packing freight from Crescent City to Happy Camp.

SECSUOENI, the well-known Caffre chief, has been murdsred by another native chief in south Africa.

THE race between the Hillsdale crew and the Thames Rowing Clnh crew has been fixed for Septsmber 15th.

TWO Legislatnres have been organized in Zacatecas, Mexico, and one fight has occurred between the rival factions.

THERE has been a very severe onthreak of foot and month disease in Sonth Derhyshire and Esst Staffordshire, England.

THE Siberian plague has appeared again to an alarming extent in the most widely sepsrated quarters of Enrope and Rnssia.

IN two days 572 deaths occnrred from cholsra at Yokohama, Japan, and at Tokio abont 80 cases and 50 deaths occur daily.

THE grosssarnings of the Western Union Telegraph company during the past 12 months are stated to have been $17,000,000.

DURING Augnst, 1,274 miles of new railroad track was laid in the United States, exclnsive of side tracks on 70 different lines.

THE leading citizens of Aberdeen, Scotland, have agreed to invite the British Association to hold its meeting for 1884 in that city.

A HAILSTORM at Pesth, Hungary, recently, destroyed vineyards and maize fields, partly demolished 50 houses, and killed many workmen.

A TIE drive is soon to be started down the upper Yakima. Some 90,000 ties, it is said, yet remain hanksd npon the headwaters of the river.

Recent Contributions to the California State Mining Bureau.

[Furnished for publication in the MINING AND SCIENTIFIC PRESS by HENRY G. HANKS, State Mineralogist.]

[CATALOGUE.]

4195 Gold in Bismuthite—Queensland. Queensland museum, Brisbane.

4195. Gold in Black Tourmaline—Queensland. Queensland museum, Brisbane.

4196. Chromic Iron—Near Mountain house, near Downieville, Sierra county, Cal. E. W. Cook.

4197. Auriferous Sands—Pioneer mining company, Upper Gold Bluff, Humboldt county, Cal. Dr. J. W. Hood.

4198. Gold Washed from Sands—(See No. 4197.) Upper Gold Bluff, Humboldt county, Cal. Dr. J. W. Hood.

4199. Platin Iridium—Washed from beach sands (See No. 4197.) Upper Gold Bluff, Humboldt county, Cal. Dr. J. W. Hood.

4200. Fossil Horse Bones (Post Tertiary)—Two bones of carpus. Found between the Columbia and Snake rivers, 70 miles north of Walla Walla. Geo. M Sternberg, Surgeon U. S. Army.

4201. Fossil Horse Bones (Post Tertiary)—Astragalus. Found between the Columbia and Snake rivers, 70 miles north of Walla Walla. Geo. M. Sternberg, M. D.

4202. Fossil Horse Bones (Post Tertiary)—Middle phalangeal bone. Found between the Columbia and Snake rivers, 70 miles north or Walla Walla. Geo. M. Sternberg, M. D.

4203. Fossil Horse Bones (Post Tertiary)—First and Middle phalangeal bones of a smaller individual or species. Found between the Columbia and Snake rivers, 70 miles north of Walla Walla. Geo. M. Sternberg, M. D.

4204. Fossil Horse Bones (Post Tertiary)—Head of Metacarpal bone. Found between the Columbia and Snake rivers, 70 miles north of Walla Walla. Geo. M. Sternberg, M. D.

4205. Fossil Horse Bones (Post Tertiary)—Tooth. Found between the Columbia and Snake rivers, 70 miles north of Walla Walla. Geo. M. Sternberg, M. D.

4206. Fossil Horse Bones (Post Tertiary)—Tooth. Found between the Columbia and Snake rivers, 70 miles north of Walla Walla. Geo. M. Sternberg, M. D.

4207. Fossil Horse Bones (Post Tertiary)—Tooth. Found between the Columbia and Snake rivers, 70 miles north of Walla Walla. Geo. M. Sternberg, M. D.

4208. Terra Cotta Vase—Reproduction of an antique Roman nuptual vase. Original owned by the Misses Bruce, of New York, and on exhibition in the Metropolitan museum, Central park, New York. The original was made to commemorate a princely marriage, and after the death of the bride and groom was placed on their tomb, where it remained for more than 22 centuries. It is much admired for the unique combination of the vases, and as showing the perfection the ceramic art had attained at that early period. Restoration made of California clay, and presented by Gladding, McBean & Co.

4209. Chalcedony—Near Aurora, Esmeralda county. Cal F. E. Smith.

4210. Crude Argols—Taken from the interior of California wine casks. (See No. 4145.)

4211. Fine-grained Galena—Hidalgo mine, Inyo county, Cal.

4212. Rock Specimen (Undetermined)—Eureka, Humboldt county, Cal. Geo. O. Sarvis.

4213. Actinolite—Eureka, Humboldt county, California. Geo. C. Sarvis.

4214. Lava with Zeolite—Eureka, Humboldt county, Cal. Geo. C. Sarvis.

4215. Sandstone—Snitable for building stone. Eureka, Humboldt county, California. Geo. C. Sarvis.

4216. Pyritic Ore (Auriferous)—Star of the West mine, West Point, Calaveras county, Cal. Hon. D. M. Burns.

"MOTHER," said little Ned, one morning after having fallen ont of hed, "I think I know why I fell ont of hed last night. It was hecanse I slept too near where I got in." Mnsing a little while, as if in doubt whether he had given the right explanation, he added: "No, that wasn't the reason; it was because I slept too near where I fell ont."

IN the criminal trials in France the summing up was abolished a short time ago, and inasmnch as no reply to the last argnments made for the defense is allowed to the prosecntion, the fnll effect of the prisoner's defense is left on the minds of the jnry, and the prisoner has the bsnefit of the last impression.

BLONDIN, the hero of Niagsra, in spite of his 58 years, has again made his appearancs on the tight rope in the "Neue Welt," at Berlin, greatly to the delight of the Bsrliners.

THE Flatheads have agreed with the Govsrnment Commission to give a right of way through their reservation in western Montana to the Northern Pacific road for $16,000.

MINING SUMMARY.

The following is mostly condensed from journals published in the interior, in proximity to the mines mentioned.

CALIFORNIA.

AMADOR.

FROM VOLCANO.—Amador *Ledger*, Sept. 3: No mining of importance is going on. A force of 20 men are at work on the new shaft of the Downs mine, which is down over 200 ft; 500 ft is the depth to which it is to be sunk..... A small force is also at work at the Tunnel company under the new superintendent, Mr. McDonald. The great flume is being supplied with a new set of blocks. The contract calls for 25,000 ft, which is being filled by James Deane and Mr. Chaquette..... The Golden Gate mine offers for sale all its machinery, which is equivalent to its abandonment..... P. N. Peck is making arrangements to work his great pile of tailings the coming winter, and is sanguine of a golden harvest.

ALPINE.

COLORADO NO. 2.—*Argus*, Sept. 3: The Colorado No. 2 G. & S. M. Co.'s property having passed into the hands of the judgment creditors, J. Larson, W. P. Merrill and P. Curtz, by deed from the sheriff of Alpine county, a meeting was held by the creditors at the court house on last Saturday for the purpose of placing the mine and mill in working order and raising sufficient funds to commence crushing ore and working the mine. This property is well known as a valuable bullion-producing property, and only needs the proper handling to make regular shipments of bullion. We are pleased to know that an effort is being made to reopen this mine, and trust that ere long it will be making its regular shipment of bullion.

CALAVERAS.

JONES.—*Mountain Echo*, Sept. 2: Recent reports from the Jones mine are highly encouraging. Assays were made from average ore from the mine, which yielded as high as $500 per ton in silver, and none less than $200. Henry Lightner, who is one of the most celebrated mining experts on this coast, after giving the mine a careful examination, says, most emphatically, that in all his travels in mining regions he has seen few more promising silver mines.

THE EAGLE MILL.—This is the name given to the new quartz mill that is now in operation on Keys & Lesper's mine. Thus far it is fully up to our expectations, and we shall keep our readers advised of its workings in each issue. The mill we have under consideration is moderate in cost, and places the owners of small leads in a position to realize their products without giving the better portion to induce capital to take hold. These and many other reasons which we could name, entitle the little mill to the careful investigation of the miner.

INYO.

MONTEZUMA.—Inyo *Independent* Sept. 2: Mr. A. H. Griswold arrived last Wednesday from San Francisco. It will be remembered that last fall he made a conditional purchase of the big lead mine, the Montezuma, better known as Billy Make's, which is situated in the Inyos opposite Fish springs. Mr. Griswold then spent considerable money in developing it, but his backers finally failed to purchase it. He has now completed arrangements to get it, and will at once put up smelting works. He has purchased a complete furnace at Darwin, and intends to push matters fast as possible. As giving an idea of the importance of this enterprise, we may state that he will start in on 3,000 tons of silver-lead ore, on the dumps and in sight at the mine. He expects to be prepared to purchase silver ores to increase the rate of his bullion, which fact will be good news to many mine owners all over the upper port on of the county.

BEVERIDGE.—Supt. McEvoy, of Taylor, McEvoy & Co.'s mill, at Beveridge district, came over the Inyo ridge a day or so ago. He says that the mill had just completed some small lots of chloride ore from the Boraga mine. Seven tons yielded 30 ounces of gold, and some 4 or 5 tons turned out about $40 gold per ton. Antonio Morene has put a force of men at work on the Consejo mine, getting out ore for the mill. The mill company has developed quite a good body of ore in the Gold Hill mine. They will start the mill next week for about a month's run on Keynot ore, after which they expect to work their own ore and that from the other claims mentioned. W. L. Hunter and Manly Conkrite have commenced getting out ore for a run at the Hunter steam arastras.

PANAMINT.—Supt. Pheby, of the Inyo Con. company, is working a large force of men in the Wyoming and Hemlock mines, extracting ore. The ore is of much higher grade than any heretofore taken out, and it is expected that the next run will be much larger than the last. Two hundred tons of ore have been delivered at the mill, and this amount will be increased to 600 tons within the next few days. Some new machinery for the big mill is now en route from San Francisco, which will be in place and the mill ready to start up on or about next Tuesday.

NEW PROJECTS.—There is a statement afloat that the machinery for a new smelter has been ordered for Keeler City—probably by the Swansea company. The old Swansea slag pile is an attraction, and may work out some good in the way of getting a new furnace started there. It would prove a boon to the miners of Cerro Gordo, as what they need now is a place whereat to get their ores honestly worked or bought.

LOOKOUT.—Frank Fitzgerald returned from San Francisco to Lookout on Friday of last week. He has a new lease from the company of the Modock mines and the furnace, and is now putting on miners, coal and wood men as fast as he can get them. Under his new and more favorable arrangement with the Modock company, "Little Fitz" will greatly improve on his former successful handling of the property.

REX MONTIS.—Supt. Holt is now keeping the Rex Montis mill going steadily on tailings, intending to keep up operations indefinitely, or until the work is completely cleaned up.

MEN WANTED.—A Darwin letter says: "Men are very scarce around here, and I think about 30 could get work between Panamint, Lookout and this place."

MARIPOSA.

THE HITE MINE.—Mariposa *Gazette*, Sept. 2: Supt. Bothwell, of the Hite Gold Quartz company, has received orders from his company to close down the mine until the lawsuits now pending are settled. In the meantime, the compressor and pumps will be kept running, and everything in trim so as to start up as soon as there is enough

MINING ABOUT WEST POINT.—Calaveras *Chronicle*, Sept. 2: Very good reports come to us concerning the mining interest in West Point district. There is a great deal of activity at present exhibited in that section, and from all the information we can gather the outlook is decidedly favorable. A new era of prosperity is looming up in this part of the county, and the day will soon be at hand when West Point will rank among the leading mining towns of the Pacific coast. Capitalists are now beginning to take hold of the first-class mines of the district. Heretofore speculators have been in the habit of investing capital on worthless properties, some that could be obtained for a mere nothing, and sometimes for the trouble of locating them only. But at present it is different. Experience has taught lessons of wisdom which are now being needed. The well-known Champion mine is being operated by a powerful company, and work is being earnestly prosecuted in it..... The famous Carlton mine, owned by F. M. Ochoa & Co., has been sold to Governor Perkins and Secretary Burns for the sum of $15,000. The progress in the development of the mine will be watched with interest by old residents here. In early days it produced dividends of $500 per day for quite a period of time. Owing to the vast amount of water to contend with in working it, beside partnership complications which followed, the mine was abandoned..... Among the other leading mines of the district that await development are the Lone Star, Riverside, Valentine Hill, North Carlton and Soap Root.

water to run the machinery, if by that time, which is highly probable, the litkation is over. Since the history of the celebrated Hite mine commenced, this is the first stoppage, of any moment, that has occurred to the mine, and one which is hoped will be but temporary. The property, which is now in the hands of a company who own and control a vast number of mines throughout the United States, Canada and Mexico, le subject to the moneyed depression which prevails at this time in the Eastern market, and which necessarily effects more or less the mining interest of this State. This mine, which has of necessity during the past year been undergoing a vast change in repairs and improvements of a permanent character, with a view to a successful future, has not yielded or been prepared to produce rich returns as formerly. Now all that is necessary to successfully extract and crush is in readiness. It is unfortunate there should be any interruption to impede the workings of the mine, for there are many who are in need and dependent, to a considerable extent, upon its resources for a livelihood. Notwithstanding the various opinions in regard to the permanence of this mine, it is already established that the undeveloped portion of the mine lying below the old works is extensive and as rich as any that has been taken from above. A little time, and we are assured all will be well with this mine yet.

MINING ON SWEET WATER.—In years past quartz mining on Sweet Water, of this county, was of some importance, but, like many other localities, was worked at an early period with limited capital and inexperienced miners, before the art of saving gold was reduced to an approximate perfection, as it is at present. The old Nat Harbert mine, which was worked successfully for a while and afterwards abandoned, has been taken up and is meeting with success by Peter Gordon. Billy Simpson and others have gone down on the old shaft and taken out some 65 or 70 tons of ore that averages from $25 to $30 per ton, ground in an arastra, which they are now using. The vein at the bottom of this shaft, which is 70 ft deep, is 2 ft thick and easily taken out, requiring no blasting. Timbering the work is the greatest expense, but as the mine is situated in a dense forest of timber, it is barely a consideration compared with the usual expense of blasting. If the present owners could procure material aid, this mine, most undoubtedly, would develop into one of the best mines of the county.....Quite recently some Frenchmen struck rich rock close by Gordon & Co.'s works, on a continuation of the old Tom Early vein, which so elated them that they spent a day or two in rejoicing over their rich find. Mr. Gordon, our informant, who saw the rock, says it was exceedingly rich in gold.

RICH STRIKE.—Mariposa *Herald*, Sept. 3: Messrs. John Allen and John Kieffer have sunk a shaft on their mine a depth of about 40 ft, which shows very rich ore in gold and silver. They have about 30 tons of ore on the dump, which is estimated to be worth from $200 to $300 per ton. The vein has a uniform thickness of about 18 inches, and increases in thickness as they go down, with a good gouge and well-defined walls. Messrs. Allen & Kieffer are old experienced miners and prospectors, and now think that they have found a bonanza. The mine is situated about one-half mile westerly from the house of J. P. Thompson, and one-quarter mile south of the Mariposa and Yosemite wagon-road, on a tributary (Italian gulch) in Chowchilla valley.

MONO.

BAY QUEEN.—Homer *Index*, Sept. 2: About 20 men are now employed in this mine. The tunnel is now in 100 ft, and is being rapidly pushed ahead. The ground through which the tunnel passes is very hard. The winze from the main drift to meet the tunnel has been sunk 45 ft, leaving but 15 ft between the bottom of the winze and the tunnel. The ore in the various workings is improving.

THE GORILLA.—About 12 men are now employed in this mine, but as soon as work on the contract for an upraise from the lower tunnel to connect with the winze being sunk from the middle tunnel is commenced, the number of men will be increased. The ledge is showing well.

THE MAY LUNDY.—Everything about the mine is working smoothly, and the ore continues to improve. The mill is kept running at full speed, and is crushing about 25 tons per day.

NEVADA.

THE EMPIRE.—Grass Valley *Union*, Sept. 2: This mine, about the oldest one in the district, is looking better then ever before. On Saturday a fine pay chute of rock was struck, and the ledge is of good size. A carload of fine specimens was sent to the surface, which are literally full of gold. There are many other old, abandoned mines in this district which would, no doubt, pay handsomely if they were operated. The Ophir has been on the verge of abandonment many times, but now is one of the best mines in the county.

THE IMPERIAL.—Work of crosscutting for the ledge in the Imperial mine, near Deer creek, some 2½ miles from town, has been going on for some time. On Saturday the miners cut through the ledge, which is about 4 ft wide, of very fine-looking quartz, showing heavy sulphurets and some free gold. The rock has every appearance of being good, and will soon be tested by mill process. Imperial stock has advanced considerably in the market.

BIRDSEYE CREEK CO.—This company, operating at You Bet, in this county, having completed its final clean-up for the season, has discharged all its employes, and J. S. Goodwin, superintendent, has sent in his resignation, which has been accepted by the company. Mr. Goodwin has managed the affairs of the company with great skill and ability. Like Mr. McMurray, he has been on hand when the interests confided to his hands required his presence, and when those in the interest of sickens have sought him, his proverbial modesty has been conspicuously apparent. Report says he will purchase land and settle in Washington Territory. We regret to lose so valuable a men.

MINING TRANSACTION.—*Tidings*, Sept. 3: The Robinson Bros., managers of John Robinson's circus, and John Lowlow, the jester of that organization, have entered into negotiations with Mr. George Murphy, of this place, for the purchase of the several quartz ledges situated on the north of our town, and near Mr. Murphy's residence. When the company was here their circus tent was pitched near these ledges, and the gentlemen spoken of above took some pieces of quartz from them and had it assayed, the assay proving to be satisfactory. A contract will soon be let for sinking a shaft on the ledges, and as soon as the circus gets into winter quarters, Messrs. Robinson and Lowlow will come to Grass Valley to make arrangements for further developing the property. The ledges are considered, by judges of quartz, to be well worth prospecting.

IMPERIAL CON.—The Imperial Con. mine cut their ledge last week at the depth of 107 ft, and are now starting east and west drifts. The Imperial had a crushing taken from it some months ago, the shaft then being down 80 ft, which paid something over $16 to the load. The ledge was then 5 ft thick. All the prospects from the Imperial have been, and are still, very flattering. The ledge at the present depth is 4 ft wide, with perfect walls.

PLUMAS.

WILL RESUME OPERATIONS.—Plumas *National*, Sept. 3: A telegram from Mr. Patterson, of Chicago, received on Wednesday by Mr. Parsons, informs him that Mr. Allstrom will be in Quincy by the 15th inst., prepared to pay all demands against the Monte Christo mine, and resume operations in the tunnel. This is good news, and we are glad that the work will go on, for it is almost certain that the mine will be among the big ones of the coast when the right place is reached.

ANOTHER GOOD LEDGE.—Messrs. Carripy & Teho came over from their mine, east of Genesee valley, on Sunday, bringing some splendid specimens. The mine le one discovered by Mr. Carripy, and but little work has been done on it as yet, but a shaft now down some 25 ft shows a clean vein, well walled up and about 6 ft wide, and many of the pieces of rock are filled with free gold. The vein also carries silver, and assaye made give very promising results. This mine certainly should be developed, as it gives flattering indications of becoming a "bonanza" for the owners.

ANOTHER MINE SALE.—We are told that Messrs. Swan & Ament, of Granite Basin, have sold one-half of their mine, adjoining the Franklin, to parties in the lower country, for $4,000, and that the owners will put up a large mill as soon as possible. We hope the report will prove true, for the ledge has been thoroughly prospected and is known to be a good one, and if the new owners bring enough capital to bear to put on the requisite machinery, they will at once open up another good-paying mine. Granite Basin seems to work slowly, but it will head the list as a quartz mining district one of these days.

FOUR HILLS MINE.—From a gentleman who has been up in the Eureka country we learn that the Four Hills mine, which is located near the county line and between Eureka Mills and Sierra Buttes, has recently developed some wonderfully rich rock, and numerous large "chispas" have been taken out. The company owning this mine has been putting up a fine quartz mill, and we are told that the coarse gold saved in the past few weeks will more than pay for all the new improvements, and starts operations there under very favorable auspices. If some of our friends up that way would give us a full description of the new mine and mill, it would prove interesting to our readers, and we would gladly give it space.

TUOLUMNE.

TUNNEL.—Tuolumne *Independent*, Sept. 3: The Riverside mining company has been 4 years engaged in putting in the lower main tunnel to reach the ledge. Owing to the rapid pitch to the east of the vein, the miners had much further to run than was at first anticipated. Mr. Williams having made arrangements with a San Francisco company to go on with the work, with a view to purchase, is sinking a new shaft in the middle drift, putting in air-compressing pumps and new hoisting works. In the meantime the main tunnel is being pushed ahead, and when the vein is reached at this level, there will be, at this point, 450 ft of stoping ground.

STOLEN RUBBERS.—A party of Italians are mining in the lower Peanuts reservoir, and the "wash-ups" of late have been amazingly small. One of the partners took a shot-gun and patrolled the works. Indian Frank was in the sluices with a scraper, as busy as a gopher. The Italian said: "What are you doing there?" and the Indian replied that he was "getting a little gold." He ordered the thief to advance, which he did to within about 30 ft, when he escaped into the willows—the Italian and the Indian exchanging shots with each other. It was found that he had sold some gold amounting to about $5 at Mundorff's. He was arrested Thursday.

NEVADA.

WASHOE DISTRICT.

UTAH.—*Enterprise*, Sept. 3: Timbering and repairing the incline at the 1550 level.

CON. VIRGINIA.—On the 2500 level southeast drift No. 2 has been advanced 22 ft. On the 2700 level the joint California southeast drift has been extended 30 ft.

CALIFORNIA.—Extrecting ore from the old croppings. On the 2700 level the joint Con. Virginia southeast drift has been extended 30 ft.

MEXICAN.—On the 2700 level south drift No. 2 has been extended 36 ft. The joint Union west crosscut has been extended 12 ft. On the 2900 level the joint Ophir winze has been sunk 3 ft, and the southwest drift extended 13 ft.

OPHIR.—On the 2900 level the west crosscut has been extended 25 ft. The joint Mexican winze has been sunk 3 ft.

UNION CON.—On the 2600 level the east drift has been extended 29 ft. On the 2700 level the joint Mexican west crosscut has been extended 12 ft. On the 2900 level the joint Sierra Nevada west crosscut has been extended 24 ft. The south drift has been extended 15 ft.

EUREKA DISTRICT.

STRIKE IN ORIENTAL & BELMONT.—Eureka *Sentinel*, Sept. 3: Huot & Bennett have been working on the Oriental & Belmont mine, on Adams hill, under lease from W. P. Haskell, during the last two months. From the grass roots down excellent ore has been taken out, carrying a high per cent. of lead. They are now down about 20 ft, where they have lately struck an irregular deposit of heavy galena, which assays from $50 to $100 in silver, with a small per cent. of gold. A piece of the ore, weighing a pound, was melted in a blacksmith's fire and produced six ounces of metal.

LEWIS DISTRICT.

MORNING STAR.—Lewis *Herald*, Aug. 30: A contract has been let to W. Maffly and Matt Coyne to sink 50 ft on the Mayo incline. As soon as this is done a drift will be run on the ledge and up the ore body as soon as possible. The north drift is in 45 ft, in good ore the entire distance. The road to St. John's flat has been completed, and all the force is thrown on the grade from the flat to the mine, which is 3,000 ft distance, and will be much easier grade then the road just completed.

BETTY O'NEAL.—South drift in bottom level has been advanced 13 ft. North drift on same level has advanced 14 ft. The drift is carrying a good, strong ledge, showing several streaks of very high-grade ore. Crosscut running west is all in black ground, which is quite soft, with a strong flow of water coming from the face. Since the connection with the Pierce winze, stopes have been started upon the ore vein, which are producing ore quite fast. A winze has been started from the big stope on one of the richest ore streaks that have been discovered in the mines; this streak is from 16 to 18 inches wide, giving assays from $150 to $2,750 per ton, and all this ore will mill over $200 per ton.

THE Highlaud Chief mill is now running night and day, and, from the present outlook, they will probably make a long run. They have shipped the past week 7 bars bullion, valued at over $7,000.

COLUMBUS DISTRICT.

NORTHERN BELLE.—*True Fissure*, Sept. 2: The formation on the 5th shaft level shows no material change. The main drift has been advanced 9 ft during the week. Thirteen feet have been made in crosscut No. 1, it being now in decomposed quartz carrying heavy iron sulphurets and giving low assays. Owing to the hard ground, and the fact that 2 days of the week have been consumed putting in air-boxes, the crosscut, from the main drift on the 3d shaft level, has been extended but 7 ft; its total length is 30 ft. On the 8th and 9th levels the stopes are holding their width remarkably well and turning out the usual quantity and quality of ore. The ore body below the 9th level looks fully as well as it did last week. As far as developed this body of ore has been found on the 8th, 9th and 10th levels, and as soon as possible a crosscut will be started in the direction of it from the 11th level to prospect for it at that depth. There are being extracted and sent to the mill about 64 tons of ore daily. The bullion shipments were $19,333.07 for the week ending August 31st, and the total shipments on August account have been $86,878.27, with another shipment of about $8,000 to be included.

MOUNT DIABLO.—The east drift from the bottom of winze No. 1 is to 23 ft, and the face shows ledge matter with a small amount of ore. The south crosscut from this winze is in 46 ft, and the formation is softer. The raise on the 2d level, nearly north of the shaft, shows about 2 ft ore, which assays $110 per ton. The raise from the west drift, on the same level, has connected with the west drift from the Callison winze, and is showing 6 inches of $80-ore at the point where the connection was made. The south crosscut from the Mount Diablo adit has advanced 18 ft during the week.

LUCKY HILL.—The work on this property is still progressing very favorably. In a north crosscut, on the 3d level, a streak of chloride ore has been cut that is from 6 to 10 inches wide, and gives assays from $150 to $200 per ton. Ore is being extracted on the 2d level, and the mine throughout looks well. Some good reports may be expected from the workings of this company.

SCORPION.—This mine has been leased by its owner to T. J. Harrington, who has been working it for some time past with very favorable results. He has shipped 2 carloads of ore, and is now engaged in taking out more, with a prospect of keeping up a bullion-producing proposition for some time to come.

SARATOGA.—A donkey engine has arrived for this mine, and is now on the ground. It will be placed in position at once, when operations will be resumed, with an opportunity of developing the property more rapidly.

SILVERADO DISTRICT.

SILVER NUGGET.—Eureka *Sentinel*, Sept. 3: John Potter was in town yesterday from this promising mining district. From him we learn that the materials are being shipped out for track and cars for an 800-ft tunnel in the Silver Hill, one of the mines of the Silver Nugget series. This mine was leased by him to tributers, by whom developments have been made to justify him in putting up for the materials to be used. The Connolly mine Mr. Potter reports looking well. In the Diagonal, he tells us, prospecting drifts are being run, with favorable indications.

WASHINGTON DISTRICT.

MAKING MONEY.—Esmeralda *Herald*, Sept. 2: Oliver Peartree and two other men are working some mines in Washington district, about 18 miles southwest of Aurora, and are making money. With a little 3 stamp mill and Dodge concentrator they have ground up and concentrated two tons of bullion in the past three weeks, that assays between $800 and $900 per ton.

ARIZONA.

THE NEW STRIKE.—*Alta-Arizona*, Sept. 2: We gave a brief account a short time ago of an important strike at the Little Cottonwoods, about six miles from Hackberry. We paid a visit last week to this new camp, and from personal observation, we can truthfully say that the camp has a most promising outlook. Our visit was necessarily very brief, and we only saw one mine of the many that had lately been discovered, but that mine alone bids fair to develop into a property large enough to create quite a boom. It was discovered by one J. B. Gregory, but was not thought to amount to much until within the last few weeks. A. H. Hanson, an old prospector and a gentleman of a clear head, happened to hear of it, and thoroughly inspecting the ledge, he came upon a body of ore projecting slightly above the surface, which on careful examination proved to be very rich. Keeping his discovery a profound secret, he immediately entered into negotiations with Gregory and the three other parties owning the claim for its purchase. He succeeded in purchasing Gregory's and two of the other co-owners' interests, the fourth partner, James Fulton, refusing to sell. The average width of the ledge is about 4 ft, and its trend is northwest and southeast and dips to the north. The richest pay streak disclosed is about 18 inches thick, though the whole ledge carries silver in paying quantities. About 4 tons of ore had been taken out when we were there, and the shaft, or, rather, hole, from whence it was taken, was hardly 3 ft deep and not that many feet square. This ore, Mr. Hanson informed us, would, at least, average $60 per ton, and portions of it would assay into the thousands. The ore will smelt easily, being galena and carbonate of silver. Mr. Hanson owns two extensions on the ledge, and a second extension is owned by Messrs Grant & Garnes. The mine is called the "Chloride." Messrs. Brooke & Chaffin have located a mine of good promise near the Chloride. About two miles east of his mine there is another camp where some very good prospects have been found within the last three weeks, the most important of which we note are owned by Remington, and Carr, and Crumpy, and Adams. A new town has been laid off near the Chloride mine, which will be called "Cottonwood."

THE OMEGA COPPER MINE.—Arizona *Citizen*: The Omega mine, upon which 20 men are employed, continues to develop most favorably. The main shaft is now down about 80 ft, and in its course has cut through large bodies of ore of a most variable character. Sulphides of copper, or copper pyrites, red and black oxide of copper, metallic copper, and blue and green carbonate of copper have been encountered throughout, and generally high graded in its nature. At the time of Prof. Rickard's visit, a week since, the bottom of the shaft was in ore of a pyritous character. In addition to the shaft, there are about 70 or 80 ft of drifts, all of which have been made in good paying ore, so that large quantities have accumulated on the different dumps. Work will be pushed forward as rapidly as possible, with a view of demonstreting beyond peradventure whether the company has a mine or not. Until that has been decided the reduction works will not be put up. If decided favorably, machinery will then be ordered and erected on a scale proportioned to the capacity of the mine as en ore producer. Present indications are most flattering.

HUACHUCA NOTES.—Tombstone *Republican*: A big strike is reported in the Silver Peak mine, at the head of Hunter's canyon. This is a copper mine, and the ore is said to be a fac simile of the richest from Copper Queen. There is a good deal of native copper in the ledge. In the Yellow Jacket mine, owned by Messrs. Field & Rinehart, they have struck a large body of rich carbonate of lead and silver in their crosscut, in at a distance of 18 ft. The ore is the best ever struck in the Huachucas. Mr. J. O. Jones, who has been working for Mr. Rinehart, has gone into the employ of the Huachuca Water Co., to look after their Carr canyon reservoir, their former employe being the young man who got into trouble in the row at Ramsey's canyon recently, and who now languishes in durance vile in the county jail.

COLORADO.

LIEN.—Georgetown *Courier*, Aug. 31: The Hukill workmen filed a lien on the mine last week for the sum of $3,032 75, the amount of their wages past due. There were 31 men united in the lien.

A RICH strike of native gold and silver is reported in a lode situated near the Mary Jane, on Lenawee mountain, and owned by Mr. Worthington, of Chihuahua.

A STRIKE of from 0 to 8 inches of solid galena of a good grade was made last week at the heading of the lowest level on the Silver Ledge lode in the horseshoe below Gray's peak. As the heading is not yet within 10 ft of the place where good ore was found in the level above, it is thought that the level has commenced to enter an extensive body of ore.

THE CORRY CITY LODE.—Corry City lode, which crosses Cherokee gulch, the dividing line between Republican and Sherman mountains, has been leased at the surface to Mr. Frank R Carpenter for a period of three years, the lessee having the right to work the lode to a depth of 900 ft below Cherokee gulch, which gives him an average depth for the whole length of the claim of about 450 ft. The lode is owned by the Diamond Tunnel Co., and is one of the main fissures of Republican and Sherman mountains, being fully 25 ft between walls, and the whole of the body of crevice rock is more or less mineralized.

THE DUBUQUE LODE.—A short distance above the junction of Fall river and Clear creek, on the former, one of the largest lodes in the county crosses the gulch, and has been patented for a distance of 3,000 ft in length, under the names of the Dubuque and Dubuque Extension lodes. The Dubuque, which lies on the east side of Fall river, has been opened by a shaft 60 ft deep, and at the surface the vein has been stripped a short distance for the decomposed, free milling ore, which pays a nice profit under stomps, the vein of mill dirt being fully 8 ft wide.

RUSSELL DISTRICT.—*Register-Call*, Sept. 3: Charley Harker has started up the Legal Tender mine in Russell district, which has been idle for a year or more, for lack of means with which to prosecute developments. A light force of miners are at work, but as soon as new ground can be opened up, the force will be correspondingly increased.....A letter received from Mr. John B. Mellor, who went East some months ago, conveys the pleasing intelligence that the Hazeltine company, o Philadelphia organization, will resume work again shortly, negotiations to that effect being nearly completed. The mine is too valuable to be allowed to remain idle, and has a fine plant of machinery, concentration mill and buildings over the mine, to work it to a profit.....On Willie, below the Hazeltine, the Silver Dollar mine is being operated under the management of Mr. Harker, for the Silver Dollar M. Co. Work is confined to the opening of new and undeveloped ground, consequently the output of ore from the vein is comparatively light at present. It can be increased when the new improvements underground are fully completed. ....Paul, Truscott & Co., lessees of the Powers mine, the first vein north of the Silver Dollar that is in any manner developed, have the working shaft relieved of water and debris, and are sinking. They have a fair-sized body of sulphide ore in the bottom workings, which carries not only silver, but a high percentage of copper. The Powers is the only mine in Gilpin county at present opened up that yields sulphide of a rich character.....The Rara Avis M. Co. have the water out of the Whitney or No. 1 shaft, on the Whitney vein. Mr. H. H. Boucher, the superintendent, is driving the 350 east level 50 ft below the adit level. The miners have driven through ores of a high grade all the way from the shaft to the present level heading. In the 300, or adit level, ore carrying native silver is of common occurrence. This is trammed in cars to the coibing house, adjoining the concentration mill. All who have visited the Whitney within the past two weeks concede that the ore body in the 350 east level is the same as that found in the chute above. Ore from this mine is to be shipped to Denver to supply, in part, the Thompson pulverizer and Embry tables being erected in the National mining exposition building, by Mr. Tasker, of Philadelphia. The company has a large amount of concentration ore on hand that has not been treated.

IDAHO.

STRIKE IN THE ELKHORN.—Ketchum *Keystone* Sept. 3: Last Monday the 300-ft tunnel driving to tap the Elkhorn reached the objective point and exposes a handsome body of solid galena ore, which, from present appearances, is over 3 ft in width. The vein here is very firmly "in place," and is disclosed at a point 65 ft deeper than any developments heretofore put on it. Work on an incline, which is already down on the ledge 60 ft, will be continued, and this tunnel or drift, which is running alongside the newly tapped ore body, will be extended 50 ft, until it is immediately beneath the incline, when a raise will be started on the vein to connect with the operations above. The distance to be traversed by the raise between the drift and bottom of the incline will be about 60 ft, and its completion will secure good ventilation and drainage, and put the mine in excellent shape for easy and profitable stoping.

THE RICHEST FIND IN SAWTOOTH.—Vienna *Reporter*, Sept. 2: News reaches us that Pat Kelly and a young German have found the ledge that has been so long looked for by many of our good prospectors located in Beaver gulch, about 4½ miles south of Sawtooth City, and situated between the Columbia and Beaver and Pilgrim mines, on the opposite side of the creek, near the old Ruby cabin, and about 125 yards from the head of the creek. The above-named parties have been sluicing the ground by water coming from the mountains for the past few months, and had about 1,000 ft sluiced and 6 ft deep, when they run a side cut and found the ledge. The ledge is running southeast and northwest, a different course from which they expected to find it. The ledge is 4 ft wide, carrying black sulphurets, and more or less antimonial and ruby silver, assaying from $1,200 to $5,000 per ton. Two separate cuts have been run into it, and they find it to be a solid and well-defined ledge. There is no small seam about this, as all the ledge is good pay ore from wall to wall. This will undoubtedly raise a great excitement in the Sawtooth district, and a number of other good locations may be discovered in the same way.

PLACERS.—Vienna *Reporter*, Sept. 2: From letters from Booanza, and what other information we gather, the placer mines northwest of here are all they were reported, if not better. A. A. Mayfield & Co. have struck the channel on Loon creek that they have been trying to find for the past 2 years, and, contrary to the prevalent opinion, found rich dirt, and will make a good deal of money. John Faulkner, and several others, of Bonanza, have discovered rich placer and quartz near Loon creek, but we did not learn the exact location. Other placers than those mentioned in our last issue have been discovered on Middle Fork. They are said to be rich, and from the fact that a good many prospectors went to the new gold fields and none returned, we think the reports are not exaggerated. Last year Mr. Tim Cooper, of this town, and another man, found placer on the Middle Fork, but a heavy snowstorm drove them out before they had thoroughly prospected the ground. We are satisfied that the mines of that country are good and extensive.

UTAH.

A REVIEW.—Salt Lake *Tribune*, Sept. 3: The week has been quite devoid of sensations in the mining world, the new strikes developing nothing noteworthy as far as prosecuted. The mining camps in general are doing better than ever before, and the output is steadily increasing. One of the most noteworthy features of the mining industry of late has been the very general disposition to seek for methods of handling the low-grade ores, large bodies of which are found in nearly every camp. We detailed the other day the process of the Yosemite in this regard, and there can be no doubt of the great demand for practical methods of concentration, nor that the best means to secure the concentration of the low-grade ores will speedily come into use. The spirit of adjustment of contentione is pleasantly rife. The Pinyon-Climax difficulties are in process of adjustment, and we see no reason to doubt that the course of settlement will proceed to an amicable conclusion, and the bill be worked before long in good and productive style. The product of Pinyon hill will, when it begins to join the bullion product of the Territory, make an immediate and appreciable increase in the volume of the silvery stream. Another settlement of differences which all will be glad to hear, is, we learn, about to be made between the Bonner and Michener interests at Stockton. Gen. Connor, in the Great Basin, found the ore at a great depth, but it was in Michener's ground; the latter couldn't get at it, lacking machinery and development. Connor had the development and the machinery, and Michener the ore. The Great Basin has been shut down all summer by injunction, and neither interest got any benefit. But now the ore is to be taken out jointly by the use of the Great Basin machinery and workings, a Boston company representing the Michener interest. It is a very happy and appropriate settlement of the troubles. The Salt Lake & Western still talk of putting in spur lines to Silver City, the Mammoth Gulch and Eureka. Otherwise, there is nothing new to report in the Tintic district. The visit there of Supt. Clark this week has given rise to some talk of the further extension of the road. It is understood to be a favorite project of Clark's, and others with him, to extend this line rather than the Oregon short line, and there is some talk of taking the gradere from the latter wheo cold weather comes, and putting them on the extension from Tintic to the mining districts of Nevada. A rich field awaits the road there, and some of its officers are well aware of the fact and want to push on and occupy it.

OREGON.

PROSPECTING.—Jacksonville *Times*, Sept. 2: Prospecting is going on everywhere.....J. M. Cook has found a promising quartz ledge in the Gold hill region.....Patterson & Co. have a "giant" at work in their Beaver creek (Cal.) mines, with excellent prospects.....Wm. Willis, of Ashland, has found a ledge of coal in the mountains, within about 12 miles of that place.....Derickson & Co.'s quartz mill is nearly in position at Horsehead, Josephine county. They have struck good prospects on the ledge.....Jack Layton was in town Monday, from whom we learned that cleaning up is still progressing at his claims on Farris gulch. An excellent result has already been assured.....Desseler & Co., of Scotch gulch, Josephine county, have cleaned up, with better results than ever, having taken out several thousand dollars. Their elevator works like a charm.....Curtis Bros. have contracted for the delivery of 20,000 ft of flume lumber, and will operate on Jackson creek, on an extensive scale, next winter. We learn that they will also invest in a hydraulic..... Wimer & Simmons, of Waldo, Josephine county, finished cleaning up this week,

The Lost Mines of Cana.

Ws were shown this week a piece of wood called, we ars informed, amarillo wood, which was taken, recently, out of ths famons mines of Cana, on ths Isthmus of Darien. It was in a perfect stats of preservation, heing hard and strong as sver, only a few little worm holes, as if mads by needles, showing. The wood is closs grained, and vsry hard and tough. This timber was put in these mines soms time between 1668 and 1727. In making excavations in thess mines lately, many of the 12x12 timbers were found by Mr. J. H. Crossman, ths well-known miner, ths wood we saw being soms of that bronght hack by him.

In connection with this snbject, ws are enahled to givs the observations of Mr. Crossman concerning thess famous mines. It is not always best to invest in mines on account of their historical record; nor is it advisable to accept as historical record the mere vague statemsnts which may he made concerning mines. No douht there are many mines which were rich that may be rich yet; hut it not oftsn very rich mines are abandoned. We have in our day examples where a lode is exceedingly rich, and even when followed on immediately, proves poor again. And because mines were once fabulously rich, or supposed to have been, it is no reason why, if found, they will again continue to be so. Concerning the mines under consideration, it is understood that another attempt is now being made to get Eastern purchasers to invest, notwithstanding the adverse reports of competent men. But we will let Mr. Crossman tell the story in his own manner, which, by the way, is a very good one.

The Lost Mines of Cana.

The Mnnchansen or exaggerated stories of the Spanish historian, relating to the immsnse values that have been extracted from certain now abandoned mines of Mexico, the Spanish main and South America, hava often assisted the unscrupulous adventurer in placing old, worked-ont properties at extravagant figures with credn-lous capitalists. Tbe following history is a fair illustration of the chances the capitalists take in bnying mines on the reputation of "ancient history."

The discovery and conqnest of America hy Spain, the terrible atrocities committed by Pizarro and Cortez on the poor defenseless Indian races, in their thirst for gold, are all matters of history that every school boy is familiar with.

The Isthmus of Darien, known then as the Spanish main, was conquered, colonizsd, or settled by subjects of old Spain; cities and towns were built, costly structures erected, the aborigines snbjugated and enslaved. The conquerors proved hard task masters. The cry was "give, give, give!" The poor slave responded. Shipload after shipload of treasure was sent to the mother country to satisfy Spanish greed.

The king's royalty was one-fifth of all of the treasnre extracted. Spsnish ooffers were loaded down with American gold. The walls of Carthagena were said to have been hnilt from the king's royalty derived from the mines of Cana, to say nothing of the millions that were captured by the English buccaneers.

The extraordinary richness and yield of these mines excited England's cupidity. Privateers were fitted out, and many of proud Spain's richly laden galleons were captured. The bold buccaneers, Morgan and his coadjutors' careers are historical. The city of Panama was repeatedly sacked, and her inhabitants held for ransom. The isthmus, on hoth shores, was at intervals the prey of these pirates, and the cities and towns looted. The rich mines in the interior were worked at their pleasnre; the aborigines of the country heing always ready to join them, to free themselves from the yoke of their hated task masters, the Spaniards.

In 1840, a wealthy stndent in Paris, named Emelie Libreton, while pnrsning his studies in Spanish, became interested in the historical adventnres of the hnccaneers and the wonderful stories of the gold mines on the Isthmus of Panama, particularly of the Cana mines.

History related that an extraordinarily rich mine was discovered in 1668 hy a runaway slave near the headwaters of the Cana river, which empties into the Gulf of San Miguel, then into the Pacific ocean, heing 120 miles south of Panama, and 60 miles in the interior, near the summit of the Sierra Madre or mountain chain that divides the waters of the two oceans. This slave discoverer of this rich mine was freed from bondage by the government and endowed with a fine estate near the City of Panama. Work was commenced. The mine proved immensely rich. A city named Santa Cruz de Cana was founded, and in a few years contained 10,000 inhabitants, who were all snpported from the product of the mine, principally worked hy slave lahor. Gold was so ahundant that it was measured by the quart instead of being weighed in scales. The miners powdered the hair of their sweet-hearts with gold-dust on carnival day, instead of the powder nsually used. The Dons waxed fat and rich. A quart of gold-dnst was a common het on the issue of a cock or bull fight. The slaves were ground down; gold-dnst flowed in. The girls were pretty and wine the common hever-age; soil prolific and vegetation abundant. The plantain, hanana, orange, lime, pine apple, sugar cane, coffee, chooolate, with fruits and vegetables of ths tamperate clims wers cultivated in ahundance. Wild game abounded. Ths "machs monto" (tapisr), often weighing as mnch as 2,000 lbs., furnished a meat resembling heef; wild hogs, dser, rabits, hars and monkeys in abundance. Ths latter is considered a grsat dslicasy. Of the feather tribe, Muscovy ducks, the pheasant, pigeons, turkey, parrot and sevsral othsr varieties of fowl. The stream swarred with fish of delicious flavor; ths india-rnbber tree (oaont chonc) in groves, and all ths varieties of ths finer cahinet woods, mahogany, etc., abonnded. Ths slevation abovs ths ssa level heing 1,800 ft., the climats was healthy, delicious and halmy. No malaria and no local diseases to interrupt or mar ths happiness of the inhabitants of this favored and prosperons locality. Ths principal mins, the

"Espiritu Santo"

Was worked to a dspth of 200 ft. vertical, by thres lsvels called gallsry; on each level was an excavation cut in the solid rock (called receptacles) for holding ths seepage water. Ths sntrance and exit was made by stone steps cut in the solid rock; the ors and water from the mine was bronght np on the backs of ths men in leather sacks. Each miner, at the end of ths week, was entitled to one pan of dirt free, which usually yielded from $40 to $100 of gold values. The mine was worked hy 12-hour shifts, of 100 select men on each shift, with one undergronnd "boss" to each 10 men, to direct the work and prevent stealing; but the utmost vigilance conld not prevent the miners from daily robbing the mine of thousands of dollars of gold values, which were squandered and spent *a la minero*. The mine prospered and was

In Bonanza

Until 1712, when the buccaneers, hearing of the wonderful richness of this mountain town, decided to attack it in force, and with the assistance of the Indian bondsmen who joined them, attacked the city, captured, looted it and drove off the Spaniards; took possession of the mine and worked it successfully for a brief period; then abandoned it, after which the mine was profitably worked until 1727, when it caved in, and the greater portion of the miners were huried in the rnins. All miners are more or lees superstitious. At all events, the "Espiritu Santo" miners were so much so that they never could be induced to reopen the mine. The town soon went to decay, and the king of Spain ordered "the mine closed forever." The buildings and improvements soon

Crumbled to Dust,

And all evidences of a once busy, populous and prosperons city were covered by a dense growth of vegetation, and the "city of Santa Cruz de Cana," with its mines, was a thing of the past, until once more brought to the front by our Parisian student, Mons. Emelie Le Breton. Having abundant means at his command, and a believer in the legend, he visited Spain, and at Madrid obtained the consent of the authorities to reopen the long-sealed Spanisb vaults where the records of these mines were kept. He obtained such information as induced him to visit Panama and expend 50,000 francs in the attempt to discover the site of the long

Lost Mines of Cana.

He exhausted his means and returned to Panama; in 1848 the gold discoveries and excitement in California having attracted considerable attention, he abandoned the enterprise.

At a later date, Dr. O. M. Wozencraft, of Spiritualistic fame, while in New York, received a "communication" that induced him to visit Panama in search of the long-lost and much-looked-for Cana mines. A very readahle and interesting description of his adventure and mishaps will he found in the July, August and September numbers (of 1881) of the *Californian*, under the title of "The Wilds of the Darien," by O. M. Wozencraft.

A careful reading of his adventures will save the writer much trouble in details of the "ronte." The Doctor has been graphic and poetic in bis description. It seems, however, that he did not succeed in finding the long-lost treasure, as he shortly returned to California. A Mr. Newcomh, who seems to have been the spirit of the enterprise, still persevered, formed a new company with Messrs. Conaut, Cook and Rude, of Panama. Mr. Wells, and other capitalists of New York, in 1875, were induced, hy Mr. Rude's representations, to invest. They spent some $75,000 in opening roads, clearing the ground, building a sawmill and purchasing an outfit of Little Giants, hose, pipe and hydaulic machinery to work a qnartz mine. The result was, as may have been expected, a failure.

In 1879, the writer was in New York. The project was revived. Gentlemen of large means were interested; a company was formed and stocked in $25,000,000. The writer was dispatched as an expert to examine, develop and report on the "lost mines of Cana." While *en route* on the steamer he must have heen also inspired by the spirits, as he perpetrated the following atrocious doggerel. There is one redeeming point in his favor, however. He acknowledges that there is more truth than poetry in it, and promises, if he succeeds in finding either treasure or the bones of the defunct, caved-in miuers, he will furnish the sequel set to another tune and in hetter rythm:

The archives of Spain
Were said to contain
Documentary proofs of great treasure.
What whoppers they told
Of the hushels of gold
That were extracted from the mines of famed Cana.

Ancient history reads
Of the terrible deeds
That were done hy the buccaneer crew;
The Dons were not elow,
As all of us know,
In hunting for treasures "*perdu*."

The historian wrote
That the mine of most note
Was christened the "Espiritu Santo."
Tivas abandoned from fear
Of the bold buccaneer,
And had not been disturhed for years "*tanto*."

He also here stated,
And minutely related
The million of treasure extracted.
Miners powdered the hair
Of their particular fair,
And the trihute the king yearly exacted.

Stone steps hy the score
And tons of rich ore
Were left in the depths of famed Cana,
When the mine caved in,
And three score and ten
Were crushed in a horrible manner.

There were galleries three,
And stone ladders you would see,
To hring out both water and ore,
On each "*gallarie*:"
"Receptacles" there would he
For holding the water in store.

Ghostly noises were heard
After the case had occurred,
And the miners departed in terror;
Spain's king, with great pain,
Saw 'twas clearly in vain,
And he ordered the mine closed forever.

This legend, I'm told,
Was a century old
When the ghosts of the defuncts assembled;
The spiritual crew
Thought it never would do;
They shouted until the ground trembled.

Doctor Wozencraft heard
The spiritual word,
And summonsed the "boss" to a seance;
He rapped out the how
Of this spiritual row,
And went off himself in a trance.

He visited the scene
Of his spiritual dream,
And found that the spirits were truthful;
He horned out the rock
And measured each hlock,
And carried off nearly a hatful.

Then summoned a few
Of the faithful and true,
And told of his fahulous find
Of hright glittering gold,
Of the millions untold
That lay buried in this wonderful mine.

There were Doctor Le Breton
And the famous Nelson,
Rude, Conaut and Cook to the fore;
There were Newcomh and Brewer—
Miners skillful and sure—
To relieve this mine of its store.

They worked with a will,
To the extent of their skill,
Built roads and canals by the mill,
Laid out a town site,
And down by a dam site
Erected a sawmill in style.

When their money was spent
They rested content,
Expecting the spirits would come;
But the spirits were shy,
They did not come nigh,
And the two skilled miners went home.

Then wise men from the East
Decided to test
The truth of this wonderful story;
They selected a seer,
A mining engineer,
And fitted him out for glory.

To Cana he went,
With the firm intent
To find them hones or bu'st;
He surveyed the ground
And looked all around—
His report will explain all the rest.

The Maiden Mines.

A prospector just in from this district gives the Butte *Miner* the following acconnt of the mines: The placer mines of Maiden and Warm Spring gulches and tributaries, in Montana, are limited in extant. The gnlches are narrow, and where worked show that the pay streak is small. To one who has witnessed the mining out of Alder, Last Chance and Confederate gulches, the placers of Maiden seem small. The claims are large, the whole of the ground heing owned by a few persons. The advantsges of water for working are also limited, and, on the whole, the ontlook is not such as would entitle the camp to any very great notoriety in placer mining, since the situation is such that very few men can he employed to advantsge in working them. The depth to hedrock is shallow—from 6 to 10 ft.—and the work now being done is hy means of reservoirs, enahling a few honrs' rnn each day, with a small head of water. If, however, the pay channel is so rich that it will yield $25 to $50 per day to the man, as has heen represented in some Eastern journals, the dirt will pay to he taken out and hauled to a point where water may be had for washing. This way would employ quite a number of laborers, hut the practicability is doubtful.

COOKING FISH IN CLAY.—Fish cooked in clay are said to he very delicions. The way to do it is as follows: After preparing, cover the fish with clay two inches thick, and throw it into a hot fire. The clay hardens almost instantly, and the fish in its tough oven bakes throngh and through, retaining all its juices. The clay is then poked out of the fire, cooled with a dish of water, and a sharp stroke with a stick separates it from the fish. The fish's skin peels off with the clay, and the dish is ready. Brown hread and potatoes constitute the rest of the meal. A little experience will enable one to cook a fish perfeotly in this way.

Now and a Million Years Ago.

[Written for the PRESS by ALMARIN B. PAUL.]

I bave just come out of ths Indian Spring drift mine, whers men are battering at ths wash and shoveling up the debris of a million years ago, and for what? Gold! Seventeen hundred and eighty feet they have already dug up this old pliocene river, which averages in width, from sbore to shore, some 50 ft., unearthing not only gold, but elsphants' tusks—tnsks of ths wild boar, etc. Although accustomed to such scenes, I have never viewsd a mining sight which made so wide a chasm in my thoughts. A million or mors years ago, here roared ths crystal waters, as they poured over the rugged serpentine bedrock on which I stand, carrying with it not only the gold which today ws are so greedy to get, but bowlders and debris of a million years older than itself.

Along its banks roamed, and drank of its clsar water, ths mastodon, elephant and other animals tbat havs left their footprints, as it were; all now hushed, not only by ths lapse of ages, but by being buried beneath 325 ft. of lava, which nt some later day poured in fiery volume all over the northern portion of Butte county, Californis. The grandner of this sight becomes more wonderful when you mingle th oughts of the past and the present. Miners of the nineteenth century, with their many lights, delving, toiling and wearing away their physical and mental life in an old river bed for gold. And this is called the enlightened age of the world! Digging debris of ancient rivers, working, sweating, toiling over mastodon and elephants' tracks of a million years ago! Which, let me ask, had the most of nature's gifts—the mastodon of that age, which drank of the pure water and grazed upon the luxuriant grass, and basked in the daylight and sunshine and plenty, or the miners of the great enlightened nineteenth century now working there? There is no prssging back these reflections—they come unsought. When will we become sufficiently civilized to dispense with that for which so much of life is sacrificed? No matter how used, it is but the relic of barbarous ages. Unlike iron, copper, lead and the other useful metals, the greatest sacrifices of life and comfort are made for the precious metals, and they could be dispensed with with but little loss to the human family. All the other metals send civilization onward; gold retards it. When all this toil for gold and silver ceases, when the age becomes snfficiently enlightened to adjust the world's trade and commerce without it, and men and women csn lay aside the trinkets of barbarism, then may we boast of a higher civilization. But I have wandered off. These drift mines of Butte county are very interesting; some are high, some low, showing great physical disturbance; some are rich and some are poor in metal, and here comes a question: When was this gold deposited? These rivers show it to he long before man appeared upon the earth's surfacs; therefore, you may be sure when you start on one of these old heds that no man has ever heen panning there before you, and it is a great comfort to the miner to know that if the cream of a gold deposit ever was there, it is there still.

As I stndy these old rivers, queer thoughts come, and my thinking is sometimes thrown so much into chaos as to carry the impression to my mind that I know nothing respecting the deposit of gold that makes an absolute, unalterable law. Sometimes I see evidences that lead me to think we will yet find gold hy the ton, as native copper was found on Lake Superior 40 years ago. All things considered, these drift mines of Butte are more than interesting.

August, 1882.

A Quartz Mill and Wind Mill.

Nearly twenty years ago, when each and all of the thousand and one quartz veins in the surrounding mountains were supposed to he undeveloped Comstocks, what was known as the Humboldt Canal Company was organized in San Francisco to divert the waters of the crooked and slnggish Humboldt river from the natural channel into a canal, which was to convey them from Golconda down the valley about fifty miles to Mill City, where they were to be utilized in running quartz mills. Over thirty miles of the canal hed was excavated, and water was conveyed by it at one time to this place; but the mines were not developed as rapidly as the promoters of the canal enterprise anticipated, and the thirsty soil absorbed all the water which the dry atmoephere did not evaporate, and it was demonstrated that for months in the summer season, if all the water in the river was turned into the canal at its head, not a bucketful would reach its mouth, and Mill City remained in name only, a city of mills. Now, however, two mills are to he built at the proposed terminns of the canal. One is a five-stamp quartz mill, which Gould & O'Donnell are erecting, and the other is a turhine wind-mill, which is being built hy Peter Woolcock, proprietor of the Mill City hotel. The quartz mill will be located near the fonndry, and there will be an O'Hara roasting furnace attached to it for the treatment of hase and rebellions ores. The foundation is now heing laid, and the lumher for the superstrncture is arriving. The wind-mill will he an iron turbine, capable of pumping several thousand gallons of water daily. These mills will give the place a start, and its name will no longer be a misnomer.—*Silver State*.

The Engineer.

Still Further Evidence.

At a recent meeting before the London Physical Society, Mr. Bosanquet described his application of the Faure accumulator, charged by a dynamo-electric generator, to the working of laboratory apparatus instead of the usual Grove or other battery. The last result of his experiments is that the accumulators, charged for two hours, have sufficient energy to keep the apparatus employed running for a week, and hence it is unnecessary for him, as heretofore, to put up 30 Grove cells each day.

Prof. Perry observed that a well-made Faure cell, having the minimum laid on in a uniform coat, does not lose its charge nor develop local action, as is done by those accumulators in which the minium is put into holes in the plates.

Prof. Clifton described some ingenious devices adopted by him in lecture experiments on electrostatics. These consisted of insulating glass stems with glass cups, to hold sulphuric acid formed on the stems; also a form of key which, by rapidly succeeding contacts, brings the spot of light on the electrometer scale to rest without tedious swinging. He also described a form of lecture galvanometer, sine, or tangent, which could be readily shown in all its working to a large class, and exhibited a simple and inexpensive apparatus for measuring the focal length of a lens in six different ways, according to what is known about the lens. The results showed that the apparatus was very accurate in its indications.

The Growth of Railroads.—Notwithstanding all that is said about bad or oppressive management of railroads, their history during the last 20 years shows that the accommodations and facilities extended to all classes of patrons have been steadily increased, while the rates have been just as steadily diminished. This has been owing to the laws of competition and business, which force men and corporations equally to meet the wishes of those who deal with them, and to lower prices as competition increases. The 15th annual volume of Poor's "Manual of the Railroads of the United States," just published, presents an unusual array of interesting facts and statistics relative to the growth and development of the railroads of this country. According to Mr. Poor, the construction of railways in the United States in 1881 was the greatest of any year during its history, being 9,358 miles. But as great as was the construction during 1881, Mr. Poor believes that the year 1882 will show a still larger. He estimates that during this year not less than 10,000 miles will be built. The railroad mileage in the United States has grown from 52,914 miles in 1870 to 104,813 miles in 1881. Mr. Poor estimates that over 500,000 miles of railway will be required before the limit of necessary transportation facilities will be reached.

Utilizing Electric Storage.—The discovery of the Faure principle for the storage of electricity seems to have excited inventors all over the world, and bids fair to ere long eventuate in something really practical and valuable in this direction. In a lecture lately delivered before the Royal Institution of London, by Prof. Ayrton, on the storage of energy, the lecturer maintained that, making due allowance for the unnecessary waste due to the too hurried charging and discharging of a Faure accumulator, for a million foot-pounds of stored energy discharged with a mean current of 17 amperes, the loss in charging and discharging combined need not exceed 18 per cent.; and he affirmed that he has found it in some cases not to exceed 10 per cent. He makes the additional statement, from experiment, that 81 pounds of lead and red lead, charged and discharged, the discharge lasting 18 hours—6 hours on three successive days—represented in its discharge 1,440,000 foot-pounds of work, or one-horse power for three quarters of an hour. The resuscitating power of the Faure accumulator was found to be wonderful. After the 18 hours of discharge just referred to, it was found, after a few hours of insulation, that the accumulator could give a current of over 50 amperes. The phenomenon resembles the invigorating action of sleep.

Utilizing Wave Power.—There seems to be a very general effort, at the present time, to utilize all sources of mechanical power. The latest novelty of this kind is described by *La Nature*, and consists of an apparatus to utilize the force of waves. It is an invention of M. Gauchez. It has a float weighing from 35 to 95 tons, as may be required, connected with a bell-shaped compressor by means of ropes or chains which pass over suitably arranged pulleys. The float, of course, rises and falls with the action of the waves. When the float falls it raises the bell, which had been previously below the surface of the water, and as it empties itself of water, the air rushes into it through openings in the top. As the float rises again, the bell sinks, the water rises in it, and, compressing the air, drives it out into pipes which conduct it to reservoirs on shore, where it can be distributed as required.

Iron or steel immersed in a solution of carbonate of potash or soda for a few minutes will not rust for years, not even when exposed to a damp atmosphere.

Useful Information.

How All Can Have Good Vinegar.

The vinegar plant, as is well known, belongs to the genus of fungals (*Penicilium glaucum*), and is readily propagated by the following annexed recipe: Take half a pound of brown sugar and half a pint of molasses, simmer them in three quarts of water till well dissolved; then place the mixture in a wooden or stone pot, cover it over, and place behind the stove in a warm situation. In about six or seven weeks you will find floating on the top a tough, fleshy substance—this is the vinegar plant. The mixture will have turned to vinegar, but of a poorer quality than will be manufactured with its aid. Now prepare a mixture as before, and when coolish lay over it the vinegar plant. A bit of lath or shingle should be laid upon the mixture before placing the plant over it, as the vinegar is of a purer quality if the plant does not lie wholly upon it. Set it behind the stove or beside the range, covering it closely, and in two weeks or more taste it; if sharp vinegar, bottle it and continue your manufacture. The vinegar is of a dark color, but of a far better quality than is bought generally for cider vinegar, but which has never seen apples. It is probable that what is termed the "mother" is loosely allied to this plant, and might be employed by those who desire to produce a "vinegar plant" without delay. The cost of vinegar made in this manner is extremely small, and as it is a condiment so universally employed in culinary matters, we recommend it to our readers. We do not think there is anything deleterious in its properties, and it would certainly give a great number of families a large supply of vinegar who would be unable to procure it in any other manner. A small, wooden butter firkin would be an excellent utensil for the preparation of the mixture, as it could be covered tightly.

New Paint for Floors.—A new kind of paint, especially good for floors, is made out of water-glass. It unites not only the qualities of beauty and durability, but is also advantageous as a means of protection against the action of fire. In order to lay on a covering of this paint, first of all the floor is neatly cleaned, then any cracks or crevices between the boards that may exist are luted with a thick dough, made of water-glass and pulverized chalk or gypsum. By means of a stiff brush, a coating of water-glass of the consistency, say, of syrup is then spread over the floor. Again, in the same manner, a second coating is laid on, consisting of water-glass mixed with the desired color. It must, however, be a mineral color, from the fact that the alkalies of the water-glass commonly decompose vegetable colors. This coating having become dry, other layers of water-glass may be thereafter given, until the floor has taken on the required lustrous appearance. In order to give the surface a brightness indicative of polish, it is ground off a little, oiled, and thoroughly dried. In this way a coating for the floor is obtained which is very durable, since the water-glass is not worn away either by means of heat, or yet, on account of its hardness, by means of continued use. As regards beauty and utility, floors coated in this manner are found to be fully equal to the best lacquered or varnished ones.

Restoring Faded Flowers.—Place the flower in a small empty teacup or scent bottle. Half fill a saucer with water, in the center of which place the cup or bottle containing the flower, over which invert a tumbler, the top of which rests in the water, covering the flower in the cup and excluding the air. The effect is surprising; in a short time the faded flower will revive, the color return into the petals, which quickly expand, and the scent return as powerfully as when the flower is first plucked. Care should be taken that the flower does not come in contact with the sides or bottom of the inverted tumbler. I have applied a method, the surprising efficacy of which anyone can prove. A wiser head than mine can perhaps apply me with the cause of this effect.—*Flora, in London Field.*

Mucilage for Labels.—Macerate five parts of good glue in 18 to 20 parts of water for a day, and to the liquid add nine parts of rock candy and three parts of gum arabic. The mixture can be brushed upon paper while lukewarm; it keeps well, does not stick together, and when moistened adheres firmly to bottles. For the labels of soda or seltzer-water bottles it is well to prepare a paste of good rye flour and glue, to which linseed oil, varnish and turpentine have been added in the proportion of half an ounce of each to the pound. Labels prepared in the latter way do not fall off in damp cellars.

A scientific way of lighting pipes and cigars has been introduced in Paris under the name of *poudre de feu*. It consists of pyrophorous, which is preserved in a small tin case with a narrow orifice. When a little of this black powder is poured out on the end of a cigar, or on the tobacco in a pipe-stem, and then gently breathed upon, it becomes incandescent, and is in a condition to light said pipe or cigar. What next? Why, there are little tubes sold containing pellets of potassium, and they are recommended to the juvenile Parisians as a means of forming splendid Gregorian fire-works on any convenient piece of water.

A variety of beautiful colors, corresponding to those of the rainbow, can be imparted to zinc surfaces by a simple chemical application continued a length of time proper for the desired color. It is necessary that the metal be pure, and especially free from lead. It is therefore to be rubbed with silicious sand moistened with hydrochloric acid, then dipped in water and rubbed vigorously with blotting paper. The zinc is then immersed in three parts, by weight, of dry tartrate of copper in four parts caustic soda, with 48 parts distilled water, the whole at a temperature of about 50° Fahr. The colors will appear successively, in the prismatic order, according to the period of immersion. In two minutes the violet will appear; in three, dark blue; in four and a half, a golden yellow; in eight and a half, a red purple. Intermediate terms give intermediate tints. When colored, the zinc is well washed with water, and for greater permanence of color, may be varnished.

Furniture Polish.—A. Messer, of Berlin, dissolves three kilos of shellac in about 15 to 20 liters of pure spirits (alcohol), and then mixes this with another obtained by dissolving 100 grams of gun cotton in 100 grams of high-grade sulphuric ether, to which is added 50 grams camphor, and enough 96 % alcohol to completely dissolve the mass. This polish is finely rubbed up with linseed oil. To 100 parts of it, five parts of a saturated solution of camphor in oil of rosemary are then added. A very dilute solution of benzole in alcohol is used for polishing off.

Botanizing in Arizona.

A Natural Fern Conservatory.

A week ago, while clambering up a high, narrow and very rocky ravine, a turn in its course suddenly revealed just before me a half-open volume of nature's great library. It stood on end, and was slightly inclined backward against a high mountain. Its sides were of syenite, limestone, granite and quartz in superposed layers, capped with slate.

I have since conducted an officer from the Post, experienced in measurements, to the place, and obtained his judgment as to distances. We estimate the hight of the walls to be over 1500 ft., and the extent of spread and the depth to be each over 1,000 ft. Vertical furrows traverse each page of the book, also horizontal ones.

And the contents of the volume are on a par with its magnificence. Plants of the most robust form and brightest flowers cling to every ledge and peep out of every crevice. No sooner had I approached the bottom of the pages than I descried, for a marginal vignette, a beautiful shield fern not seen before west of Texas. Across the right hand page, near the bottom, proceeded a line of white-flowered shrubs, a new species of *leaphania*. Similarly along the left a new *draba*. A hundred feet higher the pages had for illustrations a large and rare *aspidium* on the left and a new species of *gymnolomia* on the right.

Pulling myself up by the aid of trailing shrubs, I found, in the next narrow rift, two more strange ferns. At about a thousand feet elevation three more ferns appeared. The ascent was now almost vertical, but excitement steadied hand and foot. Grasping the depending bushes where possible, and after making a place for my fingers in the rock clefts with my pick, I struggled on and up, dripping with perspiration, but greatly elated by the ferns and flowers discovered. About 50 ft. from the top the slate capstone jutted out several feet and forbade escape over the top, but it also displayed another strange fern. Sliding down with great peril, and several severe hurts, to a ledge about two-thirds the hight of the gorge, by good chance I detected a side entrance from the west, a narrow, tortuous way often blocked with debris or guarded by a thorny bush, but still a passage along the face of the nearly vertical wall for 1,000 ft. to a place of safety.

Next day Mrs. L. was conducted to this wonderful conservatory, and admitted by the side entrance. At every inward turn of the winding way her exclamations of delight were uttered, but at the outward curves the sheer precipice of 1,000 ft. below and 500 above, with a narrow way of only one or two feet wide, often caused momentary hesitation. But the glories of the inner vestibule of ferns can always be seen from these outer curves, appearing nearer and nearer, and the sight is too enchanting for botanists to resist.

Premonitions of a sudden storm, such as are often experienced in the mountains of Arizona in August, now were heard, and the long rolls of thunder reverberated down the cavern's length in quick succession and increasing loudness; but a sweet-voiced little bird hopped along just a few feet ahead and seemed a siren to lure us on. Suffice it is to say the inner recesses of the conservatory were visited, more of their treasures secured, and then a quick retreat was made before a torrent dashed down that gorge, carrying large trees and bowlders, and making a volume of sound that could be heard for miles.

This must be the richest natural conservatory of ferns in America, for in it we have collected 26 different species, many of which are new to Arizona, and perhaps some of them new to science. Specimens of all the doubtful ones have been sent on to Prof. Eaton, of Yale College, for determination.—*J. G. Lemmon, in Rural Press.*

Tanner's Canyon, Aug. 25, 1882.

Good Health.

Ladies and Vinegar.

Taken in moderation, there is no doubt that vinegar is beneficial; but in excess it impairs the digestive organs. Experiments on artificial digestion show that if the quantity of acid be diminished, digestion is retarded; if increased beyond a certain point, digestion is arrested. There is reason, therefore, in the vulgar notion, unhappily too often relied on, that vinegar helps to keep down any alarming adiposity, and that ladies who dread the disappearance of their graceful outlines in curves of plumpness expending into fat may arrest so dreadful a result by liberal potations of vinegar, but they can only so arrest it at the far more dreadful expense of their health. The amount of acid which will keep them thin will destroy their digestive powers.

Portal gives a case which should be a warning: "A few years since, a young lady in easy circumstances enjoyed good health; she was very plump, had a good appetite, and a complexion blooming with roses and lilies. She began to look upon her plumpness with suspicion, for her mother was very fat, and she was afraid of becoming like her. Accordingly she consulted a woman, who advised her to drink a glass of vinegar daily. The young lady followed her advice, and her plumpness diminished. She was delighted with the success of the experiment, and continued it for more than a month. She began to have a cough, but it was dry at its commencement, and was considered as a slight cold, which would go off. Meantime, from dry it became moist; a slow fever came on, and a difficulty of breathing; her body became lean and wasted away; night sweats, swelling of the feet and legs succeeded, and a diarrhœa terminated her life." Therefore, young ladies, be boldly fat! Never pine for graceful slimness and romantic pallor; but if nature intends you to be ruddy and rotund, accept it with a laughing grace, which will captivate more hearts than all the paleness of a circulating library.

Unfermented Wine as a Medicine.—The Paris correspondent of the New York *Times* writes: "During the past few years the Parisians have taken to the habit of visiting Suresnes during the vintage, not only to witness the curious spectacle of the *vendangeurs* at their work, but for the prosaic object of taking a purge. When the juice of the grape is first pressed out, before fermentation has fairly begun, the effect of the wine is like that produced by sweet cider when taken in considerable quantities as it comes from the press. Three or four glasses of new wine have the medicinal effect required, and its action is not accompanied by the colic or cramps produced by most of the purgative waters of Europe. Indeed, the effect produced is similar to that of a good dose of castor oil, and at the same time the medicine is very agreeable to the palate. Thousands of persons here have great faith in the sweet wine onre, and not for the world would they miss their annual visit to the wine-presses of Suresnes as soon as the vintage has been officially opened.

Granular Inflammation of the Eyes.—A prominent oculist says that the contagious Egyptian granular inflammation of the eyes is spreading rapidly throughout the country, and that he has been able in many, and indeed in a majority of cases, to trace the disease to what are commonly called rolling towels. Towels of this kind are generally found in country hotels and in the dwellings of the working classes, and, being thus used by nearly everyone, are made the carriers of the most dangerous, and, as regards its symptoms, most troublesome disease of the eye. This being the case, it is urgently recommended that the use of these rolling towels be discarded, and thus one of the special vehicles for the spread of a most dangerous disorder of the eyes—one by which thousands of workingmen are annually deprived of their means of support—will no longer exist.

Recipe for Curing a Taste for Liquors.—At the festival of one of our reformatory institutions a gentleman is reported to have said: "I overcame the appetite by a recipe given to me by old Dr. Hatfield, one of those good old physicians who do not have a percentage from a neighboring druggist. The prescription is simply an orange every morning half an hour before breakfast. 'Take that,' said the doctor, 'and you will want neither liquor nor medicine.' I have done so regularly, and find that liquor has become repulsive. The taste of the orange is in the saliva of my tongue, and it would be as well to mix water and oil as rum with my taste." The recipe is simple, and has the recommendation that it can do no harm, even if it does no good.—*St. Louis Medical and Surgical Journal.*

Frizzled Hair.—Putting up the hair of children in curling papers breaks and checks its growth; often pulls it out by the roots. Curling irons are fatal to the hair of both children and grown persons. The heat saps up the juice out of the fibers as effectually as fire or frost saps the vitality of a green branch, leaving but a dry, withered skeleton. The practice which hair dressers have of frizzing out the hair with a comb to make the most of it is one of the most cruel injuries that can be inflicted on the living hair. The comb cuts it in the act of frizzing it. You can test the truth of this by combing out the hair after it has been so dressed.

Passing Events

As will be seen by our "Mining Summary," there have been recently several rich strikes in the Sawtooth region of Idaho. That whole country about there seems to be a pretty rich one. It will not be many weeks now, however, before prospecting will have to be stopped there, owing to the cold.

In this State, a noticeable feature is the large number of small mines now being worked by individuals without corporation influences.

Just now is the season of fairs. The Mechanics' Institute fair, now in progress in this city, has more of a display of mechanical features than any other, most of those in the interior being devoted more specially to agricultural products, stock, etc. San Francisco, as the center of manufactures of the State, must necessarily show the best exhibit of manufactured articles.

EXPEDITIONS to observe the transit of Venus will soon be sent out by the German government to Connecticut, South Carolina, Costa Rica, and the Straits of Magellan. Each party will comprise two astronomers, a student and an assistant.

REV. MR. STROBALL, of San Francisco, was robbed of watch, chain and money while officiating at a camp-meeting near Wheatland, Yuba county.

Local Manufactures.

In local manufactures there is prosperity. This is a proposition that time and experience have proven to be correct. Yet it seems more difficult for the whole population of a small town to agree to start manufactories than to agree in politics. A great many people will agree that a certain manufactory ought to be started, but they will not agree to give it pecuniary aid before starting.

After a few men have got everything in running order, the others may flock in to share in profits, but comparatively few will put their hands in their pockets to start in with. People will talk for six months about "home industries," and if a meeting is called about organizing a home manufacture, they will come and listen to all that is said. But when money is called for, they will let theirs lie quietly in the bank, or put it into stocks, but will not risk it in trying to build up a legitimate manufacturing business.

It seems somewhat strange to say, but it is none the less a fact, that, speaking generally, the man who starts in to originate and lay out a new manufacturing industry among us in California is looked upon more as a speculator than a man who dabbles in mining stocks.

They are so much looked upon as speculators that they find it difficult to get credit, or to get financial help. In the interior, if a man has a passable character, and is steady, he can get grub, tools and output to go prospecting for a mine, without paying a cent, or giving security, while a man who wants to start in a new business of making anything not before made there, couldn't get credit for a week's board, and is looked upon with suspicion. His plans are carefully scrutinized, his conclusions contradicted, and his ideas pronounced visionary.

Every man who has ever tried to start a manufacturing establishment on this coast will relate the same experience of rebuff, procrastination, suspicion and discouragement. It is always up-hill work. Yet in every town there is a latent feeling that if home industries, in the shape of manufactures, were established there, the place would be more lively and prosperous. That if "capital" would come in it would get large returns. But the trouble is, when capital comes in the shape of a single capitalist, who wants cent per cent, not investments. He wants to lend his money on good security; and if the enterprise can build itself up and pay one per cent. per month, and then pay profit, well and good. If not, the security must come on.

In other countries people invest for the investment, expecting their money to yield them profit in this way. Here people expect to lend the money on good security, and have the manufacturer pay the interest anyhow, and trust to luck for his profits. The capitalist will not take an equal risk, but will take none at all, and the first profit comes to him direct. At the first sign of weakness he closes down, and that's the end of it.

This sort of thing did very well for a long time, but it will not do now. If people in small towns want to see manufacturing establishments in their midst, they must put their hands in their pockets and help start them. Talk will not do. Resolutions and meetings and circulars are as nothing to hard dollars. It is the dollars that are wanted in the end. Why not put them up first and do the talking afterwards. Of course, matters of this kind are not to be entered into without consideration, but at the same time it ought to be remembered that one manufactory brings others, and it is these things that build up towns, increase property values, enhance general prosperity, and enrich communities.

THE NEW ROUTE TO MONTANA.—The completion of the Northern Pacific railroad to a point 550 miles east of Portland, Oregon, furnishes shippers from San Francisco an unbroken line of transportation to western and middle Montana. Heretofore the only route from the Pacific coast has been from San Francisco via the Central Pacific and the Utah Northern railroad; but the latter road belongs to the Union Pacific railroad company, which has made freights from Ogden north, on Pacific coast products, prohibitory, with a view to favoring Eastern shippers, to whom special rates have been granted. The new route, via Portland, is rapidly being extended eastward, there being over 7,000 men at work.

A BLOCK of coal four feet wide, four feet high and 10 ft. long, weighing 12,900 lbs., was taken on a flat car to the Denver exposition to be exhibited. It was taken from a coal mine in Utah owned by the Denver & Rio Grande railroad company, who are now building a road from Salt Lake City east, to intersect their line to the Rio Grande. This company is at war with the Union Pacific, and rather than patronize or accept a favor from that road, they send the coal, which was mined a few hundred miles of Denver, north on the Utah Central to Ogden; thence west, on the Central Pacific, to Lathrop, California; thence south to Yuma and east to New Mexico, on the Southern Pacific; and thence north, on their own road, to Denver.

THE Southern Pacific Railroad tax suits were compromised at San Diego on a basis of $10,500 per mile.

The Denver Exposition—No. 4.

[Editorial Correspondence.]

Quite a number of important additions have been made, both to the mineral and to the machinery exhibit during the past week. A water-jacket smelting furnace has been set up in the building, but not fitted up for working. The furnace can be readily examined, and the method of its operation is fully explained. This furnace will be fully described and illustrated in a future letter. The attendance continues about the same.

Bowlder County and its Exhibit.

Directly to the north, and adjoining Gilpin county—described in my last—is Bowlder. This county, also, possesses many peculiarities, and many especial attractions. Bowlder county may justly be taken to represent the State of Colorado in miniature. It comprises mountains and plains, mining and agriculture, more fully than any other county in the State. Here golden grain and golden nuggets combine to create general prosperity. Broad fields and bonanza mines are bunched together, as, perhaps, nowhere else. One-half of the county produces the necessaries of life, while the other half yields its precious treasure to pay for them, and a bountiful surplus besides. The county also abounds in coal and iron. Like the State a part of which it is, it possesses scenic beauties which never fail to call forth expressions of wonder and delight from visitors and tourists. As the State holds within its borders one of our most wonderful mountain elevations—Pike's peak—so Bowlder county boasts of one of the loftiest points in the Sierra Madre range—Long's peak, which rises majestically over 14,000 ft. high, forming the northwest corner-stone of the county.

A Cultured People.

Bowlder boasts of its culture and its educational and religious privileges, which it claims are not exceeded by any other, even the most favorable portions of the State. Its salubrious climate and scenic attractions, added to its natural industrial advantages, seem to have attracted within its borders a more than usually desirable population. The State Legislature seems to have appreciated this high standard of excellence, in selecting the town of Bowlder as the most fitting seat for the State University, where the elevating and refining influences of that institution does not fail to add a benediction upon all that has preceded it.

As an evidence of the good taste and esthetic proclivities of its population, we would cite the names which have been given to its rivers, towns and mines. I will venture the assertion that there is not another county in the entire Union where such a beautiful nomenclature can be found. Let me cite: The principal river flowing east from the mountains is called the St. Vrain. The most important towns in the county are Caribou, Nederland, Sunshine, Magnolia, Balarat, Springdale, Saliua, Longmont, Belmont, Rockville and Eagle Rock. The most of these towns are provided with telegraph and telephone facilities, and are sought out as summer, or permanent residences, by well-to-do, intelligent and cultured people, who have lost no time in rearing up around them churches and schoolhouses to perpetuate the excellencies and memories which they have brought with them from their Eastern homes.

This same culture and good taste has also found its way into the mining camps throughout the county, and gives abundant evidence that the first-comers into those localities were an uncommonly honest and cultured, as well as an enterprising class of men and women. Even at the expense of tediousness, let me cite in evidence the names given to a number of mines, as I find them in a list before me: Golden Age, Blue Jay, Bald Eagle, Big Blossom, Evening Star, Excelsior, Gold Ring, Iron Queen, Longfellow, Ocean Wave, May Queen, Song Bird, Twin Blossom, Silver Queen, Little Alice, The Pet, Blue Bird, Red Cloud, etc. There is not a name before me, among those not enumerated, which is not in good taste. I would recommend this class of nomenclature to miners in other sections, particularly in some of the earlier mining regions of California.

Gold Placer Mining was Commenced

In this county about the same time it was inaugurated in Gilpin—some 22 years ago—and soon here, as there, led to quartz mining, by the miners following up their river diggings to rich quartz lodes. The same sudden check was given to that business here, as in Gilpin, by soon getting down to sulphurets, and an interval of comparative rest occurred, until smelting processes were introduced by Mr. Hill (now U. S. Senator Hill) and Prof. Pierce, both now of the Argo Smelting Works. The successful results of smelting soon led to farther prospecting, until the silver mines were discovered. Looking for rich silver ore led to one of the most interesting discoveries yet made in the mines of Colorado.

The Telluride Mines.

As they are rightfully called, from the presence, in most unusual quantities, of telluride ores. In this class of mines, gold, which is commonly found in combination with sulphur and iron, occurs with a kindred mineral, called tellurium, an exceedingly rare ore, but here found in the greatest abundance ever met with in any part of the world. In other countries this mineral occurs in thin seams or small bunches—so small in quantity as to render the ore a great curiosity. But here, much of the telluride occurs in wide veins, continuous in length and improving in depth. These ores form the richest gold mines in the county, which are worked, however, for gold and silver only, the tellurium being destroyed in the process as a waste product, it having no special commercial value. This class of mines is scattered all through the five principal districts of the county. These districts are in the lower portions of the county. Higher up in the mountains the tellurides disappear, the gold-bearing sulphurets appearing in their place, and the mines carry less gold. It is more than probable that these sulphurets may give place to tellurides when a great depth is reached, one on a level with the surface of the tellurids mines, which are found lower down the mountain. Red Cloud and Cold Spring were the first telluride mines discovered, and at once attracted the attention, not only of Colorado, but the mining and scientific circles of the entire world. These two mines are near by each other and parallel, the south wall of the one and the north wall of the other consisting of gneissic granite, the two mines being separated by a dyke of gray porphyry, 40 ft. thick at the surface, but only 36 inches at the depth of 400 ft. The Cold Spring mine is now down over 500 ft. It has produced large quantities of ore yielding from $3,000 to $5,000 per ton. The relative proportion of gold and silver being five ounces of the first to about 35 of the last-named.

Quite a Number of Telluride Minerals,

Several of which are new, are found in the mines of Bowlder county. Of these we have, first *sylvanite*, which may be called a gold telluride, and which is the richest of the series; is composed as follows: Gold, 24 83; silver, 13.05; tellurium, 56.31; the balance, 5 81, consists of iron, 3.28; sulphur, 1.82; zinc, .45; copper, .23, and silica, .32.

Hessite, another variety, which may be termed a silver telluride, is composed as follows: Silver, 59 91; tellurium, 37 86; iron, 1.35; the balance, .88 per cent., consists of gold, .22; copper, .17, and lead. 45.

There is also an auriferous hessite, which contains: Gold, 13.09; silver, 50.36; tellurium, 34.91.

Petzite is also an auriferous telluride, consisting of gold, 24.10; silver, 40.73; tellurium, 33.49, etc.

Native tellurium is also found: Tellurium, 96.91, the balance of 3 9 being made up of small quantities of no less than 10 different elements.

Altaite is distinguished for the amount of lead which it contains: Lead, 60.53; tellurium, 37.51, etc.

Several other varieties of this interesting mineral are found, as follows: Calaverite, coloradoite, lionite, ferro-tellurite, and tellur. Pyrites are also found. The two last named, and also colorndoite and lionite, are new, and found only at this locality. A telluride of mercury has also recently been discovered which is entirely new to metallurgical science.

The gangue rock in all the telluride mines is generally a hard, bluish porphyry, mixed with soft feldspathic matter, quite similar to the milling rock in Gilpin county. In the ordinary ores the telluride occurs in patches and streaks throughout nearly the entire vein matter. When there is any large quantity of non-telluride-bearing ore, it may be readily discovered and thrown out by hand sorting, if desirable. It was at first thought that all telluride mines would be found between granite and porphyry, as several of those first discovered were; but in the largest number known at this time both walls consist of granitic gneiss.

The telluride district, so far as discovered, occupies an area of about 13 miles in length by three in breadth. Within that district there are about 20 mines producing large quantities of very rich ore, upon some of which the miners have gone down from 300 to 650 ft. There are about 30 others, opened from 100 to 300 ft., with good working prospects. Very many others are just being opened. This is only the third instance in the history of mining where tellurides have been found in any considerable quantity, and this is by far the most important. A single mine in Bowlder has developed more tellurium than has ever been found in any other 10 mines in the world, outside of Bowlder. Hundreds of tons of this class of ore have been shipped to smelting works which contained from 5 to 10 per cent. of tellurium, and thousands which contained from one to six per cent. Pieces of ore of several pounds weight have been found which would assay 75 per cent. A large per cent. of the first-class milling ore carries from 15 to 20 per cent. of tellurium.

The Bowlder County Exhibit.

The exhibit of this county, like that of other localities, is quite characteristic of its mines. The minerals are grouped according to mines and districts. About 200 mines are represented. The leading silver mine is the Caribou, one of the first opened. In addition to about one ton of picked and ordinary ore, a splendid specimen is shown from this mine weighing 80 pounds and valued at $300. The mine has been opened about 10 years, and is now worked to the depth of 1,000 ft., having produced about $4,000,000.

The Poorman, in the same district, shows about 1,500 pounds of very rich ore, assaying about 800 ounces in silver. This mine produces a large amount of very fine smelting ore, carrying galena and gray copper. One shaft sunk on this vein to a depth of 60 ft. yielded ore from which $17,000 was taken without any drifting.

The Mountain lode also makes a very fine display of rich gold sulphurets, silver chloride and silver glance.

The Yellow Pine bids fair to become a notable property. It sends a ton and a half of good ore, including one 750-pound chunk of gray copper ore, beautifully veined with azurite, and all rich in silver. This fine massive sample has been broken in handling. The mine has opened

six tunnels—800 ft. in all—every tunnel in pay ore. The first-class smelting ore runs from 300 to 600 ounces per ton.

The Black Cloud sends two tons of ore—some large and splendid specimens. This property is quite extensively developed, showing a very heavy lode of smelting ore.

Until quite recently no tellurides have been known to exist outside of this county. But they have recently been found near Lake City, Hinsdale county, some 300 miles south of this point, but not in any regular vein. Small quantities have also been met with near Rico, in Dolores county, and in several other localities, and it is confidently expected that the study of the display of telluride ores from Bowlder will lead to the discovery of similar ores in many other sections of the State, where it is more than possible rich tellurides may now be thrown aside as worthless. Indeed, several visitors have already assured Mr. Thompson that they feel quite confident that they have met with them in other localities, where they have been discarded in large quantities.

Knife Blades.

Soon after the discovery of the rich telluride ores in this county, some of the miners in the adjoining counties, who had, perhaps, not realized quite so favorable prospects, were in the habit of denominating the telluride mines "knife blades," as indicative of the limited quantity and thinness of the ore deposits. Several owners of such mines have combined in hanging to the exhibition masses of telluride ores to show the size of their "knife-blade" mines. Among them we find one piece weighing 1,000 pounds, others 850, 700, etc. In some a width of vein of two and one half to three feet is developed. These masses of ore are piled up together and conspicuously labeled 'Knife Blades." These ores are from the Inter-Ocean, Prussian, Slide mine and Black Cloud.

The Gold Mines of Bowlder.

The leading free-gold mine in Bowlder is the Golden Age. This company has 105 pounds of specimen rock on exhibition in a glass case, valued at $8,000. Regular work upon this mine has been continued about two years. The mine shows from two to three feet of free-milling ore of fair paying quality. The company has a 20-stamp mill running. There are several mines of lesser note in the county which produce free-milling gold-bearing rock.

Most of the gold-bearing non-telluride lodes, however, are sulphuret mines, similar to those found in the adjoining county of Gilpin. There are several very fine exhibits of this character from Ward district. The principal display of this character is from the Niwot mine, which has been opened to the depth of 400 ft. The Nelson, Baxter and Celestial also make good exhibits. These ores are almost identical in character with the Gilpin ores. There are several tons of ore shown from this county, and the display is gotten up in good taste and in a manner well calculated to interest and instruct the student in mineralogy. Mr. Harold D Thompson is the commissioner in charge, assisted by Mr. T. H. Noland, especial commissioner for Jamestown.

Coal, Iron, etc.

Bowlder makes a very fine display of coal, iron ore, marble and building stone. The coals are lignite, but far superior to most lignites. They are also quite free from sulphur and iron, with a very low percentage of ash. The most extensive beds of lignite in the State are in Bowlder and Jefferson counties. They occur on the plains, or foothills, near the base of the mountains. Good fire-clay is also abundant. Some of the marbles of Bowlder are very fine, and take a high polish. This is specially true of species of breccia, which, when polished, presents a variegated and beautiful surface. The breccias, however, do not present any cleavage seams, although they are deposited in layers of greater or less thickness. But there is quite an abundance of ordinary variegated marble, which can be readily taken out in large slabs from natural cleavage seams.

An Iron Furnace.

An iron furnace was erected in this county a few years ago, at the Marshall, where coal and iron were found in immediate proximity. The furnace was not operated long, however, on account of the small demand for iron, which was supplied, at that time, in large quantity, and at a low price, from the breaking up of useless machinery, shipped out here from the Eastern States. The experiment, however, was highly satisfactory, two and a half tons of crude ore producing one ton of pig iron of very good quality. The fuel used was charcoal, at the rate of about 110 bushels to the ton of metal produced. The ore worked was wholly gathered from the surface of the ground, where many thousands of tons may yet be gathered of equally good quality. The ore is also found in beds and veins, and principally of the brown hematite variety. The time will soon come when this ore can be profitably worked, when it will be made to add largely to the aggregate products of the State.

But very few of the mines of Bowlder have as yet been worked to any great extent. There are but six or eight mills in operation. Most of the ore taken out goes to the furnaces. About 300,000 tons of coal are annually raised in Bowlder, valued at about $750,000. The value of the precious metals produced last year did not greatly exceed $600,000. W. B. Ewer.

THE United States steamer *Adams*, at this port, will be ready for sea in a few days. She will go to Alaska to relieve the *Wachusett*. The *Wachusett* will return to San Francisco, where she will be examined, and, if necessary, will be put out of commission.

Connection Between Tunnel and Surface

The first opening of a hydraulic mine is rather a tedious and expensive business; however, after a connection is once made between tunnel and surface, other necessary improvements are easily accomplished. For instance, the chimney represented as running up on a slope may be, if only short, changed into a vertical shaft, or, if long, into terraces, so that the gravel rushing down may be submitted to a crushing process, which a fall of 20 ft. or more will create.

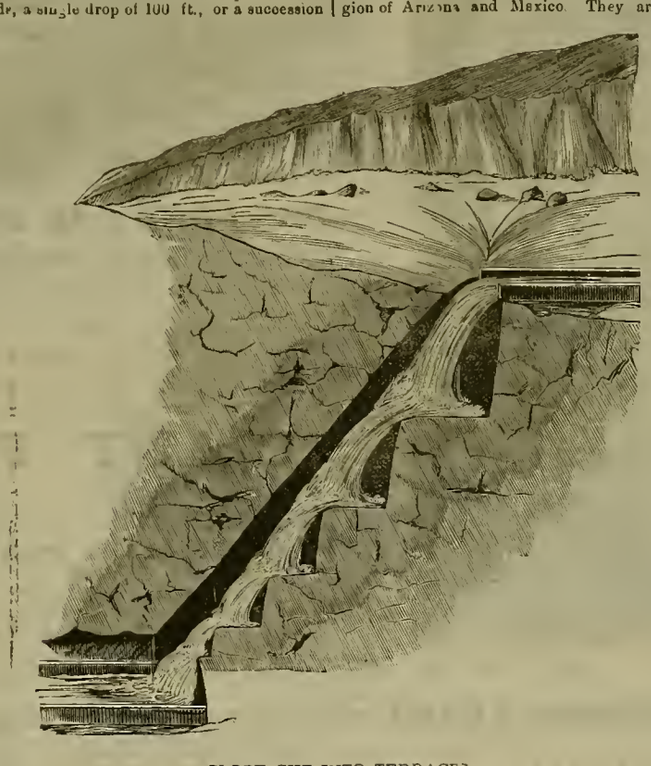
Where the bedrock between terminus of tunnel and basin is of considerable depth, a system of terraces will be more advisable than a vertical shaft, for this reason, not only that the sloping chimney is far more easily changed into terraces than into a vertical shaft, but also that the danger of blockading or choking is greatly lessened.

The terraces, as described by Charles Waldeyer, ought to be constructed in such a way that the first fall is the deepest, each successive one lessening as the tunnel is approached, so that the last fall is not more than a common drop of two or three ft., such as may be found on a line of sluice boxes.

The diagram given represents a slope of 100 ft. vertical hight, cut into terraces.

	FEET
The first fall represents	30
The second	25
The third	20
The fourth	15
The fifth	7½
The sixth and last, into the boxes	2½
Total	100

Whether a vertical hight or a slope—in other words, a single drop of 100 ft., or a succession



SLOPE CUT INTO TERRACES.

of drops of the same aggregate depth, will be preferable, is a matter open to discussion. It seems that a succession of blows of less force, but striking the matter to be crushed from different sides, must be more effective than one very strong blow. The benefit of a drop of even a few feet on the line of sluice boxes is well known to the miner, and a repetition of such drops must necessarily cause the repetition of such benefits, which consist in the crushing, stirring up, changing of position of the "pulp," and the consequent liberation and precipitation of the gold. By the time the tunnel is reached, the force of the several falls or drops is broken, and a leap of 30 inches lodges the running mass in the sluice boxes.

BOLIVIA COPPER MINES.—News has been received here of the sale of the Bolivia copper mines, in this county, to an Eastern company. These mines, which are said to be quite extensive, are situated about 70 miles south of Winnemucca, between Miller's ranch, in Pleasant valley, and the Humboldt salt marsh. It is said that smelting works will be erected in the district—which is heavily timbered—to reduce the ores.—*Silver State.*

THERE are 400 Cheyenne Indians in camp 80 miles south of Los Animas, Col. These Indians made application several days ago to be allowed to go north, and being refused, they now make the trip on their own responsibility.

THE first locomotive and the construction train crossed the Yellowstone last week, and its advent was greeted with much rejoicing by the citizens of Billings.

SPARKS from a locomotive at Cleveland fired 300 barrels of petroleum on the flats, the flames extending to a train of 15 oil-cars, causing a loss of $30,000.

Contributions to the Geology and Mineralogy of California.—No. 7.

[NEW SERIES.]

Origin of Loess

By WM. P. BLAKE, F. G. S.

H. G. Hanks, State Mineralogist, California:

The mode of formation of the deposits known by geologists as "Loess" is now receiving more than usual attention abroad. Several articles have appeared in the *Geological Magazine* of London, written by W. H. H. Howorth, and in the July number, Prof. Baron Richthofen, now of the University of Bonn-on-the-Rhine, has a letter giving full expression to his views upon this vexed question of the Loess, which is generally admitted to be one of the most difficult problems of geology.

Although no well-characterized deposits of Loess have yet been recognized in California, we have within the limits of the State certain deposits, at the least partaking of its distinctive peculiarities, and whose origin may throw great light upon the question of the origin of the Loess. In the dry lake system of the region west of the Rocky mountains of North America, we find phenomena which may be advantageously considered in a discussion of the origin of Loess.

Dry Lakes.

These dry lakes, or playas, as they are known [illegible] gion of Arizona and Mexico. They are also found in the Southern part of California. They have been described by myself [Report Geological Reconnaissance in California, 1855, pp. 216, 220, 225.] by Mr. Clarence King [Geology of the 41st Parallel. See also Report of Thos. Antisell for a description of *Playa de los Pimos*], and by others. They occupy the lowest portion of the basin-shaped depression between mountain ranges, forming nearly level plains of hard, dry clay, in the same position in their lowest portions that water would occupy if the precipitation were sufficient to keep up a supply. They are usually at the foot of long slopes, extending upwards at a slight, but increasing, angle to the mountain ridges. A succession of wet and dry seasons is required for their formation. The precipitation being confined chiefly to the mountain, torrents are suddenly formed, often, by the immense volumes of water known as "cloud bursts," which rush down the steep and confined canyons of the ridges, and spread out over the slopes. Materials, coarse and fine, are mingled promiscuously together, and are carried out upon the slope, where the water, spreading out in many channels, drops the coarser and heavier debris near to the mountains, while the finer and lighter portions are carried farther on to the lowest levels, and are there spread out in a temporary lake of shallow but muddy water. This water evaporates rapidly, and leaves a soft magma of mud, which soon dries up, and becomes so hard that wagons may be hauled over it without forming a rut. But in its soft and half-dried condition it is dangerous to venture upon it, and animals often become mired and lost in their efforts to reach water. This process of formation is now going by Mexicans and in California, constitute an important topographical feature of the Great Basin region and of the elevated mountain region year after year to an appreciable extent; and during the glacial era, or former periods of greater precipitation, the accumulation of clay was no doubt much more rapid than it now is. In places where the drainage into the basins is sufficient, we have permanent shallow lakes, with broad margins of clay, such, for example, as the sink of the Carson, in Nevada; and, in fact, we may include the whole lake system of the Great Basin, with its former great extension in Lake Bonneville, of Gilbert, and Lahontan, of King, and even the great lake valleys of California, such as the Tulare lakes and the Colorado. The phenomena are all connected, and there is an insensible gradation from the playas to the permanent bodies of water, of which Salt lake is the most extensive example.

But the conditions of sedimentation upon the playas are very different from those where the light debris is received in comparatively deep and clear water. In the thick muddy flood spread out over the dry floor of a previously formed deposit, there are no conditions favoring a sorting of the materials or regular stratification. By absorption of water, the old layers of clay near the surface become softened and incorporated with the new, and the junction is obliterated. In deep, and especially in saline water, where the subsidence of silt is more rapid than in fresh water, the process of sorting is more complete, and the coarser materials are deposited near the shores, while in the shallow flood of muddy water there is a promiscuous mingling of the sand and the fine materials, and they are spread out over a great extent of surface.

We may recognize in these peculiarly formed deposits of the playas a process of sedimentation differing greatly from that which is wholly aqueous. The origin of the playas may be said to be partly sub-aqueous and partly sub-aerial. The conditions and results throw great light upon some of the peculiarities of the lowest formation, for which no generally accepted explanation has yet been found.

Characteristic Peculiarities.

W. Riphael Pumpelly has described deposits in China, referred by himself and by Baron Richthofen to the Loess, which are cut up in a remarkable manner by ravines with nearly vertical sides, rendering the country almost impassable. In the Colorado desert of California we find similar conditions. The ravines are found in a vast deposit of calcareous clay or loam, which is clearly lacustrine in origin, though probably the ancient lake was shallow and was subject to great alternations of levels, so that the deposits were often exposed to the air, according to the season, whether wet or dry. The similarity of the topography of the true formation—the one, China described by Pumpelly, and the other in California, described by myself [Vide Geological Reconnaissance in California, where illustrations of the ravines in the clay are given], requires notice. In the recent communication of Prof. Baron F. Richthofen [On the origin of the Loess. The *Geological Magazine*, London, July, 1882, p. 295.] he enumerates 12 characteristic peculiarities of the Loess, which he insists any theory of origin must explain. For convenience of reference, I cite these in slightly abbreviated form.

1. "The petrographical, stratigraphical and faunistic difference of the Loess from all accumulations of inorganic matter which have been deposited previously and subsequently to its formation and are preserved to this day."

2. The nearly perfect homogeneousness of composition and structure, wherever found in Europe and Asia, contrasting with sediment deposited from water.

3. Its deposition independent of altitude above the sea. In China, from a few feet to 8,000 ft., or more, above the sea.

4. The shape of the deposits. "In hilly regions, if little developed, the Loess fills up the depressions between every pair of lower ridges, and in each of them presents a concave surface, but where it attains greater thickness, it spreads over the lower hills and conceals the inequalities of the ground. Its concave surface extends, then, over the entire area, separating two higher ranges in such a manner as to make the line of profile resemble the curve that would be produced by a rope stretched loosely between the two ranges." "This shape of the surface is precisely similar to that which is characteristic of the salt steppes of central Asia." It must, however, be remarked that, just as in these, the development is frequently unequal on either side of a valley, and that the preponderance of the deposit on the same side can sometimes be observed in each basin throughout a larger region. "The lowest portion of the surface of larger basins is frequently taken up by stratified soil consisting of the finest particles of Loess and exhibiting a strong impregnation with alkaline salts."

5. The composition of pure Loess, which is the same from whatever regions specimens may be taken, extremely fine particles of hydrated silicate of alumni being the largely prevailing ingredient, while there is always present an admixture of small grains of quartz and fine laminæ of mica. It contains, besides carbonate of lime, the segregation of which gives origin to the well-known concretions common to all deposits of Loess, and is always impregnated with alkaline salts. A yellow coloring matter, caused by a ferruginous substance, is never wanting."

6. "The almost exclusive occurrence of angular grains of quartz in the pure kinds of Loess."

CHICAGO **FRASER & CHALMERS,** ILLINOIS

MANUFACTURERS OF IMPROVED AND APPROVED FORMS OF

MILL AND MINE MACHINERY.

Having made extensive additions to our Shops and Machinery, we have now the LARGEST and BEST APPOINTED SHOPS in the West. We are prepared to build from the Latest and Most Approved Patterns,

QUARTZ MILLS

For working gold and silver ores by wet or dry crushing. The Stetefeldt, Howell's Improved White, Brunton's & Bruckner Furnaces, for working base ores. Rotary Dryers, Stetefeldt Improved Dry Kiln Furnaces.

SMELTING FURNACES,

Water Jackets, either Wrought or cast iron, made in sections or one piece, either round, oblong, oval or square. Our patterns most extensive in use. SPECIAL FURNACES FOR COPPER SMELTING. Slag Pots and Cars, improved form. Bullion and Copper Moulds and Ladles, Litharge Cars and Pots, Cupel Furnaces and Cars.

HOISTING ENGINES Large or Small for flat or round rope. Double Cylinder Engines, from 6x10 to 18x60. This latter size furnished J. B. Haggin for Giant and Old Abs Co., Black Hills also Corliss Pumping Engines, 26x60, for Hoisting and Pumping Works, for 2,000 feet deep. **Baby Hoists for Prospecting, 4 H. P. to 6 H. P.**

Wire Rope, Safety Cages and any Size and Forms of Cars.

Principal Office and Works, Fulton and Union Sts., Chicago, Illinois.

Frue Ore Concentrator, or Vanner Mills.

Coarse Concentrating Works, Improved Jigs, Crushing Rollers, Sizers, Trommels, Rittenger Tables, and all other adjuncts for the proper working of Gold, Silver and Copper Ores, complete in every detail.

HALLIDIE IMPROVED ORE TRAMWAYS. We refer to Gen. Custer mine, Idaho, 5,000 feet long; Columbus Mine, Col., 4,750 feet long; Mary Murpby mine, Col., 5,000 feet long, all in constant operation.

LEACHING MILLS,

Improved Corliss and Plain Slide Valve Meyer's Cut-off Engines.

CORLISS ENGINES from 12x36 Cylinders to 30x60. PLAIN SLIDE VALVES from 6x10 to 36x36. BOILERS of every form, made of Pine Iron Works C. H. No. 1 Flange Iron, or Otis Steel. Workmanship the most careful. All Rivets Hand Driven.

McCaskell's Patent Car Wheels and Axles—Best In Use.

New York Office, Walter McDermott, Manager, Room 32, No. 2 Wall St.

INGERSOLL ROCK DRILLS

AND

AIR COMPRESSORS

Mining Machinery.

For Catalogues, Estimates, Etc., address

Berry & Place Machine Company,

PARKE & LACY, Proprietors.

323 & 325 MARKET ST., SAN FRANCISCO.

Colorado Iron Works,

MANUFACTURERS OF

ENGINES, BOILERS, RAILWAY CAST AND WROUGHT WORK, BRIDGE WORK, BOLTS AND BOLT ENDS, BUILDING WORK, ETC.

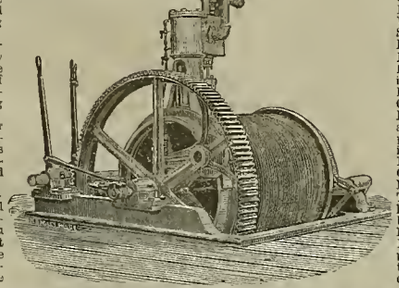
MINING MACHINERY A SPECIALTY.

Our manufactures of mining machinery embrace every kind of machine and appliance for the mining and reduction of ores.

We have had an experience of more than twenty years in the manufacture and practical operation of mining machinery in Colorado and the neighboring States and Territories.

Our facilities are superior to those of any manufactory in the West, our works having been recently rebuilt, greatly enlarged and completely equipped.

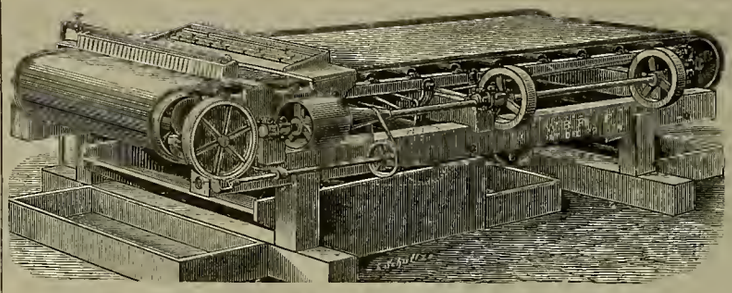
We invite the investigation of mine owners and mill men seeking machinery. We can furnish, on board, at our works, or set up at the mines anywhere in the Rocky Mountain region, on short notice, the following machinery: Cornish Pumps, Steam Pumps, Stamp Mills for Wet or Dry crushing, Pans, Settlers, Agitators, Retorts, Bullion and Ingot Moulds, Reverberatory Furnaces, Bruckner Cylinders, Revolving Roasting Furnaces and Dryers, Melting Furnaces, Concentrating Machinery, Rolls, Crushers, Conveyors and Elevators, Ore Samplers and Grinders, Hoisting Engines, Water Jacket Furnaces, Slag Pots and Cars, Lead Pots and Ladles, Blast Pipes and Water Tuyeres, Blowers, Cupellation Furnaces, Market Kettles, Wire Rope, Cages, Buckets, Skips, Ore Cars, etc. Estimates furnished and prices quoted on application. Send for illustrated catalogue.



COLORADO IRON WORKS,

P. O. Box, 1921, - - - - Denver, Colorado.

$1,000 CHALLENGE!



THE FRUE ORE CONCENTRATOR.

Nearly 300 are now in use, giving entire satisfaction. Awarded First Premium and Silver Medal at the Industrial Fair for 1880 of the Mechanics' Institute of San Francisco, Cal.

Saves from 50 to 100 per cent. more than any other Concentrator in use, and concentrations are clean from the first working. The wear and tear are merely nominal; water required is less than in any other wet Concentrator; the power required per machine is less than one-half horse power; the labor required is light, one man on a watch can attend to sixteen machines.

We challenge any other Concentrator in use for a fair and impartial competitive trial, side by side, for stakes of $1,000 each, and we mean business.

☞A machine with all improvements can be seen in working order and ready to make tests, at the office of Buckley, Spiers & Hayes, 220 Fremont street.

ADAMS & CARTER, Agents. Room 7 No. 109 California Street, S. F.

GIANT POWDER.

MANUFACTURED UNDER ALFRED NOBEL'S ORIGINAL AND ONLY VALID PATENT FOR NITRO-GLYCERINE POWDERS.

All Nitro-Glycerine Compounds, for instance, so-called HERCULES, VULCAN, VIGORIT, NITRO-SAFETY Powder, Etc., are Infringements on the Giant Powder Co.'s Patents.

THE GIANT POWDER COMPANY

Call Special Attention to their Improved Grades of Powder.

No. 1.—The most Powerful Explosive Compound now in use here.
No. 2.—Surpasses in strength any Powder of its class ever manufactured.
No. 3.—This grade is a Strong and Reliable Powder, which does excellent work.

JUDSON POWDER

Is now used in all large Hydraulic Claims, and on most Railroads. It breaks much more ground, and obviates reblasting by breaking much finer. TRIPLE FORCE CAPS AND ALL GRADES OF FUSE.

☞The Giant Powder Company have also purchased, from Mr. Nobel, the inventor of Nitro-Glycerine, his latest invention, known under the name of

NOBEL'S EXPLOSIVE GELATINE

This explosive is from 50% to 60% stronger than the strongest Nitro Glycerine Compound and impervious to water. Even hot water does not diminish its strength. We are now introducing the same.

BANDMANN, NIELSEN & CO., General Agents, 210 Front St., S. F.

LEFFEL'S IMPROVED WATER WHEEL.

PRICES REDUCED!

PATENTS REISSUED 1868.

The "OLD RELIABLE" with improvements, making it

THE MOST PERFECT TURBINE NOW IN USE.

Comprising the **Largest** and the **Smallest** Wheels, under both the **Highest** and **Lowest** head used in this country. Our new Illustrated Book sent free to those owning water power.

Those improving water power should not fail to write us for **New Prices**, before buying elsewhere. New Shops and New Machinery are provided for making this Wheel. Address

JAMES LEFFEL & CO., Springfield, Ohio, and 110 Liberty St., N. Y. City.

PARKE & LACY, Sole Agents, 21 and 23 Fremont St., S. F.

NEW YORK REFINING COMPANY'S

STANDARD COMPOUND

Machinery and Shafting Lubricants!

FINE CYLINDER AND MACHINERY OILS.

Brass, Copper and Zinc Lubricant Cups, New York Refining Co.'s Standard Axle Grease.

Carriage Lubricant and Leather Preservative; Skid, Gear, Belt, Elevator and Wire-Rope Grease, Car Journal Lubricant, Waste and Steam Packing, Sight Feed Cylinder Lubricators

EDWARD B. READ, Sole Agent,

Rooms 11 and 13, 18 First St., San Francisco, Cal.

Metallurgy and Ores.

THE CALIFORNIA POWDER WORKS.
MANUFACTURERS OF
Sporting, Cannon, Mining, Blasting and
HERCULES POWDER

HERCULES POWDER will break more rock, is stronger, safer and better than any other Explosive in use, and is the only Nitro-Glycerine Powder chemically compounded to neutralize the poisonous fumes, notwithstanding bombastic and pretentious claims by others.

It derives its name from HERCULES, the most famous hero of Greek Mythology, who was gifted with superhuman strength. On one occasion he slew several giants who opposed him, and with one blow of his club broke a high mountain from summit to base.

No. 1 XX) is the Strongest Explosive Known.
No. 2 is superior to any powder of that grade.
PATENTED IN THE UNITED STATES PATENT OFFICE.
ORDERS RECEIVED FOR HERCULES CAPS AND FUSE.
JOHN F. LOHSE, SEC'Y.
Office, No. 230 California Street - - San Francisco, Cal.

THE CONSUMERS' COMPANY.
VULCAN B B,
The Best Low Grade Explosive in the market. Superior to Black or Judson Powder.
VULCAN NOS. 1, 2 AND 3,
The best Nitro-Glycerine Powders manufactured. Having secured large lots of the best imported Glycerine at low prices, we are prepared to offer the mining public the very strongest, most uniform and best Nitro-Glycerine Powder at the very Lowest Rates.
SPECIAL INDUCEMENTS IN PRICES.
Vulcan B B Powder (in Kege or Caese) is Unequaled
For Bank Blasting and Railroad Work.
Caps and Fuse of all Grades at Bottom Rates.
The Central and Southern Pacific Railroads Use Vulcan Powder and no Other.
Vulcan Powder Co., 218 California St., S. F.
S. HEYDENFELT, - - President.
H. SHAINWALD, - - - Secretary.

Contains no Nitro-Glycerine or Chlorate of Potash, and is the only High Explosive Manufactured in America that does not contain these Dangerous Ingredients.

In Use for Seven Years Without a Single Accident.
TONITE POWDER CO.,
No. 310 California Street, - - - SAN FRANCISCO.

SHEET IRON PIPE.
FRANCIS SMITH & CO.,
Manufacturers of
THE PATENT CHANNEL IRON WHEELBARROWS.
THE STRONGEST BARROW MADE. These Barrows are made by Superior Workmen, and of the best material. All sizes kept constantly on hand
SHEET IRON PIPE.
Lap-Welded Pipe, all Sizes, from Three to Six Inches. Artesian Well Pipe. Also, Galvanized Iron Boilers, from 25 to 100 Gallons.
Iron Cut, Punched, and Formed for making Pipe on ground, where required. All kinds of Tools supplied for making Pipes. Estimates given when required. Are prepared for coating all size of Pipes with a composition of Coal Tar and Asphaltum.
Office and Manufactory, 130 Beale Street, San Francisco.
SHEET IRON PIPE.

STEEL CASTINGS
FROM 1-4 TO 10,000 lbs. WEIGHT.
True to pattern, sound and solid, of unequaled strength, toughness and durability.
An invaluable substitute for forgings or cast-iron requiring three-fold strength.
Gearing of all kinds, Shoes, Dies, Hammerheads, Crossheads for Locomotives, etc.
15,000 Crank Shafts and 10,000 Gear Wheels of this Steel now running prove its superiority over other Steel Castings.
CRANK SHAFTS, SHOES, DIES and GEARING specialties.

Concluded from Page 169.

7. The complete absence of stratification. To this must he added the singular position of the laminæ of mica. When these are deposited hy water, they are arranged horizontally, and accumulated in separate layers, while in Loess they are distrihuted without any order, and occur in every possihle position.

8. The capillary structure caused by the occurrence of innumerahle tuhes, mostly incrusted with csrhonate of lime, which have generally a vertical position, and ramify downwards like the roots of grass.

9. The tendency to vertical cleavage.

10. The faot that land shells are imhedded in immense numhers throughout the Loess, and that the most delicate shells are perfeotly preserved. Fresh water shells are of extremely rare occurrence, as has been correctly pointed out hy Mr. Howorth.

11. "The great quantity of bones of mammals found in the Loess, the genera and mostly the species, or next relatives, which are known to abound at present in steppes and on grassy plains. Herhivorous animals are represented as well as carnivorous preying on tbe former."

12. The fact that wherever Loess fills a basin hetween hills, the inclined slopes of these are covered by angular fragments of the adjoining rock on which the yellow soil rests. Layers of these fragments, beginning with a slight inclination and then passing into a horizontal position, extend from the hillsides for some distance into the accumnlation of the Loess itself, separating it inthe neighborhood of the encasing slopes into layers of varying thickness, while towards the central position of each large hasin, this separation ceases almost completely, and the soil is very homogeneous from top to hottom, even in those instances where the vertical thickness is 1,500 ft. and more.

In conclusion, he says: It is perfectly evident that no theory starting from the hypothesis of the deposition of the Loess hy water can explain all or any single one of these properties. Neither the sea nor lakes nor rivers could deposit it in altitudes of 8,000 ft. on hillsides. Origin from water is perfectly nnahle to explain the lack of stratification, the profuse existence of capillary tnhes, the vertical cleavage, the promiscuous occnrrence of grains of quartz, the angular shape of these, the confnsed position of the laminæ of mica, the imhedding of land ehells, and the hones of terrestial mammals.

He fails to find a satisfactory explanation of all these pecoliar characteristics of the Loess in the commonly accepted theory of lacustrine and fluviatile origin, and he propounds a theory of sub-aerial origin alone, attrihuting the formation to the slow hut constant accumulation of dust, carried by the wind until it is arrested by vegetation. He says: "There is but one class of agencies which can he called in aid for covering hundreds of thousands of square miles in little interrupted continuity, and almost irrespective of altitude with a perfectly homogeneous soil. It is those which are founded in the energy of the motions of the atmospheric ocesn which hathes alike plains and hilltops. * * * Whenever dust is carried away hy wind from a dry place and deposited on a spot which is covered hy vegetation, it finds a resting place, and may he washed off and carried further away hy the next rain if the ground ie sloping, or it may he joined to the soil if the ground is flat or slightly inclined."

For thie theory, Baron Richthofen claims he has the endoreement of Prof. Pumpelly [N. Y. *Nation*, April 14, 1878.], who had before advocated a fluviatile origin, and later, of Clarence King [By letter to Baron Richthofen.], at least for the Loess regions of the Mississippi hasin. M. Von Middendorff is also said to have changed his views in favor of the aerial origin. A great objection to this theory, which immediately occurs, is that we do not find any deposits of wind-driven clay forming at the present time. There are no examples known. All the deposits of wind-drifted materials are granular and arenaceous, without the agglutinating, binding nature of clay or loam. It is only the loose sands that are caught up and moved forward hy the wind in appreciable amounts. The presence of clay cements the grains of sand together and hinds them fast. The clay deposits of the playas, and of the old lakes, such, for example, as the hroad margins of the Tulares, are scarcely acted on hy the winds that sweep over them. The hard surface is swept clean of sand hy the wind-storms, and the sands are piled in hills, but the clay is not appreciahly worn away. The dust of wind-storme foragee on the steppes and deserts is slight in comparison with the amount moved in a eingle rainy season hy the floods issuing from the monntains and spreading over the plains. Any small amonnt of dnst that the wind may distrihute is more than returned to the playas and the lake heds hy the drainage.

[Continued Next Week.]

A little fire which had heen hurning gently in the woods on the eummit of the Coast range, in San Mateo county, ahout 10 miles from Redwood City, and five miles west of Woodside, developed into a furious conflagration last Saturday night, and has swept over a large area of country, destroying beautiful forests, and consuming houses, lodges and mills. The loss is hetween $50,000 and $100,000.

The town of Stockton, one of the first mining camps established in Utah hy General Connor, was destroyed hy fire on Sunday night. James Brown, merchant, was insured for $5,000. The rest is a total loss, amounting to $50,000.

Patents and Inventions.

List of U. S. Patents for Pacific Coast Inventors.

From the official list of U. S. Patents in Dewey & Co.'s Scientific Press Patent Agency, 252, Market St., S. F.

For the Week Ending August 29, 1882.

263,452.—Inhaler for Powders—John R. Adams, Oakland, Cal.
263,468.—Fire Escape—Jacob Bloomer, Boise City, Idaho Ter.
263 385.—Boot—Thos. H. Buckingham, S F.
263,493.—Miners' Lamp—Bernard Dobbs, Greenwood, Cal.
263,412.—Illuminating Basements—P. H. Jackson, S. F.
263,540.—Calendering Maceine—E. Landry, S. F.
263,541.—Skirt Protecting Coat—Katharine S. Lathrop, S. F.
263,414.—Ironing Board—W. W. Lemon, Collegeville, Cal.
263,415.—Coupling—S. Lightburne, Jr., S. F.
263,557.—Fumigating Machine—John McDermott, S. F., Cal
263,573 —Rotary Engine—John Patten, S. F.
263,429 —Hydraulic Dredge—H. L. Pike and A. W. Ferguson, Astoria, Oregon.
263,579.—Laying Artificial Stone or Concrete Pavements—E L. Ransome, S. F.
263 435 —Tongue Support—D Shelton, Santa Rosa, Cal.
263,436.—Candlestick—Chas. E. Sherman and L. Sachse Havilab, Cal.
263,667.—Music Stand and Cane—John G. Roberts, Morey, Nev.
263,406.—Submerged Pump—L. Herbert, Hicksville, Cal.

Notices of Recent Patents.

Among the patents recently ohtained throngh Dewey & Co.'s Scientific Press American and Foreign Patent Agency, the following are worthy of special mention:

Hydraulic Dredger.—Henry L. Pike and Albert W. Ferguson, Astoria, Oregon. This is an apparatus for dredging in harhors or rivers, and it consists of a pneumatic and hydraulic tank having nozzles which are so plsced that they will discharge a current or currents of water forcihly downward from the hottom when pressure is applied. The upper part of the tank is provided with an air chamber, and a flexible pipe has one end opening into the tank, while the other is led forward to a vessel hy which the tank is towed from place to place. Upon this vessel are two sets of pnmps, one for air, and the other for water. Each of these pumps is connected with the flexible hose, and a suitahle valve or cock enahles the operator to use either at will. When the tank is to he moved, air is forced in to float it. When it arrives at the place to he dredged, water is admitted (the air escsping), and it settles upon the hottom or har, heing hallasted for the purpose. The air connections being then shut off, and that with the water pumps opened, the pressure forces the water out through the nozzles in the hottom and loosens the mud, so that it will hs carried away hy the cnrrent.

Music Stand and Walking Cane.—John G. Roherts, Morey, Nye Co., Nevada. Dated Aug. 29, 1882. No. 263,667. This invention relates to a combined musio stand and walking cane; and consists of a tripod of folding legs with a central standard, all of which, when closed, are secured hy a peculiar ferule. The standard is vertically adjustahle, and has a crooked or curved end, with a guide support for its hack. The rack consists of a central piece tapering to its base and provided with a swinging enstaining leg or hrace. To its top are pivoted certain strips or hars, to which others are pivoted to form the rack. To its hase are pivoted the folding trough pieces with extension piecee to adjust their width. The strips are adapted to fold upon the central piece, and the trough pieces to fold over hoth, forming a neat and portahle har. The central piece of the rack is adapted to fit into and he sustained hy the guide support upon the hack of the main standard. The object of the invention ie to provide a portable music rack and stand, which, when heing carried, may be made to serve the purpose of a walking cane.

Coupling.—Stafford Lighthurne, Jr., S. F. No. 263,415. Dated Aug. 29, 1882. This invention relates to a device or attachment which is especially useful for making a water-tight connection with the smooth ends of pipes, hihs, hasin cock, and which is eo constructed that it will fit pipes of different sizes. It coneists of a peculiarly shaped elastic joint-former, which is enclosed in a case. The case is so formed as to slip upon the end of the pipe or cock, and is secured there hy a eet screw or other suitahle device. The lower end of this case is provided with any suitahle coupling for making connection with filtere or other connections, and its end is grooved or recessed to receive the edge of the elastic packing so as to give more spring, and preserve the shape of packing to make a tight joint with the opposite coupling end.

Method of Illuminating Basements.—Peter H. Jackson, S. F., No. 263,412. Dated Aug. 29, 1882. Mr. Jackson, who is an inventor who has ohained a numher of patents from the Government, now devises a method of illuminating hasements hy means of glazed tiles, and the method of fixing and supporting the framework in which they are set, so that tighter joints may he made, the danger of warping the casting overcome, and a stronger, neater and cheaper joint provided. This adds another to Mr. Jackson's inventions in the line of improving basemente of buildings.

Candlestick.—Chas. E. Sherman and Lonis Sachse, Havelah, Kern Co., Cal. No. 263,436. Dated August 29, 1882. This invention relates to certain improvements in candlesticks, and it consists of a suitahle hase having an elastic candle support fixed upon it, this support heing formed of wires or strips of metal hent in such a manner that the candle is, as it were, suspended hetween them. In connection with the device is employed a self-adjusting shade or reflector, which will maintain its position relative to the candle as the latter hecomes shorter hy hurning.

Boot.—Thos. H. Backingham, of Buckingham & Hecht, S. F. No. 263,385. Dated Aug. 29, 1882. This improvement in hoots consists in the fastening of certain parts and their combination to form the upper of a hoot. The object is economy in the cutting and simplicity in construction, with strength and comfort.

Agents Now Wanted.

Extra inducements will be offered for a few active canvassers, who will give their whole attention (for a while at least) to our business. Apply soon, or address this office, giving address, age, experience and reference.

DEWEY & CO., Publishers,
No. 252 Market St., S. F.

Our Agents.

Our Friends can do much in aid of our paper and the cause of practical knowledge and science, by assisting Agents in their labors of canvassing, by lending their influence and encouraging favors. We intend to send none but worthy men.

C. W. McCrew—Santa Clara county.
M. P. Owen—Santa Cruz county.
J. W. A. Wright—Merced, Tulare and Kern counties.
Jarro C. Hoag—California.
B. W. Crowell—San Luis Obispo and Santa Barbara counties.
H. H. McDonald—Solano county.
C. B Hube—San Joaquin and Amador counties.
G W. Holmes—Contra Costa, Solano and Sacramento counties.

Old Papers Wanted.

Twenty cents each will be paid for a limited number of copies of any of the following Nos. of the Mining and Scientific Press, if received soon at this office: No. 1, of Vol. 13, 1866; No 5 Vol. 18, 1869; Nos. 1 and 26, of Vol. 20, 1870; No. 1, of Vol. 22, 1871. Also, 10 cents per copy for Nos. 2, 3, 4, 7, 10 11, 12, 13 and 15, of Vol. 30, 1875. If any one who has filee of back volumes of the Press, which they may like to dispoee of at a moderate rate, will eend us a memorandum of tbo same and the price, we may be able, sooner or later, to aeslet in their disposal.

For Sale.

A twenty-stamp steam mill, complete and almost new. Also, air compreseore, drille and mining machinery. Anyone having a gold or silver mine warranting the investment, may buy this material on time by making month y or quarterly payments. Address, CHARLES E. SHERMAN, Havilab, Kern County, Cal.

Attend to This.

Our subscribers will find the date they have paid to printed on the label of their paper. If it is not correct or if the paper should ever come beyond the time denred), be sure to notify the publishers by letter or postal card. If we are not notified within a reasonable time we cannot be responeible for the errore or omission of agents.

How to Stop this Paper.—It is not a difficult task to stop this paper. Notify the publishers by letter. If it comes beyond the time desired you can depend upon it we do not know that the subscriber wants it stopped. So be eure and send ne notice by *letter*.

Sample Copies.—Occasionally we send copies of this paper to persone who we believe would be benefited by subscribing for it, or willing to aseist us in extending its circulation. We call the attention of euch to our prospectue, terms of subscription, etc., and request that they circulate the copy sent.

Remittances to this office should be made by postal order or registered letter, when practicable; cost of postal order, for $15 or less, 10 cts.; for registered letter, in addition to regular postage (at 3 cts. per half-ounce), 10 cts

By Telephone.—Subscribers, advertisers and other patrons of this office can address orders, or make appointments with the proprietore or agents by telephone, as we are connected with the central syetemin San Francisco.

Gould & Curry Silver Mining Company.

ASSESSMENT, NO. 43.

Levied	August 24
Delinquent	September 28
Day of Sale	October 19
Amount per Share	Fifty Cents

ALFRED K. DURROW, Sec'y.

Office—Room 69, Nevada Block, 309 Montgomery St.

Bullion Silver Mining Company.—Location

of principal place of business, San Francisco, California; location of works, Gold Hill Mining District, Storey County, Nevada.

Notice is hereby given that, at a meeting of the Board of Directors, held on the first day of August, 1882, an assessment (No. 29) of Fifty (50c) Cents per share was levied upon the capital stock of the corporation, payable immediately, in United States gold coin, to the Secretary, at the office of the Company Room 3, No. 325 Montgomery street, San Francisco, Cal.

Any stock upon which this assessment shall remain unpaid on the fifth day of September, 1882, will be delinquent, and advertised for sale at public auct'on; and, unless payment le made before, will be sold on WEDNESDAY, the 27th day of September, 1882, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Directors,

J. M. BRAZELL, Sec'y.

OFFICE—Room 3, No. 328 Montgomery street, San Francisco, California.

"THE $1,000 CHALLENGE"

Ore Feeder for Quartz Mills.

OVER 800 ARE NOW IN USE, GIVING ENTIRE SATISFACTION.

Awarded First Premium at the Tenth and Twelfth Industrial Fairs of the Mechanics' Institute.

Twenty Per Cent. More Ore Crushed with Fifteen Per Cent. Less Wear of Iron than by Hand Feeding.

The accompanying cut illustrates the recently introduced Grip, and also the Spring Attachment, which replaces the Weight heretofore used, and which are obvious improvements.

It is now fully demonstrated, after careful and long continued experimentation and practical use, that the plan upon which a perfect Ore Feeder must be constructed is that of a carrier, and not that of a shaking table. Uniform and accurate feeding is not possible upon the latter plan. The ore must be evenly carried, upon a steadily advancing plane or table, to the line of discharge, and there simply dropped. Jerky or spasmodic contrivances will not answer the purpose for wet or sticky ores.

The Challenge Ore Feeders are now in Use in the following Mills, besides many others

Superiority of the "Challenge" Ore Feeder Demonstrated!

At the "Christy" Mill, Uintah County, Utah, the "Eclipse" Feeders, (conceived by E. Coleman) were introduced, but not carrying a regular supply of ore for the crushing capacity of the stamps, were replaced by the "Challenge," which are now running and the stamps crushing forty (40) per cent. more ore than was done by the "Eclipse."

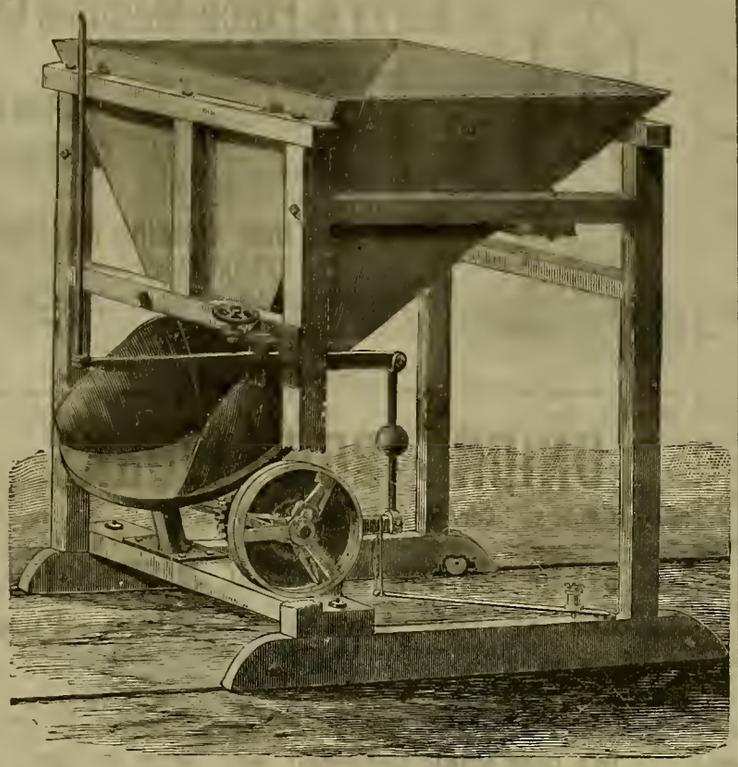
The "Harshaw" or "Hermosa" Mill, of Patagonia District, Arizona, was also originally fitted with "Eclipse" Feeders, but after a few weeks trial they were pronounced inadequate to the work, discarded, and the "Challenge" adopted.

The "Silver King" Mill of Arizona, also removed the "Eclipse" Feeders to give place to the "Challenge."

The "Sola" Mill, of Brown's Valley, Yuba County, Cal., was fitted with "Victor" Feeders, manufactured by E. T. Steen, but proving insufficient, the "Challenge" Feeders were substituted.

Four of the "Victor" Feeders, manufactured by E. T. Steen, were also placed in the "Alexander" Mill, at Grantsville, Nevada, but after a fair trial were discarded, and Hendy's Feeders fitted, and four others of the same pattern added when the second twenty stamps were erected.

These cases are simply cited from among many similar instances, in proof of the vast superiority of the "Challenge" Feeders over all others.



JOSHUA HENDY, Agent,

Machine Works 49 and 51 Fremont Street, San Francisco.

Manufacturer of Quartz, Saw Mill and General Machinery. Also Agent for BAKER ROTARY PRESSURE BLOWERS, and WILBRAHAM ROTARY PISTON PUMPS. P. BLAISDELL & CO.'S Machinists' Tools. HOT POLISHED SHAFTING from the Akron Iron Company, of Akron, Ohio.

Dealer in New and Second Hand Engines, Boilers, and all Descriptions of Machinery.

Reports, Surveys and Plans of Mines made.

DEWEY & CO.'S

Scientific Press Patent Agency.

[ESTABLISHED 1860.]

Inventors on the Pacific Coast will find it greatly to their advantage to consult this old experienced, first-class Agency. We have able and trustworthy associates and Agents in Washington and the capital cities of the principal nations of the world. In connection with our editorial, scientific and Patent Law Library, and record of original cases in our office, we have other advantages far beyond those which can be offered home inventors by other Agencies. The information accumulated through long and careful practice before the Office, and the frequent examination of Patents already granted, for the purpose of determining the patentability of inventions brought before us, enables us often to give advice which will save inventors the expense of applying for Patents upon inventions which are not new. Circulars of advice sent free on receipt of postage. Address DEWEY & CO., Patent Agents, 252 Market St., S. F.

A. T. DEWEY. W. B. EWER. GEO. H. STRONG.

ASTHMA. The greatest proof of the genuine merit of an article can be found in the amount of patronage it receives, and the thousands of testimonials respecting Dr. Hair's Asthma Cure, proves most conclusively that it is all that it is represented to be.

Dr. Hair's Treatise on Asthma and Hay Fever contains a list of cures from every State and Territory in the United States, also from every Dominion of Canada, England and Scotland. Treatise sent free, address Dr. B. W. HAIR & SON, Cincinnati, Ohio.

COPP'S AMERICAN MINING CODE.

United States, State and Territorial Mining Laws, and Land Office Regulations; Digest of Land Office and Court Decisions; List of Patents issued, and Dr. Raymond's Glossary, with Forms for Mechanics' Liens, Location Notices, etc.

Price, postpaid, in paper, 50 cts; in cloth, $1.25.

Sold by DEWEY & CO., S. F.

Mining Books.

Orders for Mining and Scientific Books in general will be supplied through this office at published rates.

GOLD SAVED

BY USING MY

SILVER PLATED AMALGAMATING PLATES.

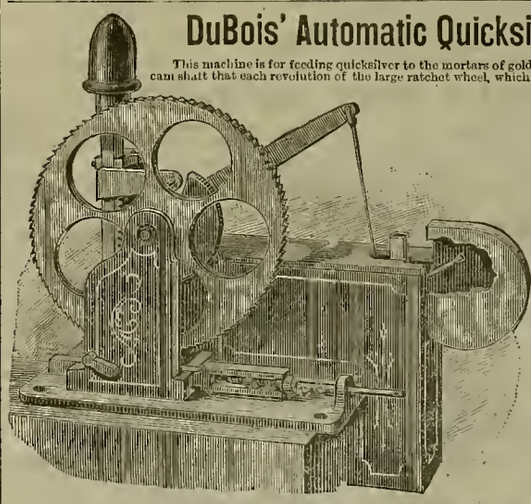
These Plates are used in Quartz, Gravel and Placer Mining with gratifying success. I am constantly filling orders for them, and when once used they prove themselves so superior to any other process yet discovered for saving Gold that my customers would not do without them. I have the best facilities on this coast for filling orders for these plates, and will guarantee my work. Old Mining Plates Bought, Taken in Exchange for New, or Re-plated.

Pacific Gold, Silver and Nickel Plating Works,

Send for Circular **101 and 103 Geary St., Corner Dupont, San Francisco, Cal.**

W. E. SHEPMAN, Proprietor.

DuBois' Automatic Quicksilver Feeder.



This machine is for feeding quicksilver to the mortars of gold mills. It is so connected to the cam shaft that each revolution of the large ratchet wheel, which can be regulated to revolve once in one, two, three or four minutes, as desired, dips a small cup into a reservoir of quicksilver, and by a trip of the cam, empties the contents into a pipe leading down to the mortar, supplying an exact quantity at regular intervals, superseding the ordinary hand feeding, which is of necessity subject to great irregularity, and liable to neglect. It renders the amalgamation of all the gold in the pulp equally certain and perfect.

The mechanism to produce this depression and elevation of the cup, is driven by the cam shaft, similarly to the self-feeders, over which so much ingenuity has been expended to regulate the delivery of ore to the mortar. As it is to be desired to have the ore go in constantly and regularly, so it is equally desirable to have the mercury fed constantly and regularly.

A chief point of excellence of this machine is, that it allows the quantity of mercury which would be otherwise fed in mass, in one hour, to be subdivided into a number of small portions, and fed almost continuously; i. e., from every one to four minutes.

Price, complete, $75.

For Sale by **WHITNEY & MARSHALL,** Sole Agents

22 & 24 Fremont St., San Francisco.

Dealers in Iron, Steel, Hardware and Mining Supplies, Wrought Iron Pipe and Fittings, Pump Columns, Wire Rope, etc. A large stock of Boiler, Plate and Sheet Iron of every description.

NO. 7 IMPROVED

AIR COMPRESSOR.

SPECIAL ADVANTAGES.

Absolute certainty in the action of the valves at any speed. Perfect delivery of the air at any speed or pressure. The heating of the air entirely prevented at any pressure. Takes less water to cool the air than any other Compressor.

Power applied to the best advantage. Access obtainable to all the valves by removing air chest covers. Entire absence of springs or friction to open or shut the valves. No valve stems to break and drop inside of cylinders.

Have no back or front heads to break. The only Machine that makes a perfect diagram. No expensive foundations required. Absolute economy in first cost and after working.

DISPLACEMENTS in air cylinder perfect. Showing less leakage and friction than our competitors and a superior economy of about 20 per cent.

Small Sizes made in Sections not to Exceed 300 lbs.

[NEW SERIES.]

Wind-Driven Depoeits.

By Wm. P. Blaka, F. G. S.

H. G. Hanks, State Mineralogist, California:

Residents of California are familiar with wind-drivea materials and deposits, and in San Fraacisco have them at their very doors. The most extensive examples are the sand-hill area stretching across the peninsula of San Francisco from the ocean-beach to the bay, through "Happy valley," and tho sand hills of tha Colorado desert, and of the pass of San Gorgonio, where the oatting effects are very strikiag, aad have heen described; these are granular aad loosaly coherent, aad are without any appreciable mixture of olay.

In tha Rooky Mountain region tbe heet exampla with wbioh I am familiar, ia opon the eastern side of the San Lnie valley or park, on the western flaak of the Sengre de Cristo range. Here, at altitndes of 5,000 to 6,000 ft. or more, the rocky asperities of the monntain-sides ara covered and emoothed over hy a deposit of fina aand which haa been carried up from the San Luis lakea or their deeiccated beds hy tha prevailing winds. This eandy formation is covered with forests, and is not without fertility, bnt its granular eandy natnre is evident, and it hears no reaemblance to the horizontal formation of Loees. It ie, however, the beet example of which I have any knowledge in favor of the auh-aerial theory.

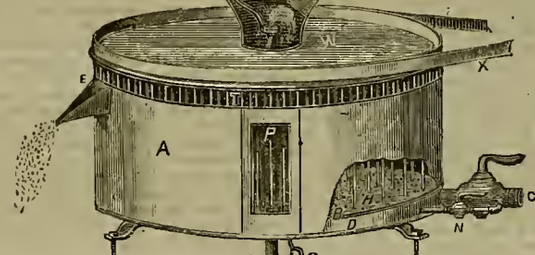
A similar objection, that we do not fiad soch accamulatioae now going on, hae haa heen raieed hy Mr. H. H. Howorth, who soee in the Loess formation the evidencee of a great poet-glacial flood, and an ontpouring of volcanio mnd. [*Geological Magazine*, Janaary to Jaly, 1882.] This anggeets a carefnl consideration of the phenomena of the pipe-clay depoeits of our ancient rivers—depoeits which, however, are much more ancient than the deposits of Loees.

A full stndy of the formation of playas, and of the processee of sedimentation of rivera subject to overflow, and in shallow lakea in regione wherc there ie an alternation of wet and dry seasone, will, I think, give a satisfaotory explanation of all the phenomena of the Loeee. Tbe deposite of the dry lakee of California and Nevada differ from all other eedimente. They have, in general, the eame composition coneisting chiefly of clay and fine material miscihle in water. They are formed at all elevatione aad where permaneat rivere do not exiet. They fill depresaione hetween rangee of monntaine, aad, joiniag in placee ineeneihly with the elopee from the high ridges, present the concave enrface deecrihed hy Baron Richthofen, in hie fonrth poetulate. And the observed preponderance of the depoeit on one eide or the other of a valley finde explanation in the greater floode in the higher rangee on the eide exposed to tbe greateet precipitation, or on thoee heet aitnated to receive the precipitation during the wet eeason.

Dnring the dry eeason, the exnanee of olay is under atmoepherio influencea and ia enbject to the accomnlation of more or leee wind-driven eand, which, in the next period of flooding, hecomee mixed with the clay. Sand ia also hrought down more or leee with the floods. As the water driee np, more or leee vegetation epringe up on the eurface, and ie alwaya found aronnd the horders of the dry lakes, wherever eufficient moietnre continnee thronghout the eeason. Thie may account for the tnhee found in the Loeee, ramifying like rootlets. The 10th and 11th propositione are exactly met hy conditions of formation of the dry lakee. So, also, the 12th ie eatisfied hy the dietrihution of the materiale of the alopes, the coareer portione eometimee overlapping the finer, when an exceeeive flood hae carried the coarser debrie farther from the ridgee than usual. Wherever land shelle oocnr upon the elopee or npon the vegetation of the hordere of the dry lakes, the periodic floode would of necessity eweep them onward and entomb them in the clay. So, also, the bonee of mammale may be ewept before tbe rneh of water and he left in the clay, together with thoee of animals mired in the endeavor to reaob water or aaline deposits, when the water is drying up. Wa may axpect to find scales of mica in all positione, they heing dissemiinated in the thick mnd and not heing free tosettle as they would in clear water.

Baron Riobthofen has bsen lead to hie conclasioas chiefly hythe stndy of the Loesedepoeits of Chins, and hie views have heen given more fnlly in hie work npon China—Vol. I, pp. 56 to 189—to which he refers in his article. I regret that I have not heen ahle to refer to this work. Mr. Pumpelly's deecriptions of the same deposits are given in hie memoir already cited, pnblished hy the Smitheoaian Iastitntion. There ie, in addition, a paper hy this anthor, on tha eource of the dnst required to form snch vaet depoeits, in the *American Journal of Science and Art*, Vol. XVII, 1879, p. 133.

Although I am familiar witb the dust-storme, or "eimoons," of the Colorado desert, and along the Colorado at Yuma and at Castle Dome, and in Arizoaa, I am not able to recognize in them a potency eqnal to the formation of depoeite like the Loess. That there ie a tranelation by the winde from one part of the deeert to another of a large amount of duet, ae well ae eand, dnring the lapse of ages, there cannot he any question, hut thie ie alight compared with the amount moved hy rains and etored in sediments in interior haeiae, as has heen ehown in the case of the dry lakee. Theee deeert areae are subject to rain-etorms and endden floode in the "dry waehee" or ohennels that intersect them [It may here he noted that laet winter the enrtece of the Colorado deeert wae covered hy enow to a depth of eix inchee, or more—a moet unueual ocourrence.], and ench etorme collect and carry off the duet; wherever an outlet to rivere and the eea exiete, or to a permanent interior lake, all euch wind-driven dnet ia washed off, and much more with it, and ia deposited in eediments in the nenal form. And thie, too, must he the oaee where the aerial duet finde lodgment upon a enrface covered with vegetation, the loee hy degradation heing far greater than the gain hy the depoeition of duat. Vegetation, to the extent reqnired to arreet and retain duet, enppoeee of neceeeity a region of raine, and in all ench regiona there ie a constant wearing away of the eoil. It ie, therefore, difficult to conceive of the growth of euch areae hy wind-driven deposite.



METCALF'S RAPID ORE CONCENTRATOR.

I am conetrained to disoent from the enh-aerial theory and to adhere to the theory of fluviatile and lacnetrine origin, believing that in the phenomena of eedimentation in *shallow* water, whether in playae or on the hordere of lakee or rivere, we have an explanation of all the peculiaritiee of the Loeee.

I am not prepared to admit that the Loeee deposite are everywhere identical in their characteristice, nor that they are absolutely without etratification. In the Loeee of the Missouri, at Kaneas City, for example, which in general hae the peculiaritiee named hy Baron Richthofen, except the preeence of land shelle and bonee, there ie obscure etratification, recognizahle only when etanding at eome distance from the hanke, wbere cnt through by the etreets. Cloee inepection faile to detect any layers or lines of parting. Tha vertical cleavage is strongly marked and the calcareous tnhes and oonoretione occnr. It is a eandy, ferruginona loam, and is extenoively need without admixtnre for the mannfacture of hrick. The depoeits of the river now forming are not appreciahly different, except as to the coaoretione and rootlete which we may readily expect to find oaly in euoh portione of the depoeits ae are expoeed to the air.

Mill Rock, New Haven, Auguet, 1882.

Dry Ore Washer.

Mr. Patrick W. Reardon, of San Joee, Cal., has jnst patented, through the Mining and Scientific Press Patent Agency, a dry washer or dry ore eeparator, which hae some novel featnree. To secure the heet reealte, the inventor prefers to first enitably grade ore, by meane of screens, hefore feeding it. It ie put ia the hopper, and the feed ehaft, with ite flangee revolved hy pulley and shaft, will permit hat a certain quantity to pasa through the throat at a time, thue avoiding an ererorowding of the riffle-box. The ore falle through the throat over the width of the hottom plate of a flat pipe. By the operation of a hlower and a preeenre hlower, a steady sheet of air is forced throngh the pipe againet the ore, which ie therehy carried into the riffle-box and againet the face of the first riffle. Here an elaetic huffer or roller acte ae a cuehion, and the ore drope down, the heavier oonoentratione lodgiag in the curved face of the riffle, while the lighter partiolee are thrown up hy the current of air and forced npward throngh an undnlating paeeage and down to the next riffle, where more concentratione are saved, and eo on throughout. The npward inclination of the entire riffle-hox, ae well ae the inclined riffiee, adde to the reenlt hy caneing the heavier particlee to roll hack or lodge, while the lighter onee finally reach the diecharge end. In addition to thia, the ore ie kept agitated within the riffle-hox hy the revolntion of a tappet-wheel, which, hy knocking againet the tappet-har, caneee the latter to knock againet certain oleate, and thne impreee the flexihle hottom of the riffle-hox. Thie has a eettling tendency npon the ore. By meane of valves, the intensity of the air current may he regulated, adapting it to varione gradee of ore.

The "Rapid" Ore Concentrator.

There is shown in operation at the Deaver exposition, a recently patented concentrator, an illnetration of which ie shown on this page. The inventor is Mr. G. A. Metcalf.

The engraving will fnrnish the reader with a fair idea of the appearance of the machiae. Mr. Metcalf eecnred hie patents only laet March, and is but now introdacing hie invention. Ae heing a matter of general interest, we give herewith a short deecription of its workiags.

The firet principle that led Mr. Metcalf to his invention wae the eeparation of the heavier metals from eand or crnehed qnartz, hy the difference of their epecilo gravity in water.

The improvement ie emhodied in a taak, or vessel, having near its hottom a finely perforated diaphragm, *B*, adapted to support the mass to he operated npon; a water epace, *D*, and inlet thereto, *C*, beneath the diaphragm, so ae to give a regulated upward carrent of water, nnder a preeeure, through the fine perforatione, and a rotary etirring apparatae adapted to aot continuously, and at all pointe in the maee, to agitate it while the water flowe upwardly through it. Thne, the lighter materiale are gradnally carried toward the top of the tank, where they overflow, or paee off hy the gate, *E*, while the heavier, or more valuahle metal, remaine, or ie withdrawn continnoaly through the gate, or gates, *F*. In order that the entire maee may he acted upon equally, without the formation of channele hy the water through it leaving parts nndietnrhed, there ie a rotary agitator, conoieting of a head, *W*, filled with downwardly projecting pronge, which penetrate the maee from top to bottom, and continuonely etir it, eo ae to hring new material directly into the path of the eeveral jete with every revolution. In ehort, the material ie received centrally through the hopper, *K*, eeparated horizontally, and discharged latterally throagh the lower and upper gates reepectively.

The movement of the maee heing from center to circumference during the eeparating proceee, an accumulation of the heavier metal will appear at the hottom through the glaee at *P*; after eufficient working, and by eetting the gate in the proper position, a continuous etream of the heavier metal will escape therefrom, while a conetant diecharge of the lighter material occurs at the other gate, thue making the entire apparatne automatic in iteaction. The eimplicity of the ooncentrator is one of ite most remarkahle featuree.

The machine Mr. Metcalf hae on exhihition at Denver ie the emalleet eize manufactured, and ie intended for 10 tone per day. The tank of thie machine ie only ahont 17 inobee in diameter, and the ease of operation ie remarkahle. The epeed and capaoity of thia oonoentrator have never heen determined. By trials, with critical epectatore ae jndgee, it hae run at the rate of 20 or 30 tone per day, and then was not up to ite full capacity.

Holding Its Own.—The hue and cry ahout etopping the hydraulic minee hae acted upon real eetate in thie oity contrary to what many predicted a year or eo ago. Inetead of depreciating, property has heen on the increeee in value, and no owner of hueinese etande caree to eell at even the present high pricee. Rents remain at ahout the same that have prevailed for three or four yeare, except in an ocoeeional case where they have heen increaeed. It ie the firm belief of many ehrewd men that with present proepecta in the qnartz mines, property will not go any lower in value for a great many yeare to come, and if there is any radical change it will be for the hetter. There are more paying qnartz minea in operation here now than ever hefore in the hietory of the city, and, beeidee, there are hnndrede of undeveloped quartz minee that will he opened up in the near futnre. The hereafter ie fnll of hright proepecte, and all eee it except the natural-horn "croakere," and for the good of themeelvee and the town they onght to have died years ago.—*Nevada City Transcript.*

A Copper Boom.—The Candeleria *True Fissure*, of laet Saturday, eaye: The ecene at and around the railroad atation at Soda Springe is a very huey one just now. The railroad company hae erected a large and commodioue warehonee and laid eide-tracke and ewitchee to the emelter, and for ite own convenienoe. New honeee are going np ahont the emelter and near the etore of M. Schwartz. There are abont 75 men in the near vioinity, and none of them idle. It ia reported that the emelter ie to he ahut down temporarily in a few daye, to enahle the work at the mine to he got in hetter ehape for the more rapid extraotion of the ore. Thie will he accomplished very eoon, and operations at hoth the mine and furnace will continue nninterrupted for a long time.

CORRESPONDENCE.

We admit, unendorsed, opinions of correspondents.—EDS.

The Slickens Question.

EDITORS PRESS:—Suppose there are two rivers, each draining a large section of the country; John Doe wishes to hold all the mines on one, and Richard Roe on the other. John Doe takes up a ranch below the mines on one of the rivers, and insists that he is the only man who has a right to run tailings there.

Richard Roe takes up a mining claim low down on the other river, builds a debris dam, and contends that no one has a right to run tailings where they will flow in his dam.

Which of the two men would most effectually accomplish his purpose? If you, or some of your correspondents will attempt to answer this question, you will, I think, throw some light on the stone-dam question.

Yours, ANDREW JACKSON.

Wesh, Plumes Co., Cal., Aug. 20, 1882.

Hemp Culture in Yucatan.

A correspondent of the *Textile Record* gives some interesting information concerning the culture of hemp in Yucatan. It is one of the largest and, also, speaking comparatively, one of the poorest of the 27 States of the Mexican republic. It does not export either silver or gold. Its rich coast lands, where a fine quality of sugar-cane is perennial, are scarcely made use of at all. Its grain product is not sufficient for the home supply, and a considerable import trade goes on in wheat and corn. Its population in 1880 was officially estimated at but 302,000, and its landed property was assessed for taxation at $2,763,641. And yet this out-of-the-way fraction of Mexico has built up for itself a spirited trade in henequin, its one important product, that already has caused one railroad to be built; that is causing, at the present time, the construction of several others; and that rapidly is making the country rich instead of poor.

Henequin is propagated from cuttings about 18 inches high, which are set in rows 10 ft. asunder and two or three feet from plant to plant. The period of cultivation is about six years. After this period has passed, the leaves may be cut twice a year for 20 years, each cutting yielding about 15 leaves. Preparation of the fiber for market is simple and rapid. The leaves are cut in the morning; the fleshy part is removed and the fiber cleaned by a wheel which drags or beats them through a narrow opening; the cleaned fiber is dried for two hours in the sun, and is then baled and is ready for shipment.

The essence of the henequin trade is its certain and abundant profit. The fiber costs the planter, by the time that he has it in the bale, about two-thirds of a cent per pound. The freight charge per pound by steamer to New York is three-quarters of a cent. Adding commissions and incidental expenses, the total charge on each pound sold is close upon one and a half cents, and the selling price per pound is from five to seven cents. With profits such as these to be had from hemp, it is not surprising that the cane culture is neglected, and that wheat and corn are imported.

A MOUNTAIN OF MINERAL.—Manuel Fontez has been, for the last two years, prospecting in Salmon River mountains, in the range between Middle and South Fork, where the Sheep-eater Indians were hunted in 1879, and captured late in the fall of that year by Lieut. Farrow's command. Manuel was with Bernard's supply command, and from observations, pronounced it a rich quartz country. Since that season, he has put in all his time, during the season that the mountains are accessible, prospecting for quartz. He found a great deal of rich float, but was not able to strike onto a lead, or at least, onto one that he was fully satisfied with, until a short time ago. The lead that he has struck lies over the mountain west of Loon creek, and is said to be a mountain of galena, carrying a large per cent. of silver. We have seen specimens of the ore sent in here to Mr. John Earley, who is a partner in this find, and it looks as well as the Bullion, Idahoan, or any of the Wood River ores. Mr. Earley left last week to visit the mine.—*Idaho Statesman.*

GONE TO REST.—Valentine L. Orndorff, better known as "Tip," died in San Francisco on Friday last of consumption. Deceased was an old and favorably known man in nearly every mining camp on the Pacific coast, he and his brother Jim being among the Nevada pioneers. About a year ago, he came to Tombstone, accompanying Con. Cutler, thence into Sonora. Thinking his health sufficiently improved, he returned to San Francisco, remaining there until his death. Many an old-timer, whose toilsome journey along life's rugged pathway has been smoothed by the kindly cheer, free heart and open hand of "Tip" Orndorff, will drop a tear to his memory. May he rest in peace.—*Tombstone Republican.*

Concentrating Ore in Utah.

The Salt Lake *Tribune* says: Utah has in the mining districts very large quantities of low-grade ores. Some of the good-paying mines have upon their dumps, and in great deposits in the workings, hundreds and thousands of tons of ore which is so low in lead, silver and gold, and at the same time is of such character that it will not pay for sending to market. Where galena ores are mixed with quartz, and there is an abundant supply of water, the ore can be cheaply concentrated and brought up to such a standard as will give a margin above costs of handling and working. The usual plan with such ore is to run it through jiggers, which get rid of the quartz as waste and save the valuable ore almost free from other substances such as lessen its value. But in many localities there is a difficulty in getting a supply of water to operate such jigs, and the cost of concentrating ores is too great to give any profit to the miner. At the Yosemite mine, Bingham, there are thousands of tons of a low-grade ore, such as is called black pyrites, besides a large quantity of carbonates. As this ore shows about 27% lead, seven or eight ounces of silver and $1 in gold, the balance being pyrites of iron and black quartz gangue, requiring roasting and expensive processes of reduction, it is easily to be seen that it will not pay to ship. But if the valuable part of this ore can be concentrated so as to reduce three or four tons into one, and the cost of this concentration is not too great, there is money in doing it. The specific gravities of quartz being 2.5, pyrites 5, and galena 7.5, it is easy to separate these three articles by using proper machinery and plenty of water. The common plan for doing this is with a jigger, being simply a two-compartment box, in one of which is a plunger to agitate the water, while the other has an outlet for the water through sieves, over which passes the ore to be concentrated. This class of jigger does good work where the ore is galena and quartz, except that it requires much hand labor, and frequent delays while taking out the concentrations. The owners of the Yossmite mine found that such jiggers were not what they should be for handling the pyrites ore of their mine, and they have lately devised and put in operation a jigger which embraces the same principles of all the others, but is so arranged as to work almost constantly without interruption and, at the same time, secure better results. The plunger compartment has a hinged valve for the admission of water and an opening on the other side to let the water flow out when forced by the plunger. Such an arrangement makes simply a pump for the purpose of giving an intermittent flow through the machine, instead of a constant stream of water. As the water is forced out, it passes through the second compartment, thence up through a sieve, over which is fed the ore to be operated upon. This ore reaches the sieve through a hopper and spout. The sieve is placed on a slant, so that the ore passes across it lengthways, during which time it is agitated and washed by the water being forced upward at intervals. The fine ore, called hutchings, falls through the sieve and passes into the bottom of the plunger compartment, while the first-class ore goes out at another place and falls to the bottom of the second compartment or box, and the middlings finds its place in the third box, while the pyrites go out through the tailings pipe. When the boxes get filled with the good ore, a plug is drawn and the water washes the ore down upon a floor, ready to be placed in bins for drying and shipping.

Such a machine as we have attempted to describe is capable of concentrating 10 or 12 tons of crude ore per day, and one man will be able to operate four or five such.

To estimate the value of the operation of concentrating ores, we give the value of each class. Crude ore carrying 27 per cent. lead, 8 ounces silver and $1 in gold, is worthless for shipping. When concentrated, it gives for every three or four tons of crude one ton of good, carrying 75 per cent. lead, 21 ounces silver and $3 in gold. Now this product of a heretofore useless article is worth at present prices $44 when delivered at the smelters in the valley. For its production, the company is at the following expense: For mining and concentrating, $10; transportation, $3.50; sampling and handling, $1, making a total cost of $18.50, which leaves a margin of $29.50 to the owners.

Water for doing this concentrating is obtained from the mine in draining it, the supply being ample to run four machines, 12 hours per day. Each machine will concentrate from 10 to 12 tons of crude ore per day, and each requires less than one-half horse power to operate it.

The question of making the handling of low-grade ores profitable is one that should elicit the attention of mining men more than it heretofore has done.

We have been speaking only of the second-class ore of the Yosemite mine, and our readers must not think that this mine produces only this class. It has paid from the grass roots down, and still has an immense quantity of carbonate and galena ores which are rich in silver, and being of good smelting quality, are eagerly sought for by the smelters.

The total output of the mine up to the present is over $800,000. A depth of 665 ft. has been reached, and developments are going onward. The owners have four claims taking up 2,400 ft. of the vein, and all patented. The concentrating business is only a side issue to the mining operations of the gentlemen owning the property, but it is of such importance, we think, as to attract the attention of persons having low-grade ores, and we know of no mines but have such upon the dumps. Most of the mines in Bingham have similar ores, and if their owners would adopt this system of concentration, it would give that camp an immense boom.

An Old Prospector's Advice.

The Virginia (Nev.) *Chronicle* says: The other night old Blinkus, seeing his son getting ready to go to a ball, proceeded to give him some wholesome advice on woman.

"Tom, my boy," he said, filling up his pipe, "I see you are getting fancy togs on for a ball. Now, I don't object to balls, or any other kind of amusement, but I want to give you a little advice, Tom. Look out for the women you meet there. A man who goes around after women is a great deal like a prospector hunting for a mine. You see a woman at a ball, and she's all frizzled up and rigged out in silk, and powdered and painted wherever her skin shows itself. These surface croppings look pretty well, but if you locate on the strength of 'em you'll get fooled every time. A woman of that kind is just like a salted mine. Don't you take any stock in her. She won't wash. If you want to prospect such a location a little further, slide up and take an assay of her conversation. Ah, my boy! Three per cent. of intelligence, 25 of fashionable etiquette, and the rest frivolity, conceit, ignorance and vanity, mixed up in about equal parts. Drop her right away. Such rock won't pay to mill. If you get a patent for the claim you'd never see a dividend come out of it as long as you lived. The assessments to keep the upper works in repair, and the lower levels from caving in, would land you in the poor-house on a lightning express, and some morning you'd wake up to find your claim relocated by somebody else."

The old man shook the ashes out of his pipe, and continued:

"Sometimes you'll strike a plain girl in a common sort of dress. She won't be good-looking, maybe, and won't have any airs. The surface indications won't show much, but before you've prospected long, you're likely to come to some good indications that will pay to follow up. Rich stringers of conversational quartz, and spurs of intelligence showing up finely the deeper you go. Pretty soon you'll strike a well-defined vein of practical sense. That's the sort of a mine to freeze to. Locate it as soon as possible, and get out your patent papers, and you'll have a regular bonanza to fall back on for the rest of your life. If you think the good claims are all taken up, you are badly fooled. This town's full of 'em. I'm an old prospector, and I've traveled around a great deal. If my time wasn't taken up with my own mine, I know where there are lots of prime locations only waiting for some practical miner to come along and develop. A woman's heart, Tom, is a mighty curious thing. Take it in all it's spurs, angles, ramifications and sinuosities, and it's more of a puzzle and a mystery than the whole Comstock lode. Some fellows try to work it, and by pure luck strike it rich right off, in places where old, experienced miners never supposed there was anything. Gittin' the title to the property ain't the only thing; it's keeping up the proper developments, and seeing that jumpers don't get in and encroach upon your claim. Some of these domestic mines require an awful amount of money for machinery, and some of 'em can be run on about nothing. Whenever you get one of 'em, and find you can't run it to an advantage, the best thing to do is to throw up your job as superintendent, and shut down the works."

DEBRIS DAMS.—It will not be long before the anti-debris people will have an opportunity to try the effect of the injunctions they have threatened against the proposed dams to impound the mining debris on the Yuba, Bear and American rivers, as it is understood that Col. Mendell will be authorized to commence structures of that kind, in conformity to the plans he has heretofore submitted to the War Department, a large proportion of the $250,000 recently appropriated by Congress to "improve and protect" the navigation of the Sacramento, Feather and San Joaquin rivers being used for that purpose. As these works will be undertaken under the auspices of the general Government, the valley people, if they are disposed to try the effect of injunctions, will be compelled to go into the U. S. Courts, where it is not at all likely they will get what they ask for with the same ease they have done in our County Superior Courts. These dams will be constructed by U. S. engineers, and if the Congressional appropriations do not go far enough for the current year, the voluntary contributions of the miners will be given to aid in the building of the dams. It is a hopeful sign that something practical is about being accomplished, as so far about all that has been tried is useless litigation and unsatisfactory declamation.—*Grass Valley Union.*

THE pile of ore at the 20-stamp mill, in Bullionville, known as "Dorsey's monument," the ore having been hauled there by E. B. Dorsey from the Day mine four years ago, when he was in charge of the mine, and the insiders were making their deal, or rather, steal, has been disposed of by Mr. Keeley to the smelting company, and is being hauled to the furnace. The "Dorsey monument" will soon be numbered with the things of the past, and cease to cause Pioches, when they visit Bullionville, to reflect and think how unmercifully they had been bilked by it.

FORESTRY.

Forest Trees of California—No. 12.*

Great White Silver Fir.

(*Abies* [*Picea*] *concolor.*)

Here spiry firs extend their lengthened ranks—
Their violets blossom on the sunny banks.—*Fawkes.*

Among the most stately, elegant and useful fire of the Pacific, with respect to all points of estimation, certainly none excel the white fir of the mountains. The cheerful contrast of light bark of body and limbs, as the eye catches glimpses of them here and there from beneath the soft, starry mantle of living green, recalls virgin linen, white and clean, gleaming aloft from out the exalted spires of "God's first temples"—the primeval groves.

In its young state, this fir is half-spire form, the whirled branches spreading horizontally as do branchlets and final sprays, forming flattened fan-like distributions; the line-like leaves, in two regular rows, one on this side and the other, that of the twigs, as it were, winged; the pinnæ leaves, usually notched at the end, two to two and one-half, and sometimes three inches long, indeed, longer than any other Pacific fir. Rather gray-green, stomata-breathing pores, confined to the middle line, but never absent; in older trees the lower limbs only have notched leaves—this last feature, however, is not specific and peculiar if more common; higher, they are then shorter, broader, rounded above, ends blunt or very short, sharpened; on flowering and fruiting branchlets they even become keeled above and almost quadrangular—stomata cover the entire upper surface, and they are not then so strictly two-rowed.

The white silver fir is a tree from 200 to 300 ft. high, usually four to eight feet in diameter, often with a neat, naked shaft from 50 to 100 ft. or more; top always more pyramidal, even in age, than the great magnificent red fir (*A.* [*Picea*] *magnifica*), probably only another form of *nobilis*, with its colossal, dark cinnamon-red body or bark. It is found in the California Sierras up to 7,000 ft. altitude. The most eminently prosperous belt of the best timber lies between 4,000 and 4,500 ft. of western and northwestern exposures (for present purposes we omit its Rocky mountain, New Mexico and Utah ranges east, or Oregon); at least here the timber is never as good above or below the above-mentioned limits, nor, if lacking in any one of the best-suited conditions—all of which we do not pretend to notice—as average temperature, rainfall, and the like.

Messrs. Toll Brothers, of Dutch Flat, have tried stringers for horse-tramways, three by six inches—half in earth, half in air, the alternate wet and dry test—some of spruce, sugar pine, yellow or heavy pine, redwood and white fir, among these, all tried in the same locality and at the same time, this white silver fir outlasted them all. We examined these, and were it not manifest from many experiments, we should hardly have anticipated it superior to our pitch pine (*P. Ponderosa*). Dr. Parry informs me that a like reputation holds good in that where it is preferred for railroad ties, etc., this fir does not warp like spruce, red fir or Jeffrey's Owen's Valley variety of *P. Ponderosa*, with their marvelous efforts to get away from fences, etc. It makes choice ceilings, shrinks least of all, and takes less paint than any other lumber, as it abounds in (tannic?) acid. Spikes and nails never loosen in the lumber as in other timbers, so that, as entire or half-earth sleepers, outside or inside work, it may be well commended. Another point, it should be remarked, is that the wood is not too hard to work, but soft in the region named, nor is the grain unsightly and coarse, like spruce; besides, it is famous as the stiffest, strongest mountain timber, both for transverse horizontal strain and crushing perpendicular pressure; hence its far-famed esteem in mines for bridges and for strong floors; for hutter barrels, kegs and boxes it is superior, as no taste or odor is communicated to the contents, besides staves for laths and the like; but for laths, Douglas and Merten's spruces are preferred.

Where so much confusion has hitherto existed as to species, one must expect somewhat particular details—perhaps unavoidably prosy—had not the quality, also, been so egregiously decried, like other timbers of the Pacific, a word of commendation might have been sufficient for passing estimation and briefer notes, that only seize some strong points of obvious and ready recognition.

Cones erect or perched upright upon the top branches, three to five inches long, and one and one-half inches or so in diameter, usually obtuse, clothed in a very close, soft, yellowish-green or velvety scum-greenish mantle of exceedingly short villi scales; separately examined—edgewise or side-viewed—the claw is bent at an obtuse angle, so that when broken the base portion of the cone presents a deep, cup-like cavity or fracture; these scales are very broad in proportion, appendages or bracts beneath, short, slightly wedge-like, rounded, blunt or sometimes notched at the end, a sharp point from the center wing of the seed, broad American ax-shaped, or often as broad as long, if not wider, and so on. The most obvious marks are the ashy-gray body below in age, and always the white color of the body and branchlets above; the foliage pale, blooming or light, gray-green tint.

* From "The Forest Trees of California," by A. Kellogg; published by the State Mining Bureau. State Printing Office, Sacramento, 1882.

MECHANICAL PROGRESS.

Speed vs. Wear in Machinery.

Some men believe, or act as if they believe, that no machinery should be run to its real, full capacity, least it should require important repairs after a time. This would be only another way of saying that machinery is made merely for the purpose of being kept all the time in fine order, regardless of any work it may do, whereas, the truer thing is to run a machine for all it is fairly worth, and when it is worn down or worn out, then to repair it or to get a new one. It may be claimed, and with some showing of truth, that a uniform low speed is the most profitable for any machine which is constantly employed, a speed so moderate that little or no repair need be made from month to month. It is more likely to be true, however, in the majority of cases, that the greater profit will lie in the fastest speed that the material under treatment will permit, quite regardless of the repair of the machinery.

The experience of leading railroads is quite to the point in this particular, for, there are cases in which the call for new locomotives has been equal to one in about every four or five days, this requirement being due, not alone to the amount of business, or to its probable early increase, but rather to the gradual wearing out of the older engines. The railroads find that their locomotives pay them best, on the whole, when they are kept continuously at work, day and night, on long runs, even though they may and do wear out fast. Obviously enough, this method of working the locomotives must have led long ago to a diligent and most painstaking study of the elements of locomotive construction, in order that the materials, and ways of putting the parts together, shall be such as to resist this wear and tear as completely as possible. In this last particular, it is interesting to know that the American locomotive may safely challenge comparison with its contemporaries in any part of the world, and if this can truly be said of the locomotive, in the face of the trying work it must do, it ought not to be any less true of other kinds of machinery, whatever may be the service required of them.

How far this suggestion of driving a machine to its utmost, regardless in a certain sense of the repairs it will eventually require, will commend itself to the average mill owner, each man must judge for himself, but the general principle has been so often proved true in all lines of manufacture, that it cannot safely be ignored by anyone. One further suggestion is worth while, as based upon actual experience. Some may claim that a faster speed will entail so much greater labor on the men who looks out for the working of each machine, that he cannot keep all the little ins and outs sharp to their work. In other words, he ought to have more pay or an additional helper of some kind, for it is certainly true, and the statement will bear repeating, that increase of production is the chief element in an increase of profit, and that, too, in the face of any probable increase whatever in the need or cost of repair.

Some mill owners have demonstrated all this to their full satisfaction. Some have tried to, but have failed, but the presumption of success is still in favor of a very large fraction of the mills at the present day.—*P. Barnes in Industrial World.*

CARS PASSING CURVES.—A late Danish invention is intended to prevent the wheels of cars from grinding when passing sharp curves. The axle is divided in the center, the end of one-half having a hollow, and that of the other a corresponding projection, somewhat like a ball-and-socket joint. The desired stiffness is imparted by a tube which surrounds the axle, and extending between the naves of the wheel, bears against gun-metal collars. At the center, between the tubs and the axle, is a gun-metal bearing in which the axle can revolve. The wheels act in such a manner that in running along a straight track, both they and the axle turn together as in an ordinary pair of wheels, but on passing round a curve, the axle slips in its joint, so that the wheel on the inner radius of the curve is retarded, and the outer wheel accelerated in proportion to the sharpness of the curve, with the result of securing greater smoothness of travel in the vehicle and less tear and wear of the tire and the rail.

SHARPENING SAWS.—Many good saws have been spoiled by persons attempting to sharpen them without sufficient knowledge of how to do it. A file should be run along the edge of the teeth until they range evenly, after which the blade should be laid on a smooth, leaden surface, and a moderate rap given on every alternate tooth by means of a square, steel punch and a hammer, turning the blade then on the other side, and repeating the process, taking care to see that the teeth are equally set. This done, the teeth may be sharpened by the file, beginning at the handle end of the saw blade. The file should form, with the saw blade, about two-thirds of a miter angle, and be held at an opposite inclination for every alternate tooth, each tooth being brought to a good, sharp point. In good tools the quality of the steel is alike throughout. It is desirable to observe, in purchasing tools, that they be rather too hard than soft, as the temper will become reduced by wearing.

The Saving of Coal in Blast Furnaces.

It is surprising to note how the consumption of coal in blast furnaces has been economized during the last 20 or 30 years. At one time, the iron masters paid but little attention to the item of expenditure for fuel, and the smelting of iron was attended with great waste of coal, and only of late years has their attention been directed to the best means of diminishing the cost of iron in this particular. This is remarkably illustrated by the extent to which fuel is now economized by English iron manufacturers. According to Mr. Mushet, nearly 10 tons of coal were used in 1796 for the production of one ton of pig iron, and in 1826 it required at least eight tons for the smelting of the same amount. This enormous quantity was reduced to 70 cwt. in 1864, and now the quantity used by the Cleveland iron makers is only 42 cwt. A great deal depends, of course, upon the quality of the ore to be smelted, for the higher its metallic richness, the less fuel is required; as, for instance, the hematites of Cumberland and Lancashire, which possess a very high percentage of iron, in 1866 required only 32 cwt. of coke, which, since then, has been reduced to 24 cwt. per ton, while some other ores cannot be smelted with less than 50 cwt. of coal per ton of pig.

This remarkable economy of fuel is due in great measure to the improvements in the furnaces, which instead of being open as formerly, are now close-topped for the utilization of the gases. A good deal also depends upon the quality of coal used, though in some instances this is not taken into consideration. In South Wales, where there is good smelting coal, and the ore yields an average of about 30 per cent., the consumption of fuel is equal to 42 cwt. per ton of pig, while in Durham and Northumberland, where the ore is not as good, and the coal by no means superior, 18 cwt. per ton is required.

The consumption of fuel at Coalbrookdale, in Shropshire, the oldest iron district in England, is the highest known in the manufacture of iron, it exceeding 50 cwt. per ton, but many of the furnaces are of the old type; while the coal used is not particularly good. In Lincolnshire more attention has been paid to economy, and in the close-topped furnaces the quantity of Durham coke required is 24 cwt. per ton, and sometimes even less than that, but of South Yorkshire coke, 30 cwt. is required.

The north of England has taken the lead in the introduction of all economical appliances, and Mr. Gjers has estimated that in the Cleveland district, the economy of coke, consequent upon the increased heat of the blast, has been equal to 10 cwt. per ton of iron produced, and a like saving has been made by the enlargement of the furnaces. The returns at the English Mining Record office show that last year the total saving of coal in the manufacture of iron in England amounted to 4,607,550 tons.

The economy of fuel in the manufacture of iron has by no means attained its ultimate limit, but will be increased as a greater temperature of the lining and pressure of the blast is secured. These remarkable changes all seem to be going in the direction of lessening the requirement for coal, but the increased consumption due to the development of manufactures and the needs for domestic use in all civilized countries, removes all danger that the saving of fuel made in the manufacture of iron, will in any way interfere with the coal trade.—*Mining Herald.*

A NEW FLOOR COVERING.—A new and desirable papier mache process for covering floors is described as follows: The floor is thoroughly cleaned. The holes and cracks are then filled with paper putty, made by soaking newspapers in a paste made of wheat flour, water and ground alum, as follows: To one pound of flour add three quarts of water and a tablespoonful of ground alum, and mix thoroughly. The floor is then coated with this paste, and then a thickness of manila or hardware paper is put on. If two layers are desired, a second covering of manila paper is put on. This is allowed to dry thoroughly. The manila paper is then covered with paste, and a layer of wall paper of any style or design desired is put on. After allowing this to throughly dry it is covered with two or more coats of sizing, made by dissolving one-half pound of white glue in two quarts of hot water. After allowing this to dry, the surface is given one coat of "hard oil-finish varnish," which comes and is bought already prepared. This is allowed to dry thoroughly, when the floor is ready for use. The process is represented to be durable and cheap, and besides taking the place of matting, carpet, oil-cloths or other like covering, makes the floor air tight, and can be washed or scrubbed.

THE LARGEST WROUGHT IRON COLUMNS.—The wrought iron columns made by the Phœnix Iron Works for the Albany bridge are said to be the largest ever made. Each is composed of eight segments, the iron of which is one and nine-sixteenths inches thick. Each column requires 894 steel rivets, and the weight complete is 18,806 lbs. The square inches of section are 104. The eight columns, therefore, contain 150,448 lbs. of metal and 7,152 rivets.

ACID-PROOF CEMENT.—Make a concentrated solution of silicate of soda, and form a paste with powdered glass. It will be found invaluable in the operations of the laboratory where a luting is required to resist the action of acid fumes.

SCIENTIFIC PROGRESS.

Combustion Without Flame.

Solid carbon can be burned without flame and will evolve an intense heat, but it is not generally known that gases can also be consumed without flame. If a coil of fine platinum wire be put in the wick of a spirit lamp, and the lamp lighted, the platinum wire will become red-hot. If the flame be now blown out, the wire will continue to glow by the combustion of the spirit vapor, much as the wick of a candle glows after the flame is extinguished. Mr. Fletcher, of Warrington, has developed the principle involved with very remarkable results, burning ordinary coal-gas without flame, and producing an enormously high temperature. He gave practical illustrations of the process at the *soiree* of the Society of Chemical Industry, at Owen's College. Taking a ball of iron wire about three pounds in weight, Mr. Fletcher placed it on a slab of fire-clay, and directing a blow-pipe flame on it for a few seconds, he suddenly blew the flame out. The temperature increased so rapidly that in a few seconds the wrought iron fused and ran into drops, and this temperature was steadily maintained. The room was darkened, but the closest examination did not show a trace of flame, although the fact that the gas was burning was proved by repeatedly relighting and extinguishing it. The same experiment was repeated in another form by directing the flameless heat into a small fire-clay chamber, in which a refractory clay crucible, made especially for nickel melting, was partially fused and worked into a ball like soft putty, the sides of the fire-clay chamber being at the same time fused. The heat was so tremendous that the blow-pipe laboratory, which was given up to Mr. Fletcher for the evening, was much too hot to be agreeable, in spite of open windows and ventilators. It is certain that such temperatures as obtained by Mr. Fletcher without flame have never previously been obtained with the fuel used, which was nothing more than an ordinary gas supplied through a quarter-inch pipe, assisted by an air blast. Mr. Fletcher's views on the subject are very simple. "Flame is not a necessity in chemical combinations and does not exist in the combination of say, platinum and tin, which evolves a tremendous heat, nor does it exist, so far as he has been able to detect, in the explosion of gun-cotton, provided the gun-cotton contains nothing but what in itself is sufficient to form a perfect combination. The flameless combustion is simply a succession of almost silent explosions; there is a subdued roar always present, but it is steady and continuous." The increase of temperature corresponding with the reduction of the size of a flame is well known. Mr. Fletcher has only carried it a little farther and reduced the flame to nothing, carrying the known theory to its mathematical conclusion, thereby proving its correctness. We need hardly point out that the process may yet play a very important part in the arts.—*London Engineer.*

FORMATION OF COAL FROM MARINE ALGÆ.—The theory that the immense deposits of coal so widely distributed over the earth, had their origin in immense depositions of marine algæ, in contradistinction the notion that they originated from accumulations of terrestrial plants, is now gradually meeting with acceptance by geologists. Prof. Reinsch has made this subject a special study, and strongly confirms the marine origin of the great coal deposits. The theory that coal has been formed by the depositions of marine algæ, originated with the late Prof. Frederich Mohr, an eminent chemist and geologist, who advanced it in his interesting work entitled the "Geschichte der Erde," which appeared in the year 1866, and in which he supports this view of the origin of coal with many ingenious arguments, inferences and facts, many of which have since been confirmed. The luxuriance of these forms of submarine vegetation in many portions of the oceans surpasses belief. At the present time, the Southern hemisphere appears to be the region in which they grow most luxuriantly, though they are widely distributed everywhere. They are especially abundant near the equatorial regions of the southern oceans.

ALCOHOL FROM ACORNS.—It is said that alcohol, equal to that made from grain, can be produced from acorns. The acorns are freed from the shell and ground finely; then they are mashed with malt and allowed to ferment. Acorns contain about 20% of starch and 18% of gluten. They would be a valuable article for human food if it were not for the tannic acid (about three per cent.) which they contain. Vast quantities which go to waste every year, where hogs are not fed in the woods, might be gathered by boys and converted into alcohol for use in the arts, thus freeing an equivalent amount of grain for use as food. Or some young student of practical chemistry might make a good thing for himself and for the world by devising an economical process of separating the starch, gluten and tannic acid, the last for technical uses and the others for food.

THE air of London during a fog is found to contain a large excess of carbonic acid over the normal proportion.

MORE ABOUT LUNAR CLOUDS.—Mr. J. G. Jackson, of Hockessin, in a letter to the Wilmington, Del., *News*, under date of July 18, 1882, says: Last evening (July 17th) I again saw the "feathery mist of cloud on the moon," lying just over the westerly edge of the "Mare Clansum," against the "Promontorium Agarum" the same as I first observed it on May 19th, and which was noted in several papers. Being fully confirmed in the impression then had of the extent and importance of the phenomenon, as indicative of the present physical condition of the moon, the fact of her atmosphere, etc., I marvel much that it has not been observed and noted elsewhere ere this. My notion is that this cloud forms by volcanic action at the place above stated, during the lunar night of every month, and can only be seen on one particular evening, about 48 hours after conjunction (new moon), just as the rays of the lunar morning sun, rising over the mountains of the promontory named, become sufficient to illuminate the mist, but not yet warm enough to dispel or evaporate it. The fact that the moon is then but a slender crescent, generally low in the haze of our horizon, seen but an hour or so before setting, must be the only reason why it has not been oftener witnessed. I missed it on account of cloudiness after new moon in June, and only caught it through the rifts of cloud last evening.

VIBRATION OF THE GROUND PRODUCED BY RAILWAY TRAINS.—Professor H. M. Paul has communicated to the Seismological Society of Japan some notes on the effect of railway trains in transmitting vibrations through the ground. A box, holding about 20 lbs. of mercury thickened by amalgamation with tin, was placed upon a heavy plank screwed to the top of a post sunk 4½ ft. into the ground. Images reflected in the surface of the mercury were observed by a telescope, as in meridian observations. An express train passing at a distance of one-third of a mile, set the surface of the mercury in confused vibration for two or three minutes. Professor Paul has also found that a one-horse vehicle passing along a graveled road, 400 or 500 ft. distant, caused a temporary agitation of the mercury whenever the wheels struck a small stone.

PROPAGATION OF HEAT IN CRYSTALLINE MINERALS AND SCHISTOSE ROCKS.—M. Jannettaz has found, in a series of experiments, that the propagation of heat in crystalline minerals depends upon the cleavage, taking place less readily in the direction of a normal to the plain of cleavage than in a direction parallel to it. This distinction, however, does not apply to pseudo-cleavages, or in other words, to the lamellar structure resembling cleavage, observed in some minerals; for example, sahlite. In experiments with various rocks, M. Jannettaz has shown that true stratification is without influence on the propagation of heat, but that in schistose rocks (when the schistosity is due to lateral pressure), it takes place more readily in a direction parallel than in one perpendicular to the plane of schistosity.

STARCH AND SUGAR FROM SEAWEED.—Mr. Alexander, of St. Ives, is said to have succeeded, after numerous experiments, in extracting from seaweed a composition like that of starch and sugar, which, it is said, is well adapted for the economical manufacture of certain articles of commerce, such as imitation leather and transparent substances. The seaweed, previously washed in pure water or in water impregnated with a little lime or potash, is dried and then pulverized according to its variety and introduced into a conical boiler. A bath of hot water or jet of steam is allowed to act upon it and extract a soluble substance, and the residue, on cooling, assumes a gelatinous consistency.

ASTRONOMICAL EXPECTATIONS.—When the sun, the earth and Mars come again into line with the earth in the center, at the next opposition of Mars, on the 31st of January, 1884, some of the great telescopes that are now being built will be in successful operation. With these increased facilities for a nearer view, we may hope to learn something more tangible concerning the curious movements that are taking place on a planet whose real features are more nearly within the power of the human eye to grasp than those of any member of the solar family.

ACTINIUM.—A year or more since, a gate post that had been painted with so-called zinc-whits, was noticed to appear black all day, gray in the twilight and white during the night. Mr. T. L. Phipson was led to investigate this singular chameleon property of the paint, and after much research has shown the cause to exist in a new metal, which has been named actinium, on account of its peculiar actinic effects. It is found in zinc ores, and resembles zinc.

STEEL NAILS.—A machine has just been put in operation in Pittsburgh which cuts nails from steel wire. Mr. Taylor, an English mechanic, is the inventor, and the funds for the construction of the machine were furnished by Pittsburgh men. It is claimed for the invention that it can cut steel nails at the rate of 15,000 to 40,000 per hour, and the nails produced are much superior in strength to the ordinary kind.

PROF. MARIA MITCHELL, the astronomer of Vassar, has reached her 63d year. She has almost perfect health, and is as vigorous as ever.

The California Iron and Steel Co.'s Works Destroyed.

On Sunday, last, the building, machinery and furnace of the California Iron and Steel Co., located at the village of Hotaling, Placer county, about four miles from Clipper Gap station, were totally destroyed by fire. The fire originated from the furnace, and was followed by an explosion of gas. A mass of about 100 tons of ore was suspended in the furnace six feet above the fire. This enormous mass suddenly dropped, forcing the doors of the furnace open, and sending an immense volume of gas into the building, which immediately exploded. Flames followed the explosion, and soon all the buildings in the vicinity were in ruins. Near the foundry were two large coal hunkers, in which 225,000 bushels of charcoal were stored. This was all burned. No one, as far as known, was hurt. About half a mile from the foundry were about 20 houses of the employes. These escaped damage. About 100 men were thrown out of employment by this accident. It is greatly to be regretted, as the company was only now in good, full working order, and making money. Their product is of very fine quality. These works were erected by this company, and have been in operation since May, 1881. Last January the company re-incorporated under the name of the California Iron and Steel Co., with the following officers and Directors: President, Egbert Judson; Vice-President, George W. Gihbs; Secretary, John Finn; Treasurer, Peter Sather; Attorney and Counsellor, A. N. Drown; Superintendent, Samuel Cowles; General Manager, Charles S. Chamberlain; Directors, B. B. Redding, A. P. Hotaling and Irving M. Scott. In the prospectus issued this spring, the capital of the company is stated to be about $400,000. The loss by the fire is estimated at $150,000, on which there is no insurance. The works will be rebuilt. It is stated that the new works will be at Sacramento, Benicia or Oakland, but on this point, nothing definite is publicly known.

Compressed Asphalt Pavement.

In the Mechanics' pavilion is shown a form of compressed asphalt block, such as is in use in some of the cities in the East, Australia and England. The blocks are made by a process of crushing and beating calcarious material (which material, when heated, has great affinity for asphaltum), and, while heated, bringing such in contact with heated asphaltum (of a proper temperature and properly tempered), in proper proportions of each. This work is done by machinery especially adapted to the purpose.

This mixture is then pressed into rectangular blocks of convenient size, in a mold, under a pressure of more than 50 tons (that being the limit of compactibility of the material), then treated in a water bath until cold and ready for use. The material is then homogeneous. Although this material, and in this form, has been known for years to possess merit, yet the problem to solve (which has now been accomplished) has been to perfect machinery that would form this material into block form so as to comply with all of the requirements of a street pavement, reliably, rapidly and economically. The process and machinery have been patented by Mr. J. Kinner. It can be easily and quickly laid, as easily removed and relaid, without injury, when repairs or alterations to grounds or buildings are necessary, and the work can be done at any season of the year. Mr. L. L. Robinson, Halleck building, in this city, will give any details about the pavement on application.

Mining Share Market.

The market is attracting considerable attention just now, and the fluctuations being frequent, makes it interesting to the dealers. Our tables show what these fluctuations have been.

Assessments falling delinquent in September amount to $774,509, levied by 27 mining companies. Of this money, Nevada mines call for $628,300; California, $104,250; Dakota, $15,000; Arizona, $19,959; Utah, $3,000, and Idaho, $4,000. This makes the assessment list for the first nine months of the year foot up $5,930,974, against $7,184,560 during the same time in 1881, and $10,286,300 in 1880.

Kullman & Co., who suspended the other day, have settled with their creditors, and resumed business.

At the annual meeting of Northern Belle, on Monday, the following trustees were elected: G. T. Lawton (President), W. E. Norwood, J. M. Shotwell, S. Reinhart and H. H. Allen. William Willis was re-elected Secretary; W. V. Price, Superintendent, and the Nevada Bank, of San Francisco, Treasurer. During the year, according to the Superintendent's report, "the mine has yielded 22,980 tons of ore, and the mill has crushed 22,850 tons. The face value of the hullion is $928,170, showing an average of $40.62 per ton. We have employed at the mine an average force of 145 men, of which nnmher 80 have been engaged in the extraction of ore, the rest on general work, prospecting and improvements. Our present force is 135 men, and the daily yield of ore is about 64 tons." There were nine dividends of $25,000 and three of $12,500 each. The discount on the hullion, including freight and mint charges, were $135,548, equal to about 14⅔%. The net cash, Septemuer 1, 1882, was $112,253. A dividend of $25,000 is to be taken from that amount on the 15th.

Guide to Silk Culture.

A Useful Manual for Beginners.

The "Silk Growers' Manual," by W. B. Ewer, contains, in a condensed and clear form, instructions for the aericulturist. We advise our lady friends to buy a copy.—*Fresno Expositor.*

Furnishes in a brief and explicit manner all necessary information in the matter of silk culture.—*San Jose Mercury.*

An interesting compilation to encourage home silk culture in California. Everybody should read it.—*Anderson Enterprise.*

Anyone interested in silk culture will find this full of valuable information.—*San Joaquin Valley Review.*

Furnishes all necessary information to begin tho silk nusiuess.—*Marysville Appeal.*

It is a very interesting little work, and well worth the price.—*Mendocino Beacon.*

It is worthy the perusal of all interested in silk culture.—*Concord Sun.*

Copies of "The California Silk Growers' Manual" mailed from this office for 25 cents each.

How to Stop this Paper.—It is not a difficult task to stop this paper. Notify the publishers by letter. If le comes beyond the time desired you can depend upon it we do not know that the subscriber wants it stopped. So be sure and send us notice by *letter.*

Mining Summary.

The following is mostly condensed from journals published in the interior, in proximity to the mines mentioned.

CALIFORNIA.

AMADOR.

Jackson.—*Ledger*, Sept. 7: The donkey engine from the Moore mine has been removed and erected on the Jackson claim. This will enable prospecting to be carried on to as great a depth as will thoroughly test the value of the property. A pair of ore concentrators are being fitted in the Moore mill, which will ere long be started on ore from the Jackson mine. The rock carries a large quantity of sulphurets, which, if saved, will, it is thought, make the rock pay well.....James Morgans is doing some prospecting on the claim at Murphy's ridge.

CALAVERAS.

From Murphys.—Cor. *Mountain Echo:* Buildings are being erected and improvements made that far surpass the building boom of last fall; and, in addition to those now in course of construction, the Oro Plata company put on a force of men the beginning of the past week on their new mill. These works, with the necessary outbuildings, boarding house, etc., will be quite extensive, using in their construction about 100,000 ft of lumber. The mines belonging to the company never looked better. Men are at work in the different levels and stopes, extracting ore and pushing developments in different parts of the mine. The company is well satisfied with the richness and extent of the ore body, and these extensive works are being erected to place the property on a dividend-paying basis. A recent crushing of 11 tons of ore from the O. K. mine—property belonging to Sublett & Dodge—paid $20 per ton. They have a shaft 60 ft deep on the vein, varying in width from 6 inches to 1 ft, the prospects improving as they gain depth. They have 3 fine specimen cbutes in the level they are running for stoping, and some very rich ore is being taken out. Fair progress is made, as the ground is nearly all soft picking. McMartin & Co. made a run of 14 tons of quartz from their mine on San Antonio creek in Moss & Stone's mill last week, and the handsome sum of $600 was realized from it, over $40 per ton. They are developing a fine property. From Colliersville the news is cheering indeed. Mr. Halleck has, to a marked degree, succeeded with his new method of reducing the rebellious ore from the Collier mine. The machinery for a roaster has arrived to town for this mine, and will soon be placed in position. Mr. Collier's untiring energy, perseverance and unbounded confidence in his mine is about to meet the well-merited reward he richly deserves. In Douglass Flat but one mine is working, owing to the scarcity of water. This mine—the Old Judge gravel mine—looks splendid, promising many future dividends. The shaft has been sunk to the depth of 170 ft, disclosing a large body of gravel as rich as any yet taken out. Should the company now trying to get possession of certain mining property in Vallecito be successful—and there is no doubt that they will—the tunnel that will be run to tap Vallecito Flat, will beyond a doubt, be extended to Douglass Flat. In the event of such a consummation of the wishes of everyone, the Old Judge will be a mine of incalculable wealth, and Douglass Flat one of the best mining camps in the State.

FRESNO.

Gertruda.—Cor. Mariposa *Herald*, Sept. 7: This place, at present, is rather dull. The Enterprise mill shutting down about two weeks ago on account of the water giving out, and to give Mr. Cobbs, our genial and energetic mill man, a chance to make some necessary improvements in the machinery of the mill, which he is doing in a very satisfactory manner. The closing of the mill has caused the dismissal of several of the miners. But a large force is still kept on extracting ore, and, soon as the tide salses, the camp will be in bloom again. The Enterprise tenus are kept busily engaged hauling timber from the mountains for the mine. Mr Wm. Walsh, the superintendent, has gone to San Francisco on a visit to his family. Some enterprising men are engaged in erecting a 4-stamp steam-crushing quartz mill on Coarse Gold gulch, somethiug this section is sadly in need of.

The Parker mine—owned by Parker, Marsh & Travers, of Merced—situated in Gruh gulch, has been idle for some time, awaiting the arrival of their engine for the 8-stamp quartz mill. The engine will arrive some time this week, when operations will at once be commenced.

EL DORADO.

Rich.—Georgetown *Gazette*, Sept. 7: John C. Rich, of the Hog's Back gravel mine, is in town. It is gratifying to know that the brightest hopes of the perseverjug owners are now soon to be realized, very rich gravel, and plenty of it, having been struck by the tunnel which the company has been driving for so long a time. The mine is being put in condition for washing the gravel. The stock is nearly all owned by parties in this vicinity.

LOS ANGELES.

The Kelsey Mine.—Los Angeles *Times*, Sept. 9: A gentleman, who knows whereof he speaks, gave the *Times* the following information on the subject of the Kelsey mine: The Kelsey mine is in the San Gabriel valley, 25 miles from Los Angeles, and is the property of Messrs. Kelsey & Sharp. It was bonded from May to November, by Messrs. Dunnan, Tuttle & Filmore, for $12,000, they to spend $300 per month on the claim. They struck ore at 42 ft in the tunnel. Lower down they struck one foot of ore, black sulphuret of silver, also carrying native silver and ruby. Mr. C. S. Hammer has made three trips to the mine in the last 10 days, and he telegraphed to Mr. D. C. Nichols to come down. After an examination Mr. Nichols offered the owners of the mine $10,000 in cash, or, in case of refusal, to bond it for $100,000 for 60 days, and to expend $1,000 per month in its development. Mr. Hammer is going to the Belmont district, taking in Eagle Mountain district, lying 40 miles southwest of the railroad and 100 miles south of Colton, in San Bernardino county. He will be back in three weeks, and will then take another look at the Kelsey.

MARIPOSA.

Rich Rock.—Mariposa *Gazette*, Sept. 7: Some of our people who visited the Juniper mine during the first of the week, received from the hands of Mr. Stephen Arthur, the gentlemanly and courteous superintendent of the mine, several specimens of rich rock, to be laid upon the table of the *Gazette* office for inspection. Gold is most glaringly impregnated all through the rock, and, if the Juniper can produce an average of 5 tons per day for a year of such rock, its owners can well afford to turn it over to the county, and enable it to build a road across to Coulterville, and aundry other improvements needed.

MONO.

Bodie Con.—*Free Press*, Sept. 12: During the week ending the 9th inst., 264 carloads of ore were crushed, of which 51 cars were extracted from the fifth incline level, and 233 carloads from the sixth level and workings below it to the 780 level. The amount hauled to the mill was 164.145 tons, and 118.016 tons were crushed. The average value of the pulp was $53.43 per ton; that of the tailings was $9.06 per ton. The week's shipment amounts to $8,157.20. During the week work in the east crosscut at the 800 level was resumed, and 9 ft were added to its length, now 216 ft.

Standard Con.—During the week ending September 10th there was extracted and shipped to the mills 1,388 tons of ore; crude bullion received 2,940 ozs.; amount shipped to the company, $25,526.54. The east crosscut, 1200 level, is in 285 ft; progress since last report, 17 ft. The rock in this crosscut continues very hard. The stopes show no change. The total shipments in August amounted to $77,622.87.

Oro.—The vein during the past week has widened from 6 inches to about 3 ft of good ore, and there are indications that the vein will increase in width as work progresses. Some good milling ore is being extracted daily.

RED CLOUD CON.—The shaft is now 803 ft in depth. The pumps are making about 7 strokes per minute. Are now cutting out for the foundation timbers of the pumps at the 792 station.

NEVADA.

BANNER MINE NUMBER TWO.—*Grass Valley Union*, Sept. 7: The North Banner, No. 2, is looking very well. A crushing was recently made from the ledge and yielded $30 per ton. This mine used to be known as the Forest claim, and is located on Banner hill, near the old Banner mine which was so rich a few years ago, and is probably rich yet. The old Banner's profits went to help build up tha city of San Jose.

RICH ORE.—A. H. Scott, who is mining on Banner hill, ran into a pocket of decomposed quartz recently, and it proved to be very rich. The quartz was easily washed, and a half dozen or so pans of it yielded $2.7 in coarse gold.

SAN BERNARDINO

CALICO.—*Los Angeles Mirror*, Sept. 9: Mr. W. C. Worsham returned from Calico Wednesday afternoon, and will spend a few weeks in the city. Mr. Worsham brings a very good report of matters and things at that camp. All traces of sickness have disappeared, and the weather is pleasant. Travel toward the new bonanza is again setting in, and it is likely that for some months to come there will be a tremendous tide setting that way. Work is now being resumed on many of the claims which were abandoned on account of the great heat and sickness, and some wonderful developments are being made. At the Snowbird mine, a few days since, a body of ore was uncovered, which appears to be almost solid silver, and is so free from foreign substances that it may be addressed with a knife.

SIERRA.

QUARTZ MILL BURNED.—*Mountain Messenger*, Sept. 4: On Wednesday night, of this week, the Good Hope quartz mill was burned to the ground. The fire was discovered about 11 o'clock, and, when first seen, the roof was in flames. The persons who were first on the ground cut Jack Hughes' flume, and, with water so obtained, saved the county bridge across the North Fork. The mill had been running that day, but when the workmen left there was no fire left in the mill, so far as can be learned, and it is supposed to have been the work of an incendiary. The mill was insured for about $5,000, a part at least of which was in the Oakland Insurance Co. The turbine wheel was not injured, neither was the stand pipe leading to the wheel. The cams, cam-shafts, counter shaft and mortar appear not to be injured. The stems are badly twisted, however. The probable expense of rebuilding will, at a guess, not exceed $4,000. We underatand that the mill has been doing well lately, and why anyone should wish to destroy it is a mystery. The amount owing to the laborers in the mill and mine is only $150. A watchman was employed to look after the mill, but he was sleeping in a blacksmith shop a short distance away, to watch some amalgam, and when he discovered the fire it had gained such headway that it was beyond controll by any means at hand.

PUSHING WORK.—*Sierra Tribune*, Sept. 7: Supt. Smith, of the Lafayette hill gravel claim was in town Sunday. He says that the tunnel of that mine is in 300 ft. Two shifts are working steadily and making good headway. The tunnel will reach the center of the ridge in about 100 ft further. A flow of about 3 inches of water is running from the face of the tunnel, which is a very good indication that the channel will soon be tapped. A dam has been completed on Kanaka creek, which will furnish water for washing purposes. Operations on the double-track tramway will not be commenced until gravel is struck.

THE RAINBOW QUARTZ MINE.—Five stamps of the Rainbow Co.'s new 10-stamp mill have been started up. A limited supply of water in Kanaka creek has deterred the starting up of the other stamps. However, arrangements are being made to overcome this trouble by procuring water from other sources. The ore now being crushed is of high grade, and no doubt some large returns will be the result. The mine is being opened out in a systematic shape, and shows the supervision of experienced men.

NEVADA.

BRISTOL DISTRICT.

DAY COMPANY.—Ploche *Record*, Sept. 7: At the Day mine the lower workings continue favorable, and the bottom of the winze continues in ore. The Chisholm mine still yields its regular supply of flux and is looking well. The furnace is now running as nicely as possible, turning out the richest base bullion in the State. The copper matte is to be shipped to Hamburg, Germany, for reduction. Owing to bad air in the Day mine, most of the men have been knocked off until ventilation is made.

PAY-DAY MINE.—After straightening the shaft and putting in timbers and false guides, Supt. Hook resumed sinking on Tuesday. Everything is running smoothly, and good work is being done. In the bottom of the shaft floral spar and sbale bas been encountered, with some little quartz. The ground is changeable and breaks well. Depth of shaft, 162 ft.

COLUMBUS DISTRICT.

NORTHERN BELLE.—Candelaria *True Fissure*, Sept. 7: During the week 0 ft have been added to the length of the main drift on the fifth-shaft level. The upper part of this drift seems to be passing out of the hard slate into a softer formation, something like that found in crosscut No. 1. This crosscut has been advanced 10 ft in the formation last reported. The crosscut from the main drift of the third shaft level has been extended 8 ft; its total length is now 38 ft, the face being in extremely hard rock. As the air connection are now all completed, work has been resumed in the upraise from the first shaft level, from which le being extracted some ore of moderate grade. This upraise shows vein material 10 ft wide, all of which gives low assays. The outlook below the ninth level is very satisfactory, as during the early part of the week sinking was commenced on the ore, and is now down 66 ft, the winze being entirely in ore, which pitches to the north and west, and gives every indication of continuing still farther downward. The total bullion shipments on August account was $98,334.76. One shipment on September account was made on the 7th inst. of $10,542.80.

COLUMBUS CON.—Good progress is being made in the drift from shaft No. 1, the face being in ground admitting of rapid work. During the week this drift has cut a 2-ft vein of ore, which would appear to be the top of a chimney of unknown size. It extends 1 ft above the floor of the drift, and pitches downward. Assays from this ore body extend into the hundreds, and is a verification of the report made last week.

MOUNT DIABLO.—The west intermediate, below the second level, and nearly above winze No. 1, is now 74 ft long, and shows several inches of $80 quartz. The raise from the second level north of shaft is showing 6 inches of $100 ore. The east intermediate below the first level is being extended to connect with this raise, and is showing some good ore in the face.

ESMERALDA DISTRICT.

NOTES.—Esmeralda *Herald*, Sept. 7: The Cortez still *statu quo*.....The Silver Lining holds the same ore in quality and quantity.....The Lewis Con. is working the usual force, with good results.....Rumor says that 60 men will be at work, inside of 20 days, in one of Aurora's prominent mines. Speed that day.....We, in error, stated in our last, that the Silver Lining mine belonged to ex-Governor Blasdel; it should have been mentioned as belonging to the Humboldt Hill M. & M. Co.... The Humboldt West mine is improving with every foot sunk in the shaft. A regular bonanza is there. The quality of rock now on the dump, if in some localities, would create a furore and a boom.....The New Esmeralda people are jubilant, and upon merit. The mine is exceeding all expectations. The character of ore now at Kimball & Booker's store proves that time, coin, muscle and experience will make somebody rich.

EUREKA DISTRICT.

STARTED UP.—*Sentinel*, Sept. 12: The mammoth works at the Eureka Con. new shaft started up yesterday. The machinery worked to a charm without a hitch or jar. By this morning the water will have been all pumped out of the shaft, which is 908 ft deep, when work will begin immediately to sink the shaft deeper. This will open up a new area for prospecting in Eureka district, from which the most important results are to be looked for.

INYO

MONTEZUMA.—Inyo *Independent*, Sept. 7: Supt. A. H. Griswold has purchased this mine, and is now engaged in the work of getting a smelter in operation. He has bought a water-jacket, engine, and a nearly complete outfit at Darwin, which teams from Big Pine will start after during the coming week. Mr. Griswold is determined upon making a success, and, to start with, has the rare, good judgment to employ local men—men who can help him out. We refer to Mr. S. D. Woodhull, as master smelter, and Wm. Hodge, as mechanic and engineer. With their aid and his own good, practical management, if he don't make the big mine—or deposit—pay, it would seem that it were hardly worth while to attempt any mining enterprise anywhere.

THE PALMA.—During his late work on the Palma, the old "Gold Hill" gold mine of Cerro Gordo, Supt. M. A. Wheeler has continued work on the openings—tunnels—respectively 220 and 240 ft in, with winzes 15 and 10 ft in depth. Mr. Wheeler has some 16 men at work, extracting ore for reduction at the mill. According to the report of Tom Treglone, a well-known miner who lately came from there, the developments are showing up well. Mr. Wheeler intends starting the mill within a week or so and keep it constantly running.

PANAMINT.—Supt. Phebyls doing good work in the Inyo Con. company's mines. He has about 300 tons of ore at the mill, 100 tons at the mines, and will extract enough more to make the September run fully 500 tons. The ore is all of high grade, and will average at least $100 per ton. Supt. Phebe says the outlook for large bullion outputs there was never so favorable as at the present time. The mill machinery referred to in these columns last week has arrived and is being placed in position. The mill is probably in operation at this date.

MODOCK.—F. Fitzgerald has 18 men at work on the Bismarck mine, and 5 taking out ore from the Modock property. He calculates that the next run of the surface will be the "boss."

THE INDIANA.—Mr. C. J. Johnson has returned from San Francisco, where he went with a lot of ore from the Indiana mine. The certificates show that 30 sacks of it assayed at the rate of $626.59 in silver per ton; lead, 37.70. Another lot of 80 sacks assayed $373.41 per ton, with 21.60 lead. There is at the mine some 10 tons more, which will assay $100 per ton, with much more in sight. It will come in handy when somebody puts up a smelter at some central point on the river.

BULLION.—George Thorpe brought down from the Pioneer mill, last Thursday, 45 lbs. of silver bullion, worth $15 per pound. This was the result of working about 100 tons of the old Kearsarge tailings. The bullion is a surprise as to its fineness, but does not amount to as much per ton of tailings as expected. The best part of the old tailings reservoire is yet to be worked.

LEWIS DISTRICT.

BETTY O'NEAL.—*Lewis Herald*, Sept. 6: A large force of miners have been put to work during the last week running a drift south on the lower level, and have struck a large body of good ore. They are stoping out a large quantity of rich ore, and will keep the Highland mill running constantly.

MORNING STAR.—They are sinking in the Mayo incline in 3½ ft good ore, and have started a crosscut to the hanging wall from the north drift. The wagon road will be completed in a few days.

STAR DISTRICT.

ORE.—*Silver State*, Sept. 8: William Woolcock was up from Star district yesterday. He said he had struck a small vein of ore in the Orizzly mine at that place, which assays from $500 to $1 000 per ton.

WASHINGTON DISTRICT.

SATISFACTORY.—Grantsville *Bonanza*, Sept. 6: Uncle Billy Koch and George W. Mitchell went over to Washington district, on Sunday, to look after some mining interests they have there. There promises to be quite a stir in that section soon. Some Virginia parties have bonded a mining property belonging to W. B. Sheehan and others, and have commenced operations on it. The mine owned by A. J. Franklin, and others, continues to improve as work progresses, and the ore, which is shipped to Salt Lake for reduction, gives satisfactory returns.

WILLOW CREEK DISTRICT.

THE BIGGEST FIND YET.—H. H. McColley arrived in town from Willow Creek, and though ordinarily a cool man, he was somewhat excited. He says D. McPhetres, of Spring City, has been prospecting near Willow Creek lately, and a few days ago found a ledge between Willow creek and Flat creek, which, so far as prospected, excels in size and richness anything in the mining line ever found in this part of the State. The ledge has been uncovered at right angles with its course, and it is known to be 91 ft wide. Holes have been sunk at intervals for 800 ft along its course, and the character of the ore is the same, so far as prospected. The ore carries free gold and considerable silver. Pieces of the ore pounded in a mortar and panned out show it to be rich in gold, and the indications are that Willow Creek will soon rank among the best mining camps in Nevada.

ARIZONA.

CASTLE CREEK.—Prescott *Courier*, Sept. 7: Mr. James Campbell arrived here recently from Castle Creek, Black Canyon and other mining districts south of Prescott, from all of which he brings encouraging news. The copper properties in the Castle Creek country are looking well. Owners are sinking on their claims; the veins are of good size and rich enough to pay well.

BLACK CANYON.—While in Black Canyon district, Mr. Campbell purchased one-half of a 1,500 ft extension on the Holmes lode, which, he assures us, is the best gold mine he has seen in Arizona. The vein, in a shaft on the ground purchased by him, is exactly 6 ft thick; the gold is pretty evenly distributed through the rock, which has never sampled less than $100 to the ton. Richer results have, of course, been obtained, but this is absolutely the lowest sample. The Holmes portion of the lode is, in places, much richer than this. Mr. Holmes asks $150,000 for his interest. The kind of mills needed for this great bonanza are at least 40-stamp ones. There are places in Mr. Holmes' claim where he can get ore 30 ft thick, and so full of gold that it is hard to find a barren piece.

NOTES.—Mr. Campbell has let a contract for taking out ore, and hopes to have a mill up and running in a few months.....H. Wickenburg is preparing to work rock from his leonoclast mine in arastras. He purchased his Holmes ground from James G. Trotter, of Tiptop..... Mr. Craigue, of the Dosoris mine, returned home recently from Lynx creek, where Major Dake's smelter is doing good work. Mr. Craigue is sure that the smelter is a success..... B. T. Riggs, who is managing matters at the Tiger, says that the mine is now free of water and debris. His workmen have driven a tunnel 100 ft south, towards the Collier claim, which, we believe, is now owned by the Tiger company.....The business of taking out ore of the Black Warrior and shipping the same to New Jersey for treatment, is all the time going on.....The Peek people are making good headway in the matter of drying the mine; they are also opening the Occidental.....The Tuscumbia people are as close-mouthed as ever. Their mill is running, and the supposition is that the ore is paying.....Turkey Creek district is not producing much ready bullion, but large piles of ore are there awaiting milling, etc.

TOMBSTONE.—*Epitaph*, Sept. 7: The week has been quite devoid of sensations in the mining world, the new strikes developing nothing noteworthy as far as prosecuted. The camp in general is doing better than ever before, and the output is steadily increasing. One of the pioneers of the camp, a careful and conservative business man, informed us yesterday that never before was so much actual mining being done as at present. According to our informant there are from 12 to 20 more mines being worked at present than at any period in the history of the camp. It might be said, with equal truth and justice, that, so far as developed, the mines are in excellent condition. It is safe to say that not less than 50 mines and prospects are being worked now within a radius of 2½ miles from this office. There are reports of new strikes daily, and the quality of the mineral in the producing mines grows better as depth is attained. Another fine body of ore was exposed in the Contention during the week, while both the Grand Central and Contention reflore in a new surface discovery near the boundary lines of both mines. The western portion of the district is coming out strong. The Randolph, Winfield and Blue Jacket are astonishing even their owners. A town is being laid out in the vicinity of the Winfield, and a store and saloon established. The Little Devil, located about half way between the Blue Jacket and the Stonewall, is a marvel, large bodies of ore assaying over a thousand dollars, being almost daily opened up. Under such circumstances, it is no wonder that mining men are buoyant, and the owners of prospects are encouraged to go to work and develop.

WEST HUMBUG.—*Gazette*, Sept. 7: Henry Alexander returned from Castle Creek and the West Humbug district, Saturday evening, and informs us that renewed activity is noticed in mining enterprises since the weather has grown cooler. On the Mayflower lead a 4-ft body of copper ore, of a very high grade, was encountered, and down to the present depth, 50 odd ft, it has continued to improve. Up at Farley's camp, on Humbug, the miners are elated over the prospects of the immediate erection of a 10-stamp mill. The mill has already been shipped from the East, and will be taken in some time during the next 6 or 7 weeks. James Campbell, of the Castle Creek Copper mining company, has gone East. He recently purchased from Mr. Trotter, assayer for the Tiptop company, a half interest in the first extension on the Holmes mine, Squaw creek, and will put a large force to work immediately upon his return.

COLORADO.

CITY GROVE.—Georgetown *Courier*, Sept. 7: The adit on the City Grove mine is in 180 ft, and shows a continuous ore vein the last 70 ft, ranging from 8 inches to 1 ft in thickness. The first-class ore has milled $200 and 214 ounces of silver per ton, and one lot unassorted milled 125 ounces.

RELIANCE.—A good strike was made last week in the Reliance lode, an extension of the Matilda Fletcher, on Democrat. Work was commenced on it about 2 weeks ago at sinking a shaft from the surface, and a vein of decomposed ore, about 6 inches thick, has been uncovered that assays from 400 to 600 ounces of silver per ton.

JACK FROST.—J. B. Johnson is busy developing his Jack Frost lode, East Argentine. He has an adit in 75 ft, in which a 3-inch vein of quartz has lately made its appearance, and looks favorable for ore. Mr. Johnson will soon resume work on the Globe lode, which is situated a short distance below the Boyd, and shows high-grade ore from grass-roots.

OOLD DIRT.—The Oold Dirt lode, on Silver mountain, North Empire, has been leased to Mr. John F. Carter, proprietor of the new Bancroft-Carter mill at that place, who will work it for the purpose of supplying the mill with ore. The lode carries a vein of ore from 10 to 15 inches wide, the average assay value of which is between $30 and $40 per ton, gold. The size and value of the ore vein in this mine are a fair average of the lodes in that district, and if Mr. Carter can work this mine at a profit with his process, there will be no longer any question in regard to the future of Empire.

THE MATILDA FLETCHER.—Young & Arnold, lessees, had a lot of ore, weighing about 9½ tons, milled on the 28th ult., which was taken out during the month preceding by 6 men, that netted $1,936.40. It was divided into 3 lots, which returned respectively 340, 321 and 106 ounces of silver per ton. On last Saturday Warren M. Fletcher & Co. had a lot milled that came from the stope over the 2d level, which returned 527 and 274 ounces, according to class. Cbew & Hopkins are driving the 3d level ahead, which shows a small vein of ore that, dressed in one class, returned 350 ounces per ton.

THE LEBANON TUNNEL.—A force of between 30 and 40 men are employed in the Lebanon tunnel, on No. 5 and No. 10 lodes, nearly all of whom are in excellent pay. The whole of No. 5, and a part of No. 10, is leased to Mr. F. R. Carpenter, who has over one-half of the force in the mine employed. He is at present excavating an engine chamber on No. 5, immediately east of the tunnel, which will be 30 ft long, 10 ft wide and 20 ft high, and will be completed in about a week, when the new 10-horse power hoister, now at the works of the Union Manufacturing Company, will be set up, and work will be commenced at sinking the shaft and opening up the ground below the tunnel level, which, up to this time, has remained almost wholly unexplored, notwithstanding the fact that a great many thousand dollars have been profitably extracted from the ground directly above. The chamber is being excavated by Williams & Co., under contract. At the east end of the Charlie level, on this lode, Nelson & Co. are stoping on a fine vein that yields about $20 per day to the man. On the level below, Dick Davis is working single-handed, and is taking out between $300 and $100 a month.

IDAHO.

EAST FORK OF THE SALMON.—Vienna *Reporter*, Sept. 7: The Red Warrior, owned by Dickson, Ruark & Co., is looking well. The tunnel is now in about 50 ft, having run the entire length of the tunnel along the ledge, taking out a very fine lot of ore, which will assay as high as 300 ounces of silver per ton. The ledge matter is about 12 ft wide, carrying more or less mineral all through, but about 4 ft is of very high grade, and will some day well reward the boys for their very active and industrious moves they are, and have been, taking towards developing their mines.....The Washington is also being developed by a small force, and to good advantage, there being a cut run which, in one place, exposed a body of galena ore 12 ft wide, all fair paying; and in another place bave shown up a body 7 ft in width.....In a westerly direction from the Quaker City, and over the divide, is situated the Idaboan, which looks well. It is being worked by a small force of men, who are extracting ore of a very high grade. The tunnel is now in 80 ft, and have in the face 4 ft of extra fine galena ore.....The Jefferson is being worked upon, and is showing up well. A very fine body of ore is being exposed to view.....The Red Deer is also looking well. It is being worked with a small force, and extracting some of the precious metal. .....The Grand Prize, owned by the Laurium Silver mining company, of New York, is now under an attachment, and no work is being done. At the discovery stake we noticed a 2-ft vein carrying galena and carbonates, assaying from $200 to $500 per ton. Over $40,000 have been invested in getting and making improvements on this property.....In a southeasterly direction, and about one-half mile from the Grand Prize, is the Golden Sheaf, owned by George Steward and others. Work is being pushed ahead by 2 men. They are now tunneling in a northerly direction in the bottom of a shaft that is down 40 ft to tap the main ledge, and expect to tap it every day. Considerable high-grade ore has been taken out, and is now piled on the dump. Average assay of ore, $100 to $300 per ton.....In a westerly direction from the Grand Prize, and on the opposite mountain, is a claim owned by Mr. Rochon, who is now working the lode to a good advantage.

PAYETTE.—Ferdinand Allers and another man lately discovered 6 mines on the head of the Payette river, about on the line between this and Boise counties, and it is not known positively which county they are in. They are situated 15 miles north of Silver district. The names of the locations are Summit, Julia, Mammoth, Romeo, King of the Forest and Benanne. The last two named are on the east side of the mountain and below the others. They are situated on a ridge about 3 miles from the river, the veins running down the divide. The ore looks well, and the croppings gave assays running over $50 per ton. They think a good, and probably extensive, mining district will be openedup there. To reach the place from here, one should go down the Salmon to Valley creek, thence up Valley creek to Lake creek, up Lake creek to the divide between Lake and the Payette. There is to be found the Summit mine.

BIG SMOKY.—A few days ago we paid a visit to the Lucky Jim and Mary Graham mines, on the divide between Pink creek and Big Smoky. We found Dave Pink at the Lucky Jim, where he, with one man, was engaged at running a tunnel. The ore is of a very high grade, and there is considerable in sight. .. Some work has been done on the Mary Graham lately. It is 4 or 5 ft wide, and tha ore is of a very high grade. It is near the Lucky Jim, and runs parallel with it. This will, when developed, be a valuable piece of property.....The Nevada, owned by Robert Orr and William Gilliland, is being developed by the Gilliland Bros. At the depth of 50 ft they have a body of galena ore 6 ft wide that assays way up. This is considered the best galena mine on Big Smoky, and will, when it passes into the hands of some company with means to carry on the work with greater energy, keep a large smelter running the year round.

GALENA.—The mines in and around the vicinity of Galena are being worked vigorously by the many owners. The Eclipse, owned by a New York company, and situated about 3 miles east, and near the head of Cherry creek, has been started up with a good force of men, and are now extracting ore. Work will be carried on all winter. .....The Conway Castle has also been started up, and are now at work in good earnest. This piece of property belongs to a New York company. They will go to taking out ore and shipping immediately.

BEAVER GULCH.—Ore is being hauled from the Beaver and Columbia mines to the company's mill. It is of a very high grade, and will do its share toward making the richness of the country known abroad. The mill commenced crushing last Saturday, and will turn out bullion till snow flies, at least.. ...The Silver King, which was struck last week by Mr. Kelly and others, is turning out to be one of the best bonanzas of the upper country. The ore is ruby and antimonial silver, assaying from $1,000 to $5,000 per ton. ..Reports from the mines in Beaver gulch and on Lake creek are that they are all improving, and will demand the erection of more mills next year.

MONTANA.

THE SHONBAR.—*Inter-Mountain*, Sept. 4: But few mines in the Summit Valley district have made as rich showings as the Shonbar. The operations have been confined principally to work in the east and west levels at a depth of 80 ft, and very rich ore taken from them. The shaft attained a depth of 140 ft, when the flow of water prevented further sinking until additional machinery was procured. Levels were run at the bottom of the shaft, and a rich and important strike has been made in the west level. We were shown, this morning, a piece of ore that will assay between 2,000 and 2,500 ounces, while the entire body will give a return of over $00 ounces.

MINING SALE.—On Monday of this week the sale of the St. Lawrence mine to R. C. Chambers, of Salt Lake, was consummated. The mine has been bonded by Mr. Chambers for some months, and it has been demonstrated to be more valuable, by far, than its owners or the party bonding it anticipated. The price paid was $2,500, and a duplicate of the Anaconda hoist has been ordered to work the mine. The property is situated just east of the famous Anaconda mine, the property of Haggin & Tevis, and it is said this mine was bought for this firm. The sale of a mine for this sum is destined to make still more prominent the mines of the Summit Valley district.

BANNER.—Helena *Independent*, Sept. 7: Work has progressed far enough in the Banner mine to insure more than pay for the outlay, and to some extent verify the predictions so often made as to the character of this property. A chute of ore measuring 30 ft along the vein, and about 3 ft in thickness, was encountered in the tunnel, and one-half consists of a coarse-grained galena product, carrying a high percentage of lead, and the other half a dryer ore, very fine-grained, intermixed with streaks of galena, with ruby silver showing in occasional specimens. This property lies in a position which gives promise of great ultimate value. A large amount of ore has been thrown in sight in this mine by means of tunnels, levels and shafts opened in prospecting it, and the galena product is found to be worth about 80 ounces to the ton.

NEW MEXICO.

NOTES.—*News*, 7: The Socorro mill will treat Torrence ore.....The Homestake mine, at White Oaks, produces 50 tons of ore per day, getting $1,000 in cash.....Grafton, Chloride and all the camps of the Black Range will be represented at the Albuquerque fair.....The Silver Bar mining company, of St. Louis, Mo., has begun the development of the "Extension No. 2 North," of the Cooney mine, with flattering prospects of success. This property fulfills the expectations of the owners... The Vice President of the San Pedro mining company is expected to arrive from Chicago this week. He is coming out to complete arrangements with Messrs. Gardner & Gillies, the lessees of the copper ore, who expect to commence work soon after his arrival. ....The copper ores of the Oscuras are extremely rich, and would make mining in that section exceedingly profitable if water could be found in sufficient quantities. The ore has been tested in the East, where it was pronounced high grade and easily treated. It is believed that artesian wells will furnish the desired water, in which case the Oscuras have a bright future. ..A rush of miners, capitalists, railroad men and others to the Organs, Silver Hill and White Oaks is reported.

OREGON.

PROSPECTING.—Jacksonville *Times*, Sept. 7: D. A. Neal, an old Shasta miner, has gone to Josephine county on a prospecting tour. He speaks highly of the mineral resources of this section..... Jake Miller, of Josephine county, has been sent on a prospecting tour for copper in the mountains between Waldo and Crescent City by parties from abroad..... Shepherd Bros., who did some mining near Major Barron's place last winter, succeeded so well that they will continue operations on a larger scale next season.....A great deal of prospecting is now being done throughout southern Oregon, and we shall soon see the hills full of prospectors. The railroad is bringing them forward.....J. W. Hays, who is interested with J. M. and R. A. Cook in a promising quartz mine recently discovered in the Gold Hill district, says work will be commenced on it at once.... N. O. Mitchell and George Ross, who are prospecting this county for quartz, are now cleaning out the old Blackwell shaft. We learn that they will put up a quartz mill somewhere in that vicinity. ..The Roseburg *Plaindealer* says it is reported that a very fine lode of nickel ore has been discovered on Myrtle creek, near Mt. McLaughlin, which promises to prove very valuable. It is said that parties from San Francisco are becoming interested in the mine and will have it thoroughly tested and worked.

UTAH.

A REVIEW.—Salt Lake *Tribune*, Sept. 9: The week shows continued progress in the different mines. The Ontario keeps along in its rich-yielding way, the ore reserves steadily increasing, while the production of bullion is limited only by the milling capacity. The tunnel to tap the workings on the 600 level makes fair progress, as does also the East Cbance shaft. With the building of the new mill in the spring, the bullion output can easily be doubled, at but small added cost, and then the stock ought to double in price.....The Horn Silver does better and better. Friday we noted the receipt of upwards of $10,000 in bullion from this operation, and there is every reason to expect it to be one of the main metal-producing properties in the world.....The Pinyon Hill disputes progress in their settlement without any hitch, as far as developed. It takes a good deal of time, however, to gather up the tangled thread of so great and widely scattered interests.

Local Fairs.

At this season of the year, when fairs are being held in various parts of the State, an opportunity is offered for people who are desirous of posting themselves on local products to do so. Those who think of settling here, and all on the lookout for homes, will find this a good time to go about the country. By visiting these fairs, they will be enabled to converse with representative residents and see what the neighborhood produces, and can make up their minds as to what particular branch they think will be most lucrative.

In San Francisco, our annual fair is that of the Mechanics' Institute, now in progress. Here the exhibits are mainly of a local nature, as far as manufactured products are concerned, and a glance at the displays will give a pretty fair idea of the variety and scope of our manufactures. But it will not give a perfect idea. The largest manufactories we have among us are our foundries, and they are not represented at all. Most of the products of these institutions are made to order, and are wanted as soon as made, so that the manufacturers are unable to exhibit them, because they must be delivered on completion.

But the other manufactories, such as must keep stocks on hand, are enabled to show us what they can do. Rope and cordage, wire-work, canned goods, agricultural implements, hardware, brass goods, machine tools, barrels, belting, lead works, paints and oils, furniture, carriages, carpets, mattresses, frames, glass, pianos, mantels, stoves, and all the hundred and one other things may be seen which indicate our manufacturing prosperity. And it is a subject of congratulation that not only is this list extended each year, but the older branches are widening and increasing.

San Francisco, as the metropolis of the coast, has, of course, a larger show than other places, but all the other fairs are worth visiting by those who wish to see the progress of the State exemplified.

Tributing.

Discussion of its Merits and Demerits.

The Eureka (Nev.) *Sentinel* has the following in regard to tribute mining. The question of whether the tributing system is of benefit to the camp or not is becoming discussed in Eureka, and all the points pro and con brought forward. The question of benefit, as far as the mines outside of Ruby Hill are concerned, is one of the greatest importance to every miner and merchant in this and adjoining districts. Mine owners claim that in some instances tributers, instead of seuding their waste to the surface, fill up all the available openings in the mine, leaving it in such a condition as to make prospecting for ore exceedingly expensive, even beyond the ordinary risks. The miners claim that while certain tributers make money fast, the majority make less than $1 a day. Our business men say that of all the tributers employed on Ruby Hill less than one-fourth obtain sufficient from their "pitches" to pay their monthly expenses. The owners of a large number of mining claims on Adams hill, Prospect mountain, Secret canyon, Pinto and other districts, declare that they have gone as far as their means would permit them in prospecting, and it is only just and proper that they should receive the encouragement that their energy and enterprise deserve. There is a faint suspicion that those who are howling against the tributing system on general principles, are non-producers and have not even a ten-cent piece invested in a single legitimate mining enterprise in this district. Now, is it not fair to qualify, and before condemning the tribute system, ask if it has not its certain advantages? If a man is possessed of sufficient courage and enterprise to develop a mine from a mere surface prospect, and is forced to quit for want of further means to carry on his explorations (mines that pay from the grass roots are very scarce), does he not deserve encouragement or assistance at the hands of miners, mechanics and business men of the community? The tribute system may save many a mining enterprise from absolute failure and be of the greatest possible benefit to a community. The practiced miner and the mine owner may each be greatly benefited by the tribute system if it is carried out on true business principles.

It is seldom that a miner will take a tribute "pitch" on chances altogether against him. In the Ruby Hill mines a miner will take a tribute "pitch" where there is a small seam of ore that may be followed, even if it does not assay five dollars per ton; or he will take his chances in apparently barren limerock, if it is in the vicinity of a worked-out chamber or well-known ore body, but will not take altogether desperate chances. In the mines of Prospect mountain, or any locality distant from Ruby Hill, the average Ruby Hill miner does not care to take chances on a lease (or tribute "pitch," which literally is the same thing) claiming that the veins are too small to pay them for taking chances. The records, however, show that by leasing in these mines, good wages may be obtained, and in some cases snug little fortunes may be made. For instance, a few years ago, Mike Lyons and four or five others, cleared $36,000 in five months on a lease of the El Dorado mine on Prospect mountain. Subsequently, Owen Riley and one Cadden cleared $40,000 during the space of seven months from a lease of the same mine. Almost similar results have been obtained from leasing the Industry mine on Prospect mountain. The Grant mine was at one time leased to four or five men, who cleared over $30,000 in six months. Other mines have given equally good results. Among mines that have from time to time yielded good wages (some of them far better than ordinary day's pay) to men working under lease, are the Macon City, Lone Pine and many others in distant districts. These, however, are only a small number of the many mines situated within a few miles of Ruby Hill that have been worked profitably under the lease of tributing system, and there is no telling what good results may be obtained from many others under the same plan.

A Prospector's Notes on Nevada.

A correspondent of the Virginia *Enterprise* writes from Camp Middlesex, Gillis Mountain district, Esmeralda county, Nev., an interesting letter, from which we extract the following information:

Having a desire to go outside of the great and famous Comstock metal waves for a few weeks' inspection of the surrounding mineral prospects of other localities, I left the "Old Homestead" in Gold Hill—my resident home for the past 20 years.

Some three months ago, I bade my friends good-bye, and left by way of the Carson & Colorado railroad, my first point of inspection being that mining district bearing the great, noble and much-revered name, Garfield. At this place I saw a limited number of small claims, producing ore of a superior quality; also, a very large number of non-producing claims, this latter class being generally a predominating feature in all mining localities. Having thoroughly looked over Garfield district, and finding the entire surface located, or at least "literally monumented," I visited other places, and finally crossed the valley from the little, but lively, town of Luning into the Gillis Mountain range. Here I found a small mining community, where an outside prospector was not looked upon as a trespasser. There were a few promising claims being developed, one or two producing fine ore for shipment.

After having taken a little rest, I took my prospect pick in hand and started out to explore the surrounding hills; made five premising locations, and, with my own labor, have two of the same thoroughly developed, with ore for shipment, and the others well under development—sufficiently so to warrant me in saying I have claims bearing rich ore. Since living here, I have, in hard rock formations, excavated nearly 80 ft. of large incline shafts and tunnels, have surveyed and made upwards of three miles of road, the same being now opened and traveled, besides doing much other outside labor. I could have accomplished more, but the excessive heated season has made me feel somewhat languid and lazy.

The ledges here are small, but, with energetic action and true economy, there would be left a margin of profit above expenses. Numbered with the mines here now producing and showing ore, are the Burnley, South Mountain, Hidden Treasure, Yellow Jacket, Tremont, Opportune, Middlesex and Creditor.

The mining prospectors of this locality

Need More Encouragement.

They need either a special reduction of prices on ore transportation, or small reduction works in their immediate vicinity—works that they entertain confidence in, works that will reduce ores at an honest percentage and at reasonable prices; for, under the present rates of transportation, none but the very richest ledges can be successfully worked, and the larger class of ores from these ledges is for the present thrown aside, as $40 and $60 ores will not pay expense of shipment and milling.

The railroad company has done nobly, but it is yet in its power to do more. They have, at a great cost, built one of the finest, best-ballasted and stocked roads in the State. The rolling stock is first-class, especially the coaches, which are little beauties. This road passes through a desert, barren country, a country predominating in mineral lands. Mining will be the leading industry, and should be the most fostered and encouraged—encouragement with capital to lead. Indolence in this portion of Nevada should be unknown, for along the line of this "little narrow-gauge road" is a vast area of mineralized ranges, unprospected, undeveloped. It is a good field for the enterprising, energetic and practical mining prospector.

Miners are not Prone to Growling

Without a cause. In this vicinity they are not only growling, but are beginning to grate and gnash their teeth. They have mines with small veins of rich ore, and under the present state of things are compelled to sample this ore down to an actual "grade of bullion," and dispose of the same to "ore shavers" at a low percentage of its actual value. Most of these ores are shipped to San Francisco, and strangers intrusted to "count the miner's uncounted coin," and make returns at pleasure.

No mining camp or community can be prosperous under such a state of things. One by one these little mines are dropping off from the field of action, having suspended work. That old and oft-quoted injunction, "Live and let live," should be generally in force, and I am informed that the mine owners and others operating in their respective districts, bordering on the line of the Carson & Colorado railroad will soon approach and must respectfully and earnestly suggest and ask the directors of the Carson & Colorado road to give this matter their careful and earliest consideration, and to make a reduction of at least one-half from

The Present Prices on Ore

Transportation, to give the required relief, to set the example, "and other connecting links of road to follow suit. By making this special reduction, the increase on first and second-class ore shipments, other freight and travel would be more than ten-fold, and these arid valleys and mining hills would be dotted with renewed life and industries, vigorous and lasting, and the now humble citizen made to realize a reward from industry—the fruit of his proudest ambition.

The Mining Prospector's Life

In the mountain wilds is a grand school for mental culture, but not strictly of a refined nature, for the harder he toils, enduring hardships and privations, "greater is the volume of thought." When the prospector retires for rest at night, wrapped beneath blankets lying upon the ground, he is inviting as a bed-fellow to scorpions, lizzards, and rattlesnakes, and bruin, panther, lion or lynx might chance to come round in quest of refreshments from the body of the sleeper, the hobtail catamount for a scratch at his ear, and the sneaking coyote, a snap at his nose, all of which are unpleasantries to contemplate, but of the least concern to the prospector battling with want, hunger and thirst—his worst privations. "Give honor to whom honor belongeth." To earth's hidden wealth the mining prospector is the path-blazer—railroads and all after adjuncts are but interlopers.

The Value of Ore.

The Necessity of Repeated Assays.

An item from the Bonanza *Enterprise*, Colorado, illustrates the necessity of frequent assays during the development of a prospect, or even in the working of a mine. It says, "that for a few days past the ore taken from the winze in the Empress Josephine mine showed large quantities of a bluish crystallized mineral, in appearance resembling low-grade galena. The ore assorter had put it aside, in doubt whether it should be thrown over the dump or put with the third-class ore. Its value was put at about $40 per ton. At a suggestion of one of the owners, it was decided to have it assayed. An inferior sample was selected, knowing that that would show the value of the pile. It proved a rich telluride, having a value of 1,748 ozs. in silver and 5 ozs. in gold, making an aggregate of over $2,000 per ton."

In paying mines this uncertainty is well understood; therefore, samples are taken from every carload or bucket taken from the mine, and many assays are made daily, that the management may detect the slightest change in the grade and character of their ore. If so much attention is paid to this matter in mines of known value, how much more the necessity of pursuing a like course in a mere prospect. Every change—even the slightest—in the appearance of the ore should cause the management to have it tested. Mill men well know the difficulty in dealing with prospectors who bring small lots of ore to them for reduction. In nine cases out of ten, the estimate placed upon the ore is from 30% to 50% more than the ore will sample, as it comes from the batteries, and the result is great disappointment, and too often accusations of dishonesty on the part of the mill men. It is often the case that paying ore is indiscriminately mixed with the waste and is thrown over the dump. We heard of a case of this kind only a few days ago, where rich ore, that on the outer surface was so discolored that it showed no evidence of value, was being thrown over the dump as waste. By accident, a piece was broken, when an examination showed that it was literally covered with horn silver. Since then the dump has been overhauled and the rich ore assorted out and saved.

There is no excuse for anyone in charge of a mine being deceived in the value of his ore, thereby misleading the mine owners and the public. The underlying cause of this state of things are three, viz., ignorance, penuriousness or design. Of the three, the worst is that of design, for that is done to promote stock sales, and some one invariably gets cinched. The State Line and South Pacific are cases in point, and more might be cited were it necessary. Too much stress cannot be laid on the necessity of frequent assays, in all stages of the development of mines.

Signs of Winter.—The Sacramento *Bee* says: The past week was one of almost unprecedented (for September) heat in the interior of California, in some localities the mercury going up high among the nineties. There was little or no air stirring, and the atmosphere was thick and heavy, and therefore very oppressive. It was probably the last really hot spell of the season, as from this date forward the weather gradually cools with the rapid shortening of the days and lengthening of cool nights. Already the mountain springs have begun to increase their flow of water at night, and within a week or two the same effect will be noticeable in the valleys. But a couple of months now remain in which people may make the usual necessary preparations for the rainy season, and this is a matter that wise persons never neglect. Fuel and other household commodities are higher in winter than summer, and good sense should prompt persons of moderate means to lay in certain supplies while they are low in price.

Stand by the Ship.

The gold-producing industry, in all its branches, has been thoroughly unsettled throughout the State by the persistent and malevolent antagonism, for some time past, displayed by the so-called grangers. Not only are the laboring classes in the mountains being brought to the verge of want, but capital has taken wings from here, and will not think of coming back till the troubles are settled in some reasonable and just manner, as they are certain to be in the end. As matters stand now, it is utterly impossible to induce men of means to invest in quartz as well as gravel enterprises. When approached by the holders of property desirous of enlisting their aid in the work of development, they invariably reply that they cannot venture to make an expenditure in this direction till it has been definitely determined whether the valleys are entitled to receive the mountain streams in their original purity. Any man of average perceptive powers can understand readily that the same ruling which prevents a hydraulic mine from dumping 1,000 tons of debris into a waterway, can restrain two quartz mines from dumping 500 tons each into the same channel. None of the anti-mining organs have as yet been able to combat this reasoning in a sensible manner, and none of them ever can. They simply "assure" us that the hydraulic way of working is the only one that will ever be interfered with, yet they cannot but know full well, that, should they carry the point they are now striving for, all miners will forever hereafter be at the mercy of any unconscionable blackmailer or blockhead of a fanatic who may care to put obstacles in the way of their working.

The miners have but one course to pursue, and that is to insist upon their right to mine as they have mined for more than a quarter of a century past. They must not abate one tittle from this stand; for if they accede an inch today, they will find to-morrow that they have been robbed of an ell. Whatever they may conclude to do in the way of dam building or the like, they must go about in the spirit of men who seek to relieve distressed neighbors by a charitable act, but not in the way of compromise. The miners are on top, and they must not let go to "spit on their hands." It need not follow that they set themselves up against the law. They know how to work on and still display due respect for judicial institutions and declarations. As they value their future, as they love their families and cherish their firesides, let them stand to their posts like true Californians.—*Nevada Transcript.*

"Keep Still About it."

How stereotyped has become the above phrase, but perhaps not as much so in other communities as in mining camps, and yet it should not be so in localities where mining is the chief industry. But how can it be otherwise? In every camp we have no doubt but what claim-jumpers and black-mailers have their eagle eyes on the alert, watching for an opportunity to pounce down upon some honest prospector's claim, and wrench from him his hard-earned property, even while he holds legal possession and is engaged in the work of developing his claim. This has been done in numbers of mining camps, and no opportunity, even at this late day, is permitted to pass when there is a possible show to swindle a man out of a valuable property. These parasites to the mining industry will loaf around a camp, and watch the toiling miner until he strikes a "pay streak," and then swoop down upon him in an unguarded moment and swindle him out of his property. Is it any wonder that the prospector, when he finds rich rock, invariably cautions his friends to "keep still about it?" Who can blame them for keeping their property quiet until they get a title to it? When a mining claim is known to be relocatable, the owner failing to do the required amount of assessment work as prescribed by law, then "jumping" is justifiable, but not otherwise, either in the face of the law, or estimation of the better-thinking portion of the community. The veritable "keep still about it until I get a patent," prevents the real wealth of a mining district from becoming known. No prospector cares to have his property eaten up by lawsuits; and, as "an ounce of prevention is worth a pound of cure," he conceals his ore and puts a lock and key on his claim, and "mum" is the word until his title is secured. The number of blackmailing schemes that have been in progress for the last few years in the West has deadened mining interests to an alarming extent. When a prospector wishes to sell a claim, he is first asked if he has a title to it, and if he has not, the would-be purchaser turns on his heel with the sneering remark that he does not care to buy into a lawsuit. If he has kept up his assessment work from the time he came into possession of it, he must "keep still about it" until he gets it secured by a Government title. This is a handsome reward for honest labor.—*Bodie Free Press.*

Friendship does not seek pleasure for itself. It does not shun pain or inconvenience. When friends cherished and long held come to grief, it does not seek some dark way by which it may avoid a dividend of sorrow or suffering, and if need be, shame. True friendship is eager to give—to give all; for in the soul's commerce be who gives all keeps all.

The Engineer.

A New Form of Bridge Support.—A novel bridge support has been proposed by Mr. J. F. Smith, of Leicester, England. Bridges, according to his views, shall consist of iron or steel cylinders of any reasonable diameter, made up of plates riveted to rolled-iron or steel ribs, the strength being sufficient to carry any weight required. The lower half of the cylinder or inverted portion of the arch supports the upper half, and has a continuous bearing on the bed of the river along its entire length, the larger the cylinders the more stable the bridge. These cylinders may be riveted up in a dry dock, a portion of the ends covered with movable plates fleated in position and sunk. Some trouble would naturally be caused by irregularities of the river bed, and in such cases suitable preparatory operations would have to be performed. For small water-courses under turnpike and other roads, Mr. Smith says these bridges may be riveted up on the spot, rolled in, covered over, and the bridge is made without any piling, diverting water-course, building foundations and arches or, other trouble and expense usual in the old style of building bridges. Where railroads are to be formed over frequently flooded or boggy land, a number of these cylinders laid side by side will, it is claimed, save railway companies the enormous cost of foundations.

Wear of Rails in Tunnels.—We have, on a former occasion, given a brief account of the rapid destruction of rails in tunnels due to the action of sand used to insure the requisite friction between the driving wheels of the engine and the rails. It will be interesting in this connection to notice the remarks made by M. Poisot before the Societe de l'Industrie Minorale, France, upon the working of locomotives in the Mazenay mines, the great difficulty in the way of their satisfactory working arising from the wheels slipping on the rails, which were always greasy, owing to the smoke and moisture in the galleries. In some parts only half speed could be attained, and in others the wheels slipped continually, notwithstanding that the rails were well sprinkled with fine dried sand. On one occasion the joint of a blow-off cock having broken, a jet of steam escaped and was driven on to the surface of the rails. It was found that during the two days that the engine worked before the fault was remedied, no slipping took place. In consequence of this the blow-off pipes on the different locomotives were so arranged as to discharge directly upon the rails, and highly satisfactory results were obtained in this manner. M. Poisot thinks that a method of obviating the excessive wear of rails in tunnels has thus been accidentally discovered.

Spreading of rails under high temperature is a source of danger, of the magnitude of which travelers know little. When the ends of the rails are too close, as they are very apt to be when laid by the usual rule-of-thumb way, in cold weather, they are certain to press against each other and bulge out the track into a sort of double-wave line in summer. Spikes will not cure the difficulty. Indeed, the less strain placed upon spikes, the better for everybody. Here is the remedy for spreading which one now forever silent was about to put into practical shape and patent, but which may be here given free: No track for a railroad should be laid without a constant consultation of the thermometer, and the application of gauges properly regulated for temperature. That is the general idea, the force of which will at once be seen by every railroad engineer. Inventors may find in this hint something valuable. A reliance on spikes against spreading might be shown to be nonsense by a little boy who had received his first lesson on "expansion" of bodies. The absence of spikes, though, may show that the rails had spread, and that the inspection was negligent.—*New York Times.*

Ancient Bridge Building.—The marked feature of ancient bridge building was the thickness of the piers. The famous old bridge at Verona had a pier 39 ft. thick, though only 11 ft. high. In old London bridge the piers were so enormously thick that the available waterway at low water was less than one-fourth of the width of river spanned by the bridge. The London *Builder* thinks that the modern tendency is to make the piers too light. Of late years, no country in Europe has seen more remarkable bridge work than Italy. Signor Mosca's bridge over the Dora, at Turin, is a masterpiece of construction.

An Electrical Apparatus is said to have been constructed by a priest of Ravenna, which can be set in operation by simply pressing a button, end by which the doors of a large building can be instantaneously opened. The apparatus was tried during the last week of April at the Alighiri theatre in Ravenna, with the most satisfactory result. All the nine doors opened simultaneously, as if through some spiritual agency. The inventor hopes to improve his apparatus, so that, should a fire break out on the stage of a theatre, the rise of temperature would itself set the machinery in motion.

The Union Pacific has now about 4,000 miles of railway. It expects to complete 500 miles during the present year.

Useful Information.

New Artificial Wood.—A German inventor has recently patented a new method for obtaining objects of irregular forms from an artificial, woody mass, which consists of cellulose, starch, meal and sawdust. He makes this material as follows: Ordinary commercial cellulose, reduced to pulp in water, is placed over a fine sieve, to deprive it of the water, after which three parts' weight of starch, two parts of meal (either wheat or corn) are added, and the whole thoroughly mixed. This mixture is boiled for one hour in a water bath, which converts the mass into a kind of glue, which is then mixed with an equal quantity of sawdust. This mass is rolled into plates and left to dry in a hot room. When dry it is ready for use. These sheets are pressed into any desired form by the use of iron or steel molds, heated to about 120 C., and under a pressure of about 700 kilos per square centimeter. Under that degree of heat the mass becomes viscid, and fills every part of the mold. The pressed object is taken out of the mold, and, after cooling, resembles wood, hard and elastic, becoming bone hard after a time. It can be treated like wood, worked with a chisel, sawed or filed, and be colored, polished or glued. It can also be veneered. In order to prevent objects made of this woody mass from expanding or drawing, the mass may be rendered more plastic by adding pipe-clay in the manufacture. Coloring matter may also be added to the mass. A very good, but of course inferior article, may be made by increasing the percentage of sawdust.

Double Time-keeping.—An invention has just been patented by which the time of two distinct places, at whatever distance situated, can be simultaneously marked on the face of a watch or other timepiece without interfering with the fixed time which it is desired to keep, or necessitating the moving of the hands of the piece. This invention consists in two supplemental movable rims, working independently of the fixed dial and of each other. The inner rim is divided into hour sections, the outer one into minutes. Two tiny wheels, projecting slightly from the metal bezel which holds the crystal in position, enable the wearer to bring the hour and minute at which he wishes to set these movable dials exactly opposite the hour or fraction of hour and minute, respectively, then and there indicated by the hands of the fixed dial. By this simple device, two different times are kept at the option of the wearer. These supplemental dials may also be used for the recording of engagements, and for a variety of other purposes.

To Measure Heights.—The hypsometer is the name of a useful little instrument for measuring heights of walls, timber, trees and spouting, and therefore valuable to surveyors, builders and artisans. The plan is to take a triangle, composed of three slats, similar to the carpenter's angle, and on each end of the longer side place a small sight vane; suspend from the lower side a metal ball to keep this side horizontal, and construct a handle, with a circle at its upper end, in which the triangle can rest and move, and by which it will slide into the proper position by the weight of the ball. Take the instrument by the handle and move backward until the two sights are brought into line with the top of the building or other object. The hight will be found by adding the distance of the operator from the building to the hight of the eye above the ground.

To Fasten Knives or Forks into Handles.—A material for fastening knives or forks into their handles when they have become loosened by use, is a much-needed article. The best cement for this purpose consists of one pound of colophony (purchasable at the druggist's), and 8 ounces of sulphur, which are to be melted together, and either kept in bars or reduced to powder. One part of the powder is to be mixed with half a part of iron filings, fine sand, or brick dust, and the cavity of the handle is then to be filled with this mixture. The stem of the knife or fork is then to be heated and inserted into the cavity; and when cold it will be found fixed in its place with great tenacity.

Deadening Sounds.—The following plan for deadening floors is reported to have been made the subject of a recent patent. It is exceedingly simple, and not materially unlike plans that have been before proposed in this journal. A three by six inch plank is directed to be inserted between each joist, two inches from the bottom of the joists, and projecting four inches beneath them. The ceiling boards are nailed to these intermediate planks, and the space between is filled with sawdust to within one inch of the joists. By this mode of construction, the sound is said to be so effectually deadened, that the most vigorous hammering from above cannot be heard in the story beneath.

Leather Waste.—The clippings of the sole leather in New England shoe factories were formerly regarded as worthless, and the smell of their burning was a peculiarity of such towns as Lynn and Salem. These scraps are now stamped into buttons for clothes, and fancy tackheads for upholstery, and the long-familiar odor is missed.

A good cement for mending glass may be made by dissolving fine glue in strong acetic acid to form a thin paste.

The accumulation of coal dust in the air of mines is said to be effectively prevented by sprinkling considerable quantities of common salt through the workings. The dust, which is usually raised in clouds and floats in the air, is thus kept down the same as damp sand. Salt is used systematically, in quantities of about one ton for every 500 yards of six feet of roadway, once every week for the first month, and once a month afterward, is said to render the working in fiery seems a pleasure and profit, instead of being an abomination to the person working in the mine.

How to Utilize Soap Scraps.—A correspondent has been trying to utilize the small pieces of the various kinds of soap which have been gathered in the household, after having become too small for ordinary use. He says: "I have grated and heated to a thick consistency in a pail immersed in boiling water; but it will not harden when cold." Heat the mass in a copper kettle, with constant stirring until it becomes pasty, then pour out into a wooden box, and let the mass cool; then cut into cakes of convenient size.

Onions from Egypt.—There have been imported into New York, recently, from Egypt 10,000 barrels of onions. This is said to be the first importation from that region; the gardens of the Bermudas and Portugal having hitherto supplied the deficiencies of our home fields. The Egyptian onions are said to keep better and longer than those of more western countries, giving them especial value in ship supplies for long voyages. The Egyptian onion business is not as good as it was a few months ago.

Purifying Water.—Messrs. Edward Bohlig and Otto Heyne purify water by passing it through a series of cylinders with perforated bottoms, on which is a mixture of magnesia and carbonate of lime. The water enters the cylinder from below. The finely powdered magnesia of the mixture absorbs the carbonic acid of the water, and the carbonate of lime contained in the water precipitates in crystalline form.

Rubber packing may be made steam and air-tight by being brushed over with a solution of powdered rosin in 10 times its weight of strong water of ammonia. At first this solution is a viscid, sticky mass, which, however, after three or four weeks becomes thinner and fit for use. The liquid sticks easily to rubber, as well as to wood and metal. It hardens as soon as the ammonia evaporates, and becomes perfectly impervious to liquids.

Rotary Files.—A Connecticut mechanic has made a trial of rotary files for finishing planed surfaces. He is of the opinion that quicker and truer work can be done with these than with hand files, and that the surface is in better shape for truing with the shaper. His experiments have been confined to the planer, but he believes that his device may be properly and economically adapted to the lathe and milling machine.

Wool growing and spinning in Russia is almost universal, being as much, if not more, of a home industry than a factory business. Almost every peasant keeps a few sheep, the wool of which seldom enters commerce, but is spun and consumed at home.

Bronze Mixture.—H. H. Vivian adds antimony to the mixture for bronze. One mixture is 93.81 parts copper, 5.95 tin, and 0.24 antimony. For a bronze for shaft bearings the proportions are 83 parts copper, 15.5 tin, and 1.5 antimony.

Copper in Montana.

The Butte *Miner* says: Notwithstanding the apparent quiet which pervades the camp, very rich developments are constantly being made. It should be remembered that Leadville at one time had a population of nearly 40,000, and the bullion shipments are much larger to-day when they cannot claim over 20,000. The principal matter of interest perhaps is the tracing of the copper belt, and it is now demonstrated beyond doubt, that this belt is at least three miles long and half a mile wide. Among those properties on which operations are being actively advanced may be mentioned the Parrot, Shakespeare, Colusa, St. Lawrence, Magna Charta; Anaconda and Larabie, the latter being in the foothills, across the valley from the works of the Montana Copper Company, and shows a strong vein of high-grade copper ore. The regular monthly shipments of copper matte from the Parrot and Colusa are very large, and the shipments of ore East for reduction from the St. Lawrence and Shakespeare are a matter of surprise to many. The strike of a four-foot vein in the Magna Charta, which will average across 24 per cent. copper, and 36 ounces per ton in silver, the opening up of quite a body of ore in the Mounton, the Bell of Butte with a two and a half foot vein, which carries 250 ounces per ton, a large body of fine ore in the La Plata, new hoisting works for the Esele, native-silver ore in the Clear Grit, the Dernier with remarkably high-grade ore, and we have a showing for the district, which is indeed flattering.

Besides these, quite a number of outside claims are yielding their regular quota of excellent ore, and altogether, our bullion shipments must average something like $600,000 per month.

Good Health.

Recovery from Hydrophobia.

A case of recovery from an attack of hydrophobia was related to the Academie de Medicine at the meeting of June 13, 1882, by M. G. Denis-Dumont, of Caen. The patient was a man, 38 years of age, of strong constitution and previous good health, who was bitten on April 16th, on the forearm, by a rabid dog, which had bitten the same day a woman and two children. The woman died of hydrophobia on May 20th, and the news of the death profoundly impressed the patient, who became restless, anxious, affected with extraordinary thirst, and complained of sore throat and of difficulty in swallowing. He refused all drink which was offered him, manifested a tendency to bite persons and objects around him, and presented convulsive attacks of the character so frequently met with in hydrophobia. He was taken to the hospital on May 23d, and none of the medical men in attendance had any doubt that he was suffering from hydrophobia. The treatment employed consisted in hypodermic injections of a centigram of pilocarpine, which caused an abundant diaphoresis and salivation. At the same time a draft was given of two drams of bromide of potassium, four drams of chloral hydrate, and an ounce of syrup of codeia (whether at a single dose or in divided doses, the report does not state). The symptoms presented a rapid amelioration, and on the 30th of May had entirely ceased. It seems open to question whether or not the case was one of genuine hydrophobia. When the symptoms commence with mental disturbance, distinctly excited by such intense apprehension of the disease as is excited by the news of the death of another person bitten at the same time, the case cannot be regarded as affording conclusive evidence on the therapeutical question. M. Bouley, however, announced his intention of communicating to the Academie at the next meeting, another case of hydrophobia in which recovery followed the use of pilocarpine.—*Lancet.*

The Value of a Clean Mouth.—Dr. Ambler, dental surgeon, says that one of the simplest means of preserving the teeth consists in cleanliness of the mouth. The first thing after rising in the morning, or from a meal, should be to cleanse the mouth thoroughly with tepid water. It is the custom in some parts of England and France, to rinse the mouth with warm aromatic water after eating. It is well to remember that this precaution not only tends to keep the teeth clean, but to clear the voice of those about to sing or converse. In cleansing the teeth three times a day, regularly, the formation of tartar is not only prevented, but such particles of food and such other extraneous matters as lodge about and adhere to them, causing irritation and inflammation, are by this means removed. The fermentation of vegetable substances in the mouth produces, indirectly, sulphuric acid, animal and nitrogenous substances producing nitric acid. These vitiate the fluids of the mouth and help the teeth on too certain decay.

The human hand is so beautifully formed, it has so fine a sensibility, that sensibility governs its motions so correctly, every effort of the will is answered so instantly, as if the hand itself were the seat of that will; its actions are so free, so powerful, and yet so delicate, that it seems to possess a quality instinct in itself, and we use it as we draw our breath, unconsciously, and have lost all recollection of the feeble and ill-directed efforts of its first exercise, by which it has been perfected. In the hand are 29 bones, from the mechanism of which result strength, mobility and elasticity. On the length, strength, free lateral motion and perfect mobility of the thumb, depends the power of the hand, its strength being equal to that of all the fingers. Without the fleshy ball of the thumb, the power of the fingers would avail nothing; and accordingly, the large ball-formed by the muscles of the thumb is the distinguished character of the human hand.

Effect of Sugar on the Gastric Juice.—Sugar has been denounced by modern chemists as a substance, the effects of which on dyspeptics are deplorable. A writer in the *Medicin Practicien*, however, does not partake of these fears. He cites the case of a dyspeptic doctor, who, for 20 years, had a terror of sugar, but who now consumes three and three-fourths ounces of sugar daily, without inconvenience. Entering the field of experiment in this direction, he found that a dog ate 80 grains of sugar with 200 of other food, and six hours afterwards its stomach showed but little food; the mucous lining of the stomach was red and highly congested, and the congestion of the liver was notable. An animal opened after eating 200 grains of food and no sugar, showed 90 to 100 grains of food undigested. Sugar, then, favors the secretion of the gastric juice.

Indications of Hair.—It is said that the story of Sampson has misled people into believing that abundant hair is a sign of physical or mental strength. Madhouses and idiot asylums prove the contrary. Esau, who was so easily duped out of his birthright, was hairy; the mighty Cæsar was bald. "Long-haired men are generally weak and fanatical, and men with scant hair are philosophers, soldiers and statesmen of the world."

Passing Events.

The starting up of the new hydraulic machinery at the Eureka Con. shaft, Eureka district, Nev., is a great event in that camp, as it will open up a new area of prospecting in Eureka. This hydraulic pumping machinery was made by the Risdon Iron Works in this city, and was put up and started under the direct superintendence of Mr. Joseph Moore. We have before described the plan in these columns.

The sale of two groups of copper mines in Clifton, Arizona, to Scotch capitalists for $3,000,000 shows the prominence copper mining is coming into in that region. Arizona will soon rival Michigan within a few more years.

A big find in Willow creek this week is noted in our "Mining Summary," as is also one in Idaho. We note also several important sales of mining property in Idaho and Montana. In Wyoming, also, a heavy sale of copper-mining property has recently been made.

The disastrous fire occurring at the Clipper Gap iron mines, in Placer county, this week, noted in another column, is a very severe setback to the iron-mining industry in California. The company is, however, going right ahead again.

Unification of Geological Literature.

It will be recollected by those interested in geology, that, at the Geological Congress of Paris of 1878, two principal subjects were proposed for discussion at the Bologna Congress, and each was referred to an International Commission named by the Congress. These were, first, "The Unification of Geological Nomenclature;" second, "Geological Cartography." On the 2d of April, 1880, the International Commission for the Unification of Geological Nomenclature was convened at Paris by the President of the Paris Congress, and the President-elect of the Bologna Congress; and the commissioners present at that meeting, having regard to the impossibility of drawing up anything like a complete report upon so vast a subject, before the meeting of the Congress, and feeling that there would be much advantage gained by settling the meaning of the terms commonly used to designate the larger and smaller divisions of the materials which make up the crust of the earth, and the portions of time to which they are assigned, recommended that, first of all, those questions of a general character should be considered, such as the definition of epoch, period, formation, rock, etc. A resume of the reports of the different nationalities was drawn up by the General Secretary, M. Dewalque, and presented to the Congress, and the discussion was taken upon it. America and England were regarded as one from the very first—a happy result of the friendly feeling that exists on all points between the two nations, and at Bologna, cordially upheld by Dr. Sterry Hunt.

Prof. Hughes, at a meeting of the Geological Society of London, announced that the conclusions arrived at were briefly: That the term group should be applied to the largest geological division of rocks, system to the next, series to the third in order of magnitude, stage to the fourth, and the French word *assise* was placed in the fifth place, it being left to other nationalities to use whatever word in their own tongue seemed most conveniently to represent this smallest defined term. The time words were, in descending order of magnitude, era, period, epoch, age—era corresponding to group, period to system, epoch to series, age to stage. It was pointed out that the German and English use of the word *formation* for a set of deposits which it was desired to group together under one head, *e. g.*, carboniferous formation, could not be adopted by the French, with whom this word always had reference to the origin of the mass, and was considered an abbreviation of the "mode of formation." This had been already fully recognized by the English committee, in the minutes of one of the meetings, of which the following resolution appears: "The term formation, having been used by continental geologists to denote the action by which a thing is formed, and its mode of formation, and its use in the sense accepted in England being given up in America, the committee recommend that the term be employed as rarely as possible in the English sense, and that such words as group, rock, bed, etc., be substituted for it." It was pointed out by the German geologists, that there were many nations who could not adopt "terrain;" and therefore, this word, also, was excluded from the more strictly defined terms. MM. Beyrich and Von Muller explained that the word series could not be conveniently introduced into German or Russian, and it was therefore agreed that the words section and *abtheilung* should be admitted as synonyms of series. It will be observed that there is a consistency in the group of words adopted in English; they are all what may be called synthetic; the analytic words, such as division, subdivision, section, etc., remain undefined.

Prof. Hughes regretted they were not able to transpose the words group and series, as it certainly would be more convenient to use series for the larger, and group for the smaller division; but it was not a matter of great importance.

MAKING THREE-DOLLAR ORE PAY.—Quartz mining, for several years an almost neglected industry in that section, has recently experienced quite a revival around Graniteville, says the Nevada *Transcript*. A number of men are prospecting with good results. The ledges are very large, but of low grade. John Hippert keeps 10 stamps of the Rocky Glen mill busy much of the time, on the ore from his own and his neighbor's claims. He realizes a fair profit from working ore that contains three dollars in gold to the ton. About the highest grade found in that locality goes $17, but pumping and hoisting works are usually necessary to the extraction of it. Mr. Hippert was in town recently, to sell a fine bar of gold from a recent crushing of the low-grade ore.

AT Pittsburg a movement is being made by the finishers, heaters and rollers looking to the organization of a new association which will be more conservative in spirit than the Amalgamated Association.

THE Desert Crystal Co. is building a mill at White Plains to grind salt. The mill is about completed, and will be run to grind salt for domestic purposes.

California Machine Tools.

The most prominent exhibit, of home-made machinery, at the Mechanics' fair is that of the San Francisco Tool Works. The exhibit is remarkable in several respects. In the first place, the tools shown are just such as are sold for service. There is nothing in them for display. Not an ounce of superfluous iron is seen, nor is there any attempt at fine finish to catch the eye. Three of the machines had to be taken from use in the works.

The company manufacturing these tools have had great difficulty in starting this manufacturers, but have been supported by a generous encouragement of the leading engineers of San Francisco. The industry is the only one of this kind on this coast, and is a rapidly growing one. The goods shown are worth some $10,000, and all the machines are from designs prepared here.

The superintendent, Mr. Richards, has had 25 years experience in the business, and half of which has been in Europe. He is interested in similar manufactories in Philadelphia, Pa., and Manchester, England. The shareholders of the company are among our prominent citizens, and wealthy public-spirited men, among whom may be named A. W. Bowman, W. A. Aldrich, and S. C. Bigelow.

The exhibit shown is one of the most important ever made at any of these fairs, since it illustrates the foundation and advancement of an entirely new industry, and one which will seem a leading position among our home manufactures. To foundry and machine men, a few notes on the new style machines on exhibition will be of interest.

Planing Machines.

These machines are made upon a new method. The tools move at a uniform speed for large or small work, the work remaining stationary. The machines operate without noise, are durable, and have the functions common to both planing and shaping machines. The first one was made in San Francisco, 1880. They are patented, and are now made in Philadelphia, Pa., and in Manchester, England, under licenses from here. The largest machine made cuts 19 ft. long and 36 inches wide; it weighs 7 tons, and stands on the fourth floor of a building.

Wheel Cutting Machine.

This machine varies so much from the ordinary arrangement, that in that respect it is novel. It is difficult to point out the new features. The machine is quite simple and consists of much less detail than is common in the ordinary type. The designs were made here, and a more improved one is now being made under instructions from I. M. Scott, Esq., for his firm in San Francisco. This machine has always been worked by apprentice boys, and requires no special skill, except a knowledge of tooth wheels.

Forty-Inch Drilling and Boring Machine.

This machine has both vertical and horizontal spindles, and is provided with two independent tables; one flat, revolving, and the other with a vice. These are, so far as known, new features. The driving and feeding gearing is all enclosed in the framing, and consists of less than one-half of the usual details. These machines are patented and were designed in San Francisco, the one shown being the second one made. The spindle feed is operated by friction, the surfaces being flat, one of leather, so the clutch may slip for any length of time without injury, and thus exert a constant and yielding pressure on the drills.

Engine Lathes, 25 and 30 Inches.

These lathes are from special designs, made here, and are patented. They are, so far as known, the only lathes made wherein a screw-feed is operated by friction clutches, and starts instantly. The frames are of the hollow-box form, and very stiff. The carriages are mounted on rectangular trays, with broad-bearing surfaces, and are gibbed whole length, positively. The carriages move, it is believed, with less than one-half the usual power required. The gearing on the 25 inch lathes is the same as is usually employed on 33-inch lathes. The screw-trains out all standard threads, from 5 to 18, by changing one wheel only.

Seventeen-Inch Engine Lathe.

This lathe has some new features besides what has been explained, respecting the larger sizes. The feed motions are all driven, both from the screw on front and the rod at the back, so that either can be used, one being positive, and the other frictional. The apron gearing, it may be noticed, is all outside the apron. There are three separate clutches to control the feed. This lathe was in use three months on seven work, and operated by an apprentice during that time.

Sixteen-Inch Special Lathe.

This lathe is called "special," because varying in many respects from those made elsewhere in this country. The parts are nearly twice as strong as on common lathes sold at the same price. The back gearing is placed in two adjacent trains, and the cones, belt gearing, and so on, are double the usual standard; the feed starts instantly by friction. These lathes are patented, and are made in Philadelphia, Pa., under license from here (by Messrs. Walker Bros.).

Small Lathe with Compressed Rest.

This lathe is one taken from some mode in competition with an Eastern firm, at the same price. It has no new features, but a number of small improvements in detail; the slide rest, for example, has a longer range, is better fastened, and the whole machine is one-third heavier than those made at the East.

Forty-Inch Grindstone Frame.

This is a plain, strong machine for uses where there is danger from water leaks, and has no new feature, except the rectangular box, which seems a better form, as it permits room for debris and water at the corners.

Suspended Drilling Machine.

This is a plain, strong machine, without novel features, unless it be the gearing. It is intended for drilling heavy pieces that are mounted on trucks, or can be used for common purposes.

Thirty-Six-Inch Bracket Drilling Machine.

This is also a cheap, simple machine, with very strong proportions, intended for plate drilling, blacksmith work, and so on. The machine can be set out four feet or more, and provided with any kind of table the work may require. This machine is from designs made here and adapted for local wants.

Plan of the Denver Exposition Building.

In our issue of August 26th, we gave an illustration showing the general appearance of the building in which the Denver Mining and Industrial exposition is now being held. We now show the ground plan of the building, and also locate the various exhibits therein. The building has its longest arms extending north and south, the mineral exhibit being comprised in the ground-floor space of the north arm. The machinery is in the south portion of the building. Below will be found a list of the exhibits, with their locations.

1. Union Pacific Railroad
2. Union Pacific Railroad
3. Wyoming Territory
4. Unoccupied
5. Custer county
6. Park county
7. Fremont county
8. Saguache county
9. Dakota Territory
10. Gunnison county

107. Miners' Rock Drill
108. Commissioners of Mineral Exhibit

MICROSCOPICAL SOCIETY.—A regular meeting of the San Francisco Microscopical Society was held Monday evening, Vice-President Norrie in the chair. Mr. Norris presented to the society slides of diatomaceous earth, in Calvert county, Md., which contained some rare and interesting forms. C. H. Denison presented slides of eocene washings from Paris, containing foraminifera, and Dr. G. M. Sternberg handed in a slide of pollen grains of the passion flower, *Passiflora cerulea*, mounted in glycerine, which was a very beautiful object. Dr. Sternberg, by request, mounted another slide from the flower which he brought with him, to show his method. He takes a watch glass with some alcohol in it. Taking a ripe anther, he dips and agitates it in the alcohol, and the pollen grains, detaching themselves, sink to the bottom. The alcohol removes any mucilaginous matter which may adhere to the grains, and does away with air bubbles. The alcohol is then poured off carefully and the grains remain in the watch glass. Glycerine is then poured on, and poured off again until the alcohol is completely removed. The grains are then transferred to a slide on which a shallow cell has been turned with zinc cement, the cell being filled with the glycerine and a cover put on. Dr. Sternberg spoke of the pollen grains of the passion flowers, the acacias, the primrose family, the gourds and others as beautiful objects for the microscope.

The Denver Exposition—No. 5.

[Editorial Correspondence.]

DEAR READER, we wish you were here to take in, to see, to listen and to study, as it is the privilege of the writer to do. To a California, or any other, miner for the precious metals, the sight is

Grand and Enchanting

Beyond expression. The ores here are so diverse, so different from anything met with, on an extensive scale, in California, or, in fact, in any other part of the world, that the visitor wanders through the mazes of the building and the winding ways that separate the various exhibits wondering if he is not in some enchanted land—some real El Dorado, where the mines are actually at work, bringing to the surface and piling up the precious treasures from the very bowels of the earth below. He is aroused from his reverie only by the presence of the moving things about him, or by the band striking up some well-known air from its central station, or perhaps perched high aloft upon the gayly decked pavilion of ambitious Gunnison county, from whence it is sometimes invited to dispense its martial strains. If that is not sufficient, he has only to look up for a moment and direct his vision through the open windows, where he will behold in plain sight, and within an hour's ride by rail, the abrupt foothills, and beyond them, the snow-capped mountain range, from beneath whose huge proportions have been drawn all the varied treasures which are garnered here in such rich profusion.

This exposition is, beyond question, the finest mineral display ever made in the history of the world. It is one of the most important forward steps in the present grand march of mining industry. More than fabulous wealth is here displayed. The miner's and prospector's wildest dream is more than realized here. This exhibit is a great object lesson—better than lessons from books, because here we have the living tongue and the practical demonstration of that which we would learn. The mines can here be studied better than upon the actual ground, from the fact that we are here better able to institute comparisons and to study the different ores and mineral from different districts in all their diverse varieties of formation and position. We have them here, from the beautiful and precious specimens adorning the carefully selected cabinet down, or up—as you may prefer—to the general average of the ore and country rock, just as it comes from the mine, from nut size up to mammoth masses of several tons' weight. And they are still coming in. Not a day passes but some, more or less, additions are made to the grand aggregate of exhibits.

We have here, within the walls of this structure, a veritable Golconda of earth's treasures—coal, lime, marble, and other building stones, iron, copper, lead, etc., silver, gold and the precious stones, such as opals, agates, amethysts, saphires, agatized wood and other petrefactions. We have, also, samples of ore showing traces of that rare substance, vanadium, used for dying the most costly silks, worth many times its weight in gold—full $10,000 per pound, when collected and isolated. All these from the mines of Colorado and the neighboring States and Territories. We have also here on exhibition, but not a native of our own soil, a genuine $10,000 diamond of the first water, radiant with every tint of the rainbow, and shining as if with its own light, and not that borrowed from the sun. But

What Most Amazes the Visitor

Is the extent, mammoth proportions and vast wealth of the exhibit, with almost millions in sight, and fully billions represented. Yet California is not here; not a single specimen, not a dollar of the $2,196,000,000 of precious metals which that State has added to the wealth of the world is here. I am happy, however, to say that but one prominent man in all the State, to my knowledge, raised his voice publicly against making an exhibit here. Circumstances, already understood in San Francisco, among which red tape formed a conspicuous feature, blocked the way to a California exhibit.

Had California come here, as she might have done, with but a portion of the treasure which she holds in her own right as a State, and most of which is nailed up in wooden boxes, and packed away in the dark and gloomy cellars of her State house at Sacramento, doing nobody any good, gratifying no one's taste for the beautiful and valuable in nature, collected by the State at great expense of time and money, and yet doing nothing to develop, or to interest others in the development of, her mineral wealth. Had California come here, I repeat, as she might have done, she would have put the Cap Chief upon all this grand exhibit, and done more by such an exhibit and such a contrast, to raise the State in the estimation of the world's representatives, who are visiting this exposition by thousands than would have paid the expense of the exhibit 20 times over. Such an opportunity was never before, and in all probability will never again be presented: for a second exhibit of the kind, no matter if its merits are even greater, will lack the enthusiasm of this in every particular. It will be like a twice-told tale. California has thrown away her golden opportunity, which may never return.

A Surprised Englishman

I had the pleasure, a few days since, of meeting Mr. J. H. Taylor, one of the best and most reliable mining engineers of England, and at present residing in London. He had spent several days at the exposition, and is now on a brief tour of inspection to the various important mining centers. He says that the display of ores and mines at the exhibition is actually astonishing, and that the exposition is far ahead of anything he had thought possible. He had seen enough already to satisfy himself as to the wealth and permanency of the mines, but, as a matter of course, he must visit them. On his return, he will hasten back to London, satisfied he can recommend Englishmen who have capital to invest in Colorado mines. He does not manifest any desire to travel farther west to take in California. That State is now a comparative blank in his mind, as it is to many other distinguished visitors and capitalists from the East and from Europe.

Gen. J. W. Denver.

The man for whom this queen city of the plains was named, is now on a brief visit to the State for the second time, in company with his wife, son and daughter. His coming was anxiously looked for and will form quite an event in the exposition annals. I had the pleasure of meeting him a few days since. When he learned that I was from California, he held my hand with a firmer grasp, and for a moment seemed lost in retrospect. He soon, however, recalled his thoughts, and inquired for several of his former friends in the Golden State. He evidently holds in warm remembrance his early residence in California. The Governor is now in his 64th year, but still hale, hearty, and appears good for 20 years more of active life. He is evidently very proud of the young metropolis which bears his name, and feels confident that it will, ere long, become one of the principal cities of the Union. He delights to dwell upon the story of its early history, and the citizens are proud of the man who gave his name to the city. He first passed through this valley on his way to California, in 1850 at which time it was generally contended that the great plains, and especially this portion of them, could never be cultivated, or otherwise utilized. The General thought differently then, and when a few years afterwards he was appointed Governor of Kansas Ter., in which this valley was then included, he gave his active aid and countenance to the first attempt to settle the valley, an effort which was successful, and thus indirectly opened to the world one of the most valuable mining regions known. He now takes a just and honest pride in his prophetic vision, and expects to live to see Denver a city of a quarter of a million of people, and Colorado supporting a population rivaling even that of Ohio, which still is now his home.

Clear Creek County.

Immediately adjoining Gilpin county, which formed the subject of my third letter, and on the south, and directly along the great mineral belt of the State, is Clear Creek county. Lake, alone, excepting this, is the most extensive silver-producing county in the State. Its product of gold and silver for 1880 was, in round numbers, $3,000,000. The total product of the county up to Jan. 1, 1882, was $24,445,771. This, for a county only 30 miles long by 15 wide, is an output of bullion which may well create a flutter in any mining community. Still, mining proper there has but just commenced, as only a few of the mines have as yet been opened to the water level of the neighboring streams. As in most other localities, the gold and silver-bearing quartz veins were first discovered by the miners being led up to them while working the streams. The increase of annual yield has been very uniform. The yield for the past 12 years has been $911 for every person engaged in mining in the county, including prospectors.

In a well-prepared report before me, from 38 mines in one district, the milling average of the ores was from 392 to 604 ounces of silver to the ton. In another district, the average is from 450 to 560 ounces. This does not include the lead, which often forms quite an important item.

Gold Product.

In this district alluded to above, the Big Chief just being opened, gives a working result of 20 ounces of gold, 8 ounces silver and 17 per cwt. of copper. Another mine in the same district is reported at 4 ounces of gold, 60 of silver and 50 cwt. of lead. The most of the mines which carry a preponderence of gold are located in the northeasterly portion of the county, and at the point nearest to the gold mines of Gilpin county. The veins there are very similar in all their characteristics to those of that county, and may be considered as practically inexhaustible as any mines can be. The most of the ores are low-grade, but it is thought that if good smelting furnaces should be erected near these mines, whereby the sulphurets could be utilized without cost of transportation, the yield of bullion would be materially increased. Time will make this all right. Quite extensive placer mines have for many years been, and still continue to be worked, along the several small streams of this county.

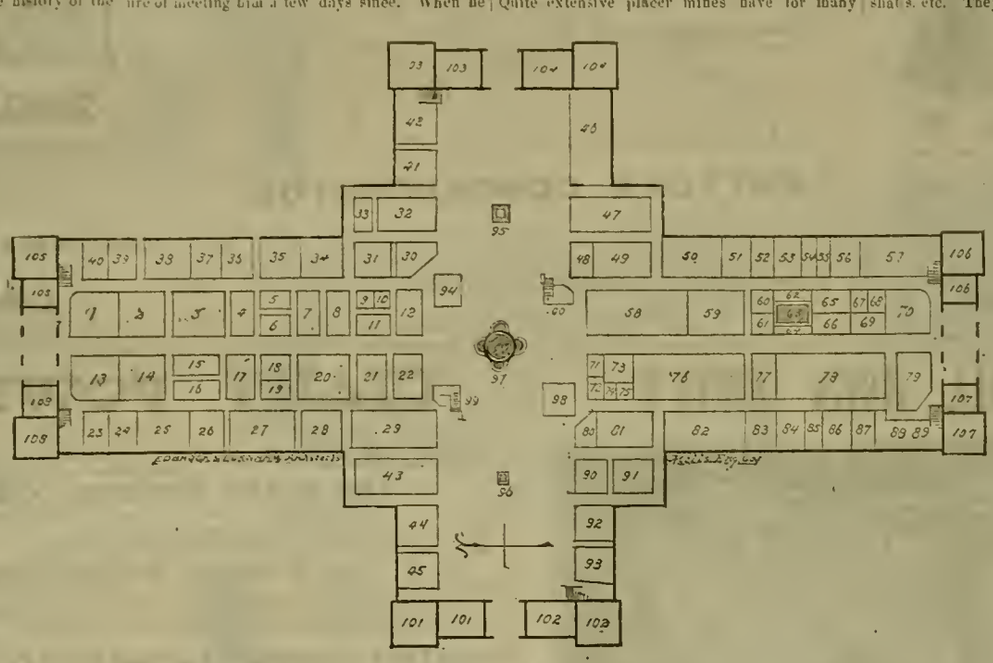

DIAGRAM OF THE EXPOSITION BUILDING, LOWER FLOOR.

Character of the Vein Rock.

The greater proportion of the silver, according to the State Geologist Smith, is contained in the gray, yellow and purple sulphurets of copper, lead, zinc and bismuth sulphurets, a comparatively small proportion being desired from native silver or the true silver ores. The true silver ores, however, sometimes occur, but in small quantities, as ruby silver, glance, brittle, etc., with a small per cent. of iron pyrites.

There has been about $1,000,000 expended in the county in the erection of mills and other kinds of mining plant. The history of silver mining in this county and throughout the State generally, goes to show that there is full as much average success in this branch of mining, as in any other business open to industry. All that is needed is a proper knowledge of the business, economy and practical personal energy.

Railroad Facilities.

The Colorado Central, a branch of the Union Pacific, penetrates to the very heart of the county, and has done much toward opening up its mineral resources. Other railroads are in progress, or contemplation by other companies, by which the country will be benefited. It is expected that a railroad will soon be opened up through this county direct to Leadville, and the western slope of the Rocky Mountain divide. This improvement would be of immense advantage to both Clear Creek and Leadville—to the latter, by greatly shortening the present roundabout way of reaching that important mining locality. It may here be remarked that no State in the Union is more rapidly securing railroad facilities than Colorado. Denver has already become a most important railroad center. This matter will form the the subject of a special letter in the course of the present series. No one who has not visited this State and passed over some of the most important railroads can form any adequate idea of the daring engineering feats in this direction, which have already been accomplished here. A few days ago I descended over 600 ft. in about four miles on a narrow-gauge road from Central City to Black Hawk. The distance by the common road is one mile, which I ascended on foot. The railroads are properly supplemented by wagon roads, so that nearly every mine in the county can find ready access to railroad communication.

Medicinal Springs and Scenery.

There are many points of great interest in this county to the tourist and health seeker. Few places more desirable in that respect can be found than Idaho Springs, the center of the gold district, already described. Its soda baths have become world-famous, and made it a popular place of resort. There are numerous other points of interest, such as beautiful natural parks, high points of elevation, etc.

Georgetown, the County Seat,

Also the central point of the silver mines, and present terminus of that railroad, presents many attractions, and justly prides herself in wearing the proud title of the "Silver Queen of the Rockies," for here are located some of the most extensive and richest silver-bearing lodes in the State, outside of the Leadville mines, which are deposits and not quartz mines. Each company generally controls a group of mines, as the hills are everywhere threaded with veins of greater or less thickness, several of which can generally be worked to best advantage under one management.

The Terrible group now in the hands of an English company, and known as the Colorado United Silver Mining Co. (limited) is located here. That company owns some 10 or 12 veins, some of which have been developed to the depth of 1,300 ft., with miles of stopes, drifts, tunnels, shafts, etc. They have a very extensive plant of hoisting works, with large concentrating works for their low-grade ores. The rock is reduced with Blake's crushers and Cornish rods.

The Pelican and Dives, group of 10 or 12 mines, has also a very large and extensive development—fully five miles of drifts, tunnels, stopes, etc., with a fine plant of machinery for hoisting and pumping. This, as well as the other companies, ship their ore as it comes from the mine, to the public sampling works, where it is sold to the smelters after being properly sampled and assayed.

The Colorado Central group, of 8 or 10 veins, is also extensively developed, with steam hoisting and pumping works.

Very nearly the same works as above would describe the Seven-Thirty group, the Dunderberg, the Con. Bay Rock, the Diamond Tunnel Co., the Dunkirk Mining Co., the Lebanon Mining Co.'s group, etc. All these extensive works center immediately in or about Georgetown, in addition to some 20 or 25 other paying companies. The first, second and third-class ores of all the mines above enumerated have averaged, since Jan. 1, 1882, as per mill run reports, from 242 to 257 ozs. of silver per ton. The thickness of the veins range from four inches to eight feet. Nuggets of 1,800 lbs. weight down to cabinet specimens are on exhibition.

There are only two stamp mills in this county, and those are located in connection with the gold mines in the northern section. There is no furnace yet in operation, but a smelter is now being erected for the Freeland mine, near Idaho Springs. There are, however, five public sampling works, where ore is crushed to grain size for furnace treatment.

The Clear Creek Exhibit.

As the visitor at the exposition passes by the Clear Creek pavilion, his attention is first arrested by the gilded figures conspicuously and several times placed, "$24,445,771 to January, 1, 1882." He naturally stops to consider the characters which express such an enormous amount of treasure, then very naturally steps within the inviting enclosure to more carefully inspect the ores and minerals which are presented as the representative characteristics of the veins and rocks from which all this treasure has been realized. The figures read like fairy tales, and he looks around, thinking to see the gold and silver peering out from or binding together, in their precious embrace, the rocks and minerals with which the pavilion is filled. True, he is shown a few specimens of that character; but, by far the great mass of mineral, to the unpracticed eye, looks but little better than the unyielding rocks in a New England stone wall. But the gold and silver is there, nevertheless, and waits only for the large stamps or fiery furnace, and the genius and handicraft of man to bring them out to the light of day. The visitor reflects a moment longer, when his enquiring eyes generally meet those of the gentlemanly Commissioner, Mr. E. Y. Naylor, who is always ready to show the visitor around the pavilion, and explain to him everything of interest in connection with Clear Creek county and its interesting exhibit.

W. B. EWER.

CHICAGO **FRASER & CHALMERS,** ILLINOIS

MANUFACTURERS OF IMPROVED AND APPROVED FORMS OF

MILL AND MINE MACHINERY.

Having made extensive additions to our Shops and Machinery, we have now the LARGEST and BEST APPOINTED SHOPS in the West. We are prepared to build from the Latest and Most Approved Patterns,

QUARTZ MILLS

For working gold and silver ores by wet or dry crushing. The Stetefeldt, Howell's Improved White, Brunton's & Bruckner Furnaces, for working base ores. Rotary Dryers, Stetefeldt Improved Dry Kiln Furnaces.

SMELTING FURNACES,

Water Jackets, either Wrought or cast iron, made in sections or one piece, either round, oblong, oval or square. Our patterns most extensive in use. SPECIAL FURNACES FOR COPPER SMELTING. Slag Pots and Cars, improved form. Bullion and Copper Moulds and Ladles, Litharge Cars and Pots, Cupel Furnaces and Cars.

HOISTING ENGINES Large or Small for flat or round rops. Double Cylinder Engines, from 6x10 to 18x60. This latter size furnished J. B. Haggin for Glant and Old Abe Co., Black Hill s also Corliss Pumping Engines, 26x60, for Hoisting and Pumping Works, for 2,000 feet deep. **Baby Hoists for Prospecting, 4 H. P. to 6 H. P.**

Wire Rope, Safety Cages and any Size and Forms of Cars. McCaskell's Patent Car Wheels and Axles—Best in Use.

Principal Office and Works, Fulton and Union Sts., Chicago, Illinois. New York Office, Walter McDermott, Manager, Room 32, No. 2 Wall St.

Frue Ore Concentrator, or Vanner Mills.

Coarse Concentrating Works, Improved Jigs, Crushing Rollsrs, Sizers, Trommels, Rittenger Tables, and all other adjuncts for the proper working of Gold, Silver and Copper Ores, complete in every detail.

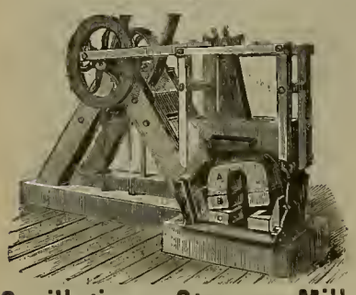
HALLIDIE IMPROVED ORE TRAMWAYS. We refer to Gen. Custer mine, Idaho, 5,000 feet long; Columbus Mine, Col., 4,750 feet long; Mary Murphy mine, Col., 5,000 feet long, all in constant operation.

LEACHING MILLS,

Improved Corliss and Plain Slide Valve Meyer's Cut-off Engines.

CORLISS ENGINES from 12x36 Cylinders to 30x60. PLAIN SLIDE VALVES from 6x10 to 36x36. BOILERS of every form, made of Pine Iron Works C. H. No. 1 Flange Iron, or Otis Steel. Workmanship the most carsful. All Rivets Haud Driven.

MILL AND MINING MACHINERY.



Oscillating Stamp Mill.

Ic has no Stems, Cams, or Tappets, and adjusts itself to the wear of the Shoes and Dies.

For simplicity, economy, durability and effective working, it exceeds anything ever presented to the public, and will do the work of five stamps with one-fourth the power. Awarded First Premium and Medal at Mechanics' Fair, S. F., 1880.

Manufactured by

F. A. HUNTINGTON, 220 Fremont St., S. F., Cal. | FRASER & CHALMERS, 145 Fulton St., Chicago, Ill.

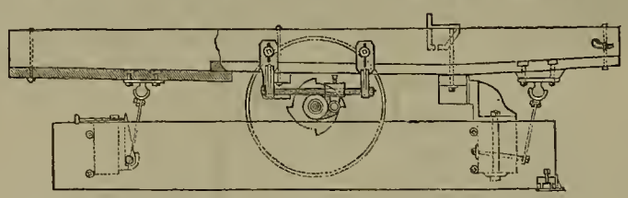
Improved Patent Grinding and Amalgamating Pans, Concentrators and Gold Amalgamators; also, Steam Engines and Mining Machinery of all kinds. Send for circulars.

F. A. HUNTINGTON,

220 Fremont Street, San Francisco, Cal.

F. A. HUNTINGTON,

No. 220 Fremont Street, - - San Francisco, Cal.

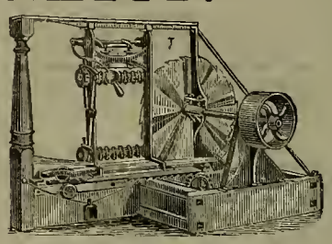


PATTEN'S CONCENTRATOR.

This machine requires less power, less care or attention, and is less liable to get out of repair than any concentrator now in use. All of which any practical miner will comprehend when seeing it in operation.

The wear and tear is nominal, and the construction so simple that any miner can put it up and run it; and the low price brings it within the reach of all mill men, as it will save enough to pay for itself in any mill in very short time. One machine will concentrate the tailings from a five-stamp battery.

☞ Send for Circulars. ☜



SHINGLE MACHINE.

For simplicity, durability and rapidity of action, these Machines have no equal, cutting from 3,000 to 4,000 per hour. They are now used by all the principal Millmen on the Pacific Coast.

SAWMILL MACHINERY,

Of all descriptions made to order.

GIANT POWDER.

MANUFACTURED UNDER ALFRED NOBEL'S ORIGINAL AND ONLY VALID PATENT FOR NITRO-GLYCERINE POWDERS.

All Nitro-Glycerine Compounds, for instance, so-called HERCULES, VULCAN, VIGORIT, NITRO-SAFETY Powder, Etc., are infringements on the Giant Powder Co.'s Patents.

THE GIANT POWDER COMPANY

Call Special Attention to their Improved Grades of Powder.

NO. 1.—The most Powerful Explosive Compound now in use here.
NO. 2.—Surpasses in strength any Powder of its class ever manufactured.
NO. 3.—This grade is a Strong and Reliable Powder, which does excellent work.

JUDSON POWDER

Is now used in all large Hydraulic Claims, and on most Railroads. It breaks much more ground, and obviates reblasting by breaking much finer. TRIPLE FORCE CAPS AND ALL GRADES OF FUSE.

☞The Giant Powder Company have also purchased from Mr. Nobel the inventor of Nitro-Glycerine, his latest invention, known under the name of

NOBEL'S EXPLOSIVE GELATINE

This explosive is from 50 to 60% stronger than the strongest Nitro Glycerine Compound and impervious to water. Even hot water does not diminish its strength. We are now introducing the same.

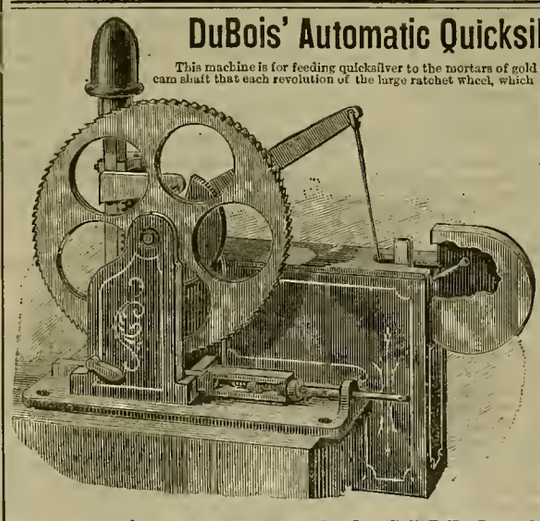
In Use for Seven Years Without a Single Accident.
TONITE POWDER CO.,
No. 310 California Street, - - - SAN FRANCISCO.

DuBois' Automatic Quicksilver Feeder.



This machine is for feeding quicksilver to the mortars of gold mills. It is so connected to the cam shaft that each revolution of the large ratchet wheel, which can be regulated to revolve once in one, two, three or four minutes, as desired, dips a small cup into a reservoir of quicksilver, and by a trip of the cam, empties the contents into a pipe leading down to the mortar, supplying an exact quantity at regular intervals, superseding the ordinary hand feeding, which is of necessity subject to great irregularity and liable to neglect. It renders the amalgamation of all the gold in the pulp equally certain and perfect.

The mechanism to produce this depression and elevation of the cup, is driven by the cam shaft, similarly to the self-feeders, over which so much ingenuity has been expended to regulate the delivery of ore to the mortar. As it is to be desired to have the ore go in constantly and regularly, so it is equally desirable to have the mercury fed constantly and regularly.

A chief point of excellence of this machine is, that it allows the quantity of mercury which would be otherwise fed in mass, in one hour, to be subdivided into a number of small portions, and fed almost continuously; i. e., from every one to four minutes.

Price, complete, $75.

For Sale by **WHITNEY & MARSHALL,** Sole Agents
22 & 24 Fremont St., San Francisco.
Dealers in Iron, Steel, Hardware and Mining Supplies, Wrought Iron Pipe and Fittings, Pump Columns, Wire Rope, etc. A large stock of Boiler, Plate and Sheet Iron of every description.

WATER JACKET SMELTING FURNACES
—FOR—
Galena Silver & Copper Ores.
The PACIFIC WATER JACKET SMELTERS embrace many features that are entirely new and of great practical utility, which are covered by letters patent.
No other furnaces can compare with these for durability and in capacity for uninterrupted work.
MORE THAN SIXTY of them are now running on the Pacific Coast, giving results never before obtained as regards continuous running, economy of fuel, grade and quality of bullion produced. We are prepared to demonstrate by facts the claims here made.
These Smelters are shipped in a complete state, requiring no brick or stone work, except that for the crucible, thus saving great expense and loss of time in construction.
Complete smelting plants made to order of any capacity and with all the improvements that experience has suggested as valuable in this class of machinery. Skilled and experienced smelters furnished when desired to examine mines and to superintend construction and running of furnaces. Estimates given upon application.

News in Brief.

THE natural gain of population in Germany ie put down at 500,000 a year.

GREAT damage hae been done by storme and floods in the south of Spain.

FROM the eale of tobacco France derives a revenue amounting to ahout $50,000,000.

THE authorities of Odeeca are taking precautione to prevent the introduction of cholera.

PATENTS for cer-couplere are issued from the Patent office at Waehington at the average rate of one every day.

THE Board of Managere of the Milwaukee Exposition bave rejected a propoeition to keep the exhihition open on Sundaye.

RAINS have caused a great riee in the Jsmes river and tributaries, the streams overflowing the low lande and deetroying property.

THE Texas-Mexican railway hae been completed from the American border to Monterey, snd the Mexican Central ie almost finiehed to Chihuahua.

IT is stated that telegraphic communication will be opened between Guaymae and San Franoisoo before the first of next month by way of Beneon, A. T.

SIX hundred and fifty limee from a eingle bud, budded two yeare ago on a lemon etock, ie the result of an Orange county, Fla., man's experiment.

THE ieeue of etandard eilver dollare from tho minte for the week ending Sept. 9th, wae 411,000, against 451,000 for the correeponding period of last year.

A ST. LOUIS compsny ieeues ineurance policiee on the lives of infante, the parente psying five oente a week and getting $35 if the child diee, "to cover funeral expenees."

THE vessel which John Kruee has started to build at North Bend, will he a steam echooner, for the Creecent City trade. Her keel ie 138 ft., beem 30 ft. and bold 12 ft.

THE volume of bueinese at Wilmington barbor ie steadily on the increaee. On Friday laet, two traine—one of 61 care with double-header enginee, and another of 23 care—were required to transport the freight to Loe Angelee.

IT has been diecovered that Major Phippe stole and eold tbe copper roof off of the Philadelphia alme-house for $7,000. It wae replaced hy a cheap one, which is yet unpaid for.

IT is rumored in Ssnta Cruz that the Southern Pacific Railroad Compsny has bought a lerge portion of the Ssnta Cruz heach and intend erecting a hotel and making other improvements.

AT a recent meeting of the Univereal Union of Maetere of The Culinary Art, a Pariein society of over 1,000 membere, it wae decided to eetablieh in Parie a professional school of cookery, and to hold a grand Culinary exhibition in October.

THE number of salmon eggs taken at the United Statee Fishery, on McCloud river, hae only reached 650,000 so far thie eeaeon. It is expeoted tnat ahout 3,000,000 egge only will be sent Esst thie year, which is about half the annuel ehipment.

ARMED bands of Alhaniane, at the frontier of Alhania, attsoked the Montenegrine near Podgaritza on the 5th and 8th inetente. The Montenegrine addreeeed a protest to the Porte, and requested the intervention of the powere whicb signed the treaty of Berlin.

MILWAUKEE ie in financial etraits, owing to the gross mismanagement of ite former officiale, and the concealment hy the preeent officere of the neglect. There will he no money to carry out the neceeeary improvemente or to pay inereet on the debt until next year.

MILWAUKEE newepapere are full of diecuesion concerning a local hoycotting caso. The latest move ie the refusel of a hrewing company to take 1,200 tons of coal according to contract, hecause the cosl dealer eigned a petition aeking the manager of a theater to cloee on Sundaye.

NINETEEN tone of peacb pits were shipped laet year from the orchard of the late William Hilgere, on Feather river, eix miles from Oroville; also, 33 tons of dried peaches. Thie orchard occupiee 160 acres, and was eet out by George Briggs, formerly of Yuba conuty, near Maryeville, about 29 yeare ago.

THE Creecent mills and elevatore, Denver, were hurned to-day. The estimated lose is $225,000—fully insured. The elevatore were the largest in the State and full of grain. The fire originated from a epark from the lime kiln acroee the etreet, which burned early in the evening.

THERE ie another likely story from Oregon: Major Jenninge, of Clackamae, while driving into Oregon city, on Saturday, to depoeit $700 in the hank, wae robbed by a tramp, who jumped into hie wagon to ride, and pulling a sack containing the coin from his pocket, eecaped.

SURVEYOR-GENERAL Atkineon, of New Mexico, bas eppioved a grant to the city of Alhuquerque of one league a square, heing two milee and a half each way from the center of the city. Thie grant is approved under the treaty of Guadalupe Hidalgo, which allowe one league of country to each town in existence at the time of the American occupation. Thie decieion is one of much importance to Albuquerque, ae it will settle land titles to property worth huudrede of thousande of dollare.

Sewing Machines.

Several first-class styles, good as new, will be sold at a bargain. Call on or address H. F. D., at this office.

PATENTS AND INVENTIONS.

List of U. S. Patents for Pacific Coast Inventors.

From the official list of U. S. Patents in DEWEY & Co.'s SCIENTIFIC PRESS PATENT AGENCY, 252, Market St., S. F.

FOR THE WEEK ENDING SEPTEMBER 5, 1882.

263,744 —STOPPER FOR BOTTLES—John Q. Adams, Sacramento, Cal.

263,674.—COMPOUND OPTOMETER—L. A. Berteling, S. F.

263,675.—THRASHING MACHINE SEPARATOR—John B. Bloom, Dixon, Cal.

263,755 —EAR-RING—S. L. Braverman, S. F., Cal.

263,765.—CAR COUPLING—A. W. Coats, Yuba City, Cal.

263,722.—FRUIT-JAR FILLING ATTACHMENT—Wm. M. Doty, Biggs station, Cal.

263,788.—TUCKING ATTACHMENT FOR SEWING MACHINES—A. A. Fisher and A. Hart, S. F.

263,782.—HAY SLING—A. F. Hillman, Stockton, Cal.

263,784.—PROTECTING PILES—Wm. N. Horton, S. F.

263,911.—LUBRICANT—Chas. J. Inman, Eureka, Cal.

263,789.—PLOW—Jas. W. Jory, Marysville, Cal.

263,912.—DRIER FOR FRUITS, ETC.—H. S. Jory, Salem, Oregon.

264,041.—ROPE RAILWAY—Joel B. Low, S. F.

263,800.—CAR COUPLING—N. D. Mussey, Reno, Nev.

263,808.—DRY ORE SEPARATOR—P. W. Reardon, San Jose, Cal.

263,736 —MOLD FOR CEMENT PIPE—N. W. Stowell, Los Angeles, Cal.

263,751.—LUBRICATOR—H. Baldridge, San Bernadino, Cal.

263,929.—TRACE CARRIER—H. Marshall and C. S. Reinhart, Goldendale, W. T.

NOTE.—Copies of U. S. and Foreign Patents furnished by DEWEY & Co. in the shortest time possible (by telegraph or otherwise) at the lowest rates. All patent business for Pacific coast Inventors transacted with perfect security and in the shortest possible time.

Notices of Recent Patents.

Among tbe patents recently obtained througb Dewey & Co.'s SCIENTIFIC PRESS Americsn and Foreign Patent Agency, the following are worthy of speoial mention :

PRESERVING WOODEN PILES.—W. N. Horton, S. F. No. 263,784. Dated, Sept. 5, 1882. Thie invention relatee to a method of protecting piles from the ravagee of the teredo and other marine insects or worme; and it conaiste in boring a circular chamber uear the outeide, eo ae to leave a thin eurrounding shell from the end of the pile to a depth euifficient to extend to the bottom or soil into which the pile is driven, and then filling this epace or chamber with any suitable protecting or preserving enbstsncee which will prevent the entrance of the worm into the body of the pile. When the teredo attacks the pile it ie generally very emall, and doee not attain any great eize nntil it has imhedded itself into the wood for a long distance, the eize of the hole increasing with its progress; but with thie protecting shell, the progress of the worm ie arreeted at the outset, and further progrese is prevented.

EAR RING.—S. L. Braverman, S. F. Dated Sept. 5, 1882. No. 263,755. This ear-ring is constructed in a novel manner, whereby it may he readily eecured to the eer, and in such a manner that the lower or pendent etonee, or portion, may appear below the lobe of the ear without any apparent connection, when viewed from the front, with the upper etone or etud. Tnis is accomplished by means of a curved connecting-bar, or bars passing up from the lower portion behind the lohe of the ear, and secured by the end of the puncture pin. The object of the invention ie to provide an ear-ring that shall combine the eingle etud or etone with lower or pendent etonee or studs, and yet eo conceal the connection hetween them that they may appear entirely independent of each other, thereby making a neat appearance and a deeirahle ornament.

HAY-SLING.—A. F. Hillman, Stockton. Dated Sept. 5, 1882. No. 263 782. This relatee more particularly to a hay-eling in wbich a two-part or divided netting ie coupled together and made to encloee the load, and free itself. The improvement coneiste in the meane for coupling the sections of the nete, and in the meane for dieengaging them. The former consiets in interlocking hooke and eyes attached to the inner or lower hars of the sections, and the latter coneists in an arm or lever attsched to the inner bar oarrying the hooks, whereby it may be turned and the hooke disengaged from the eyes. The object of the invention ie to provide a hay-eling which, when the load ie in it, will safely retsin it, and which will easily diecharge it when ready.

CAR-COUPLING.—A. W. Coats, Ynba City, Cal. No. 263,765. Dated Sept. 5, 1882. Thie ie a new and useful car-coupling, in which peculiar epring-jawe, receeeed within the drawheade, are adapted to receive and close upon a coupling-pin. The invention consists in a two-psrt drawhead, receesed in each part of which ie a jsw sffected by a spring, and having a grooved face adapted to receive the pin, and in connection therewith, of a meane for releasing the pin from the jawe, consisting of certain connecting rode and levers.

CAR COUPLING.—N. D. Mueeey, Reno, Nev. This invention relatee to a novel car-coupling of that class in which a ewinging pivoted latch oloses the opening or front of the drawhead and receives the impact of the approaching link, wherehy it ie raised, and falle again through the link to eecure it. This invention oonsiets in the details of conetruction to accomplieh this ohject perfeotly.

TUCKING ATTACHMENT FOR SEWING MACHINES.—Alfred A. Fisher and Albert Hart, S. F., aseignors to Pacific Tucking and Msnufacturing Co. Dated Sept. 5, 1882. No. 263,778. The object of thie invention ie to tnck goode antomaticelly, and to provide an attacbment to hold the goods and direct them to the tucker. The first attacbment consiete in a meane for holding the cloth and gauging the width of the tuck, and gniding and receiving the goode when adjueted, and in a means for fixing the widtb of the space hetween tbe tucke, eo that it will be accnrate. The latter coneiete in a reel attacbment and frame, in combination with the tnoker, whereby large quantities of goode—such ae a bolt—may be handled with facility. Minor deteile of conetruction, wherehy certain improved resulte are obtained, complete the invention.

STOPPER FOR BOTTLES.—J. L. Adame, Sacramento. Dated Sept. 5, 1882. No. 263774. The etopper is adapted to be forced down into the bottle, and to return again to ite place and wedge iteelf in the neck when the bottle ie inverted. It coneiete in a metal ehank, having at ite lower end an elastic waeher, and a emall head at its upper end. It ie provided with eolid flengee or winge, projecting oppoeitely and witb peculiar diagonal epring arme or wings whicb, wedge the etopper in place. The object of the invention is to provide a etopper for bottles, eepecially for tboee which contain liquide from whioh gae escepee, which msy be readily fixed, and when in place will he wedged tighter by the gae preeeure below, and may he eaeily forced down to allow the liquid to be poured out.

LUBRICATOR.—H. Balbridge, San Bernardino, aseignor of one-hslf to W. H. Souther. No. 263,751. Dated Sept. 5, 1882. Tbie invention relatee to certain improvemente in self-lubricators for ehafte and axlee of that claee in whioh a traveling endleee spring, or chain, ie employed, to raiee, by adhesion or otherwiee, a portion of the oil in which it dipe at its lower end, and depoeit it upon the ebaft or axle over whicb it paesee ahove. The invention coneiste in a new and ueeful arrangement of these parte, in connection with a euitable oil reeervoir, or casing, containing epongee and a peculiar ecraper, to prevent wastage of the lubricant.

PLOW.—Jamee W. Jory, Maryeville. No. 263,789. Dated Sept. 5, 1882. The improvemente are more particularly in the conetrnction of the share, wbereby it ie adepted to receive a peculiar revereible point. The ohject of the invention ie to provide a plow-share, the cutting edgee of which can be easily removed and reversed when worn, and which, when in place, will be held firmly.

Agents Now Wanted.

Extra Inducements will be offered for a few active canvassers, who will give their whole attention (for a while at least) to our business. Apply soon, or address this office, giving address, age, experience and reference.

Old Papers Wanted.

Twenty cents each will be paid for a limited number of copies of any of the following Nos. of the MINING AND SCIENTIFIC PRESS, if received soon at this office: No. 1, of Vol. 13, 1866; No 5. Vol. 18, 1869; Nos. 1 and 26, of Vol. 20, 1870; No. 1, of Vol. 22, 1871. Also, 10 cents per copy for Nos. 2, 3, 4, 7, 10. 11, 12, 13 and 15, of Vol. 30, 1875. If any one who has files of back volumes of the PRESS, which they may like to dispose of at a moderate rate, will send us a memorandum of the same and the price, we may be able, sooner or later, to assist in their disposal.

For Sale.

A twenty-stamp steam mill, complete and almost new. Also, air compressors, drills and mining machinery. Anyone having a gold or silver mine warranting the investment, may buy this material on time by making monthly or quarterly payments. Address, CHARLES E. SHERMAN, Havilah, Kern County, Cal.

Attend to This.

Our subscribers will find the date they nave paid to printed on the label of their paper. If it is not correct or if the paper should ever come beyond the time desired), be sure to notify the publishers by letter or postal card. If we are not notified within a reasonable time we cannot be responsible for the errors or omission of agents.

SAMPLE COPIES.—Occasionally we send copies of this paper to persons who we believe would be benefited by subscribing for it, or willing to assist us in extending its circulation. We call the attention of such to our prospectus, terms of subscription, etc., and request that they circulate the copy sent.

REMITTANCES to this office should be made hy postal order or registered letter, when practicable; cost of postal order, for $15 or less, 10 cts.; for registered letter, in addition to regular postage (at 3 cts. per half-ounce), 10 cts

Mining and Other Companies.

Persons interested in incorporations will do well to recommend the publication of the official notices of their companies in this paper, as the cheapest appropriate medium for advertising.

IMPORTANT SEMI-TROPIC COLONY ENTERPRISE.

The Fairest and Best of Colonies.

THE REDLANDS,

In San Bernardino County, California.

Superior Soil, Climate and Irrigating Improvements.

The following information concerning one of the best-reputed and promising colony enterprises in southern California, is from the Riverside *Press*, of San Bernardino county, April 1, 1882:

A Model Settlement.

No place in California has sprung into public notice so rapidly and gained so deserved a reputation in so short a time as has the new tract of Redlands.

This tract is located between Old San Bernardino and Crafton on the south side of Mill Creek ditch and comprises 2,500 acres of as choice fruit lands as can be found in the State. The land is of a reddish clayey loam, not clayey enough to work hard, having sufficient admixture of sand to hold moisture and give the best results when planted to orchard or vineyard. The red lands of the State are everywhere celebrated as being superior for tree and vine.

The tract slopes to the northwest and commands one of the grandest views to be found in the State. To the north and northwest lies stretched out, several hundred feet below, the San Bernardino valley, with the towns of San Bernardino and Colton plainly in view, while, looking to the westward at night, the headlights of the Eastern-bound trains can be distinctly seen for 40 miles. Beyond the San Bernardino valley to the northwest, and stretching around to the northeast, the chain of mountains tower 9,000 ft. above the sea level, culminating in Mount San Bernardino, 11,000 ft. high, and Grayback, 11,550 ft. high, both of which stand up boldly from the Redlands point of view, and whose tops are covered with snow more than half of each year. Around to the left of the picture are the Cucamonga peaks, 40 miles distant, which complete the semi-circular mountain chain that makes such a beautiful background to the landscape. For mountain and valley scenery no more beautiful location can be found in the State than Redlands, outside of Yosemite valley.

Redlands is located 10 miles from the county seat, the same distance from Colton, and 15 miles from Riverside. The track of the Southern Pacific railroad runs one and a half miles from the center of the Redlands tract, and a depot will be established at once for the accommodation of Redlands, Lugonia, Crafton and Old San Bernardino.

The Redlands tract is laid off by running avenues from northeast to southwest, one-quarter of a mile apart and cross streets at right angles to those avenues every half mile, thus cutting the tract into blocks, each of which contains 80 acres. The avenues are each 100 ft. wide. The cross streets are 60 ft. wide.

Although the first work done on the tract by settlers could not be commenced till about the 1st of January, 1882, there are at the present time some 10 or 12 houses erected and in process of erection, with several to commence work soon. A number of tracts, in addition to those on which houses are being built, are being plowed up and planted to orchard and vineyard.

The lateness in the season when the land was bought by purchasers, prevented many from getting their land set out to trees or vines this year, but all who have purchased are making arrangements to plant extensively next winter and spring.

Town Plat.

Near the center of the tract is a town plat, consisting of 140 acres, cut up into lots ranging from an ordinary business lot to two and a half and five acre residence lots. Within this town plat, at the crossing of Palm and Center avenues, is a circular public park, with a fountain in the center. This park will be improved by the proprietors of the tract. Above the town plat will be constructed a small reservoir, from which iron pipes will be laid to supply the town with water under pressure.

The Water System.

is one of the most perfect in the State. The water supply comes partially from the South Fork ditch of the Santa Ana river and partially from private water developments in the Santa Ana canyon and other localities. The waters are to be conducted to a large reservoir, located in a canyon adjoining the tract, and distributed from this reservoir by means of cement pipes. These pipes will be so laid as to carry the water without loss to the highest point on each ten-acre lot. The basis of water supply is one inch of water, statute measurement, to each eight acres of land. This is ample, and up to the best irrigated tracts in the State.

Work on the water system is being pushed as rapidly as men and money can do the work. The dam to the reservoir, which is ultimately to be 60 and perhaps 80 ft. high, is now about half done; the iron discharge pipes and watergates are in position, and nearly four miles of the largest distributing pipes are already manufactured, and most of this is laid. This portion of the work embraces the 8, 10, 12, and 14-inch pipes—the heaviest portion of the work. The smaller pipes, none of which will be less than four inches, will be made and laid as soon as the larger pipes are completed.

The orange, lemon, apricot, peach and raisin grape, will grow here to perfection.

Following is a list of the property owners at the present time. Those who have made upon the tract are credited to Redlands, and the others to localities where they now reside:

Names.	Acres.
J. G. Cockshutt, Redlands	20

Total sold	1,004

Judson & Brown (San Bernardino, P.O.), owners of the tract, are energetic men, who leave no stone unturned to make their enterprise a success. They do not try to figure how little they can do and sell their land, but where they can put another thousand dollars and make the tract more desirable to first-class settlers. There is nothing shoddy about their operations. Redlands will stand in a few years as one of the finest settlements on the Pacific coast.

DEWEY & CO.'S

Scientific Press Patent Agency.

(ESTABLISHED 1860.)

Inventors on the Pacific Coast will find it greatly to their advantage to consult this old experienced, first-class Agency. We have able and trustworthy associates and Agents in Washington and the capital cities of the principal nations of the world. In connection with our editorial, scientific and Patent Law Library, and record of original cases in our office, we have other advantages far beyond those which can be offered home inventors by other Agencies. The information accumulated through long and careful practice before the Office, and the frequent examination of Patents already granted, for the purpose of determining the patentability of inventions brought before us, enables us often to give advice which will save inventors the expense of applying for Patents upon inventions which are not new. Circulars of advice sent free on receipt of postage. Address DEWEY & CO., Patent Agents, 252 Market St., S. F.

A. T. DEWEY. W. B. EWER. GEO. H. STRONG.

FIGARI & RICHMOND'S

BOILER AND TUBE COMPOUND.

AIR COMPRESSOR.

SPECIAL ADVANTAGES.

Absolute certainty in the action of the valves at any speed. Perfect delivery of the air at any speed or pressure. The heating of the air entirely prevented at any pressure. Takes less water to cool the air than any other Compressor.

Power applied to the best advantage. Access obtainable to all the valves by removing air chest covers. Entire absence of springs or friction to open or shut the valves. No valve stems to break and drop inside of cylinders.

Have no back or front heads to break. The only Machine that makes a perfect diagram. No expensive foundations required. Absolute economy in first cost and after working.

DISPLACEMENTS in air cylinder perfect. Showing less leakage and friction than our competitors and a superior economy of about 20 per cent.

Small Sizes made in Sections not to Exceed 300 lbs.

PACIFIC MACHINERY DEPOT.

The Korting's Injector is the simplest, cheapest and best in use. Will draft its own water, hot or cold, and feed under varying pressure. Send for Circular.

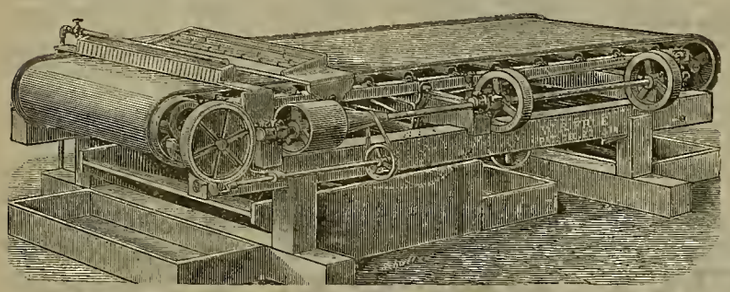
$1,000 CHALLENCE!



THE FRUE ORE CONCENTRATOR.

Nearly 300 are now in use, giving entire satisfaction. Awarded First Premium and Silvor Medal at the Industrial Fair for 1880 of the Mechanics' Institute of San Francisco, Cal.
Saves from 50 to 100 per cent. more than any other Concentrator in use, and concentrations are clean from the first working. The wear and tear are merely nominal; water required is less than in any other wet Concentrator; the power required per machine is less than one-half horse power; the labor required is light, one man on a watch can attend to sixteen machines.
We challenge any other Concentrator in use for a fair and impartial competitive trial, side by side, for stakes of $1,000 each, and we mean business.
A machine with all improvements can be seen in working order and ready to make tests, at the office of H nckley, Spiers & Hayes, 220 Fremont street.
ADAMS & CARTER, Agents, Room 7 No. 109 California Street, S. F.

Colorado Iron Works,
MANUFACTURERS OF
ENGINES, BOILERS, RAILWAY CAST AND WROUGHT WORK, BRIDGE WORK, BOLTS AND BOLT ENDS, BUILDING WORK, ETC.
MINING MACHINERY A SPECIALTY.

Our manufactures of mining machinery embrace every kind of machine and appliance for the mining and reduction of ores.
We have had an experience of more than twenty years in the manufacture and practical operation of mining machinery in Colorado and the neighboring States and Territories.
Our facilities are superior to those of any manufactory in the West, our works having been recently rebuilt, greatly enlarged and completely equipped.
We invite the investigation of mine owners and mill men seeking machinery. We can furnish, on board, at our works, or set up at the mines anywhere in the Rocky Mountain region, on short notice, the following machinery: Cornish Pumps, Steam Pumps, Stamp Mills for Wet or Dry crushing, Pans, Settlers, Agitators, Retorts, Bullion and Ingot Moulds, Reverberatory Furnaces, Bruckner Cylinders, Revolving Roasting Furnaces and Dryers, Melting Furnaces, Concentrating Machinery, Rolls, Crushers, Conveyors and Elevators, Ore Samplers and Grinders, Hoisting Engines, Water Jacket Furnaces, Slag Pots and Cars, Lead Pots and Ladles, Blast Pipes and Water Tuyeres, Blowers, Cupellation Furnaces, Market Kettles, Wire Rope Cages, Buckets, Skips, Ore Cars, etc. Estimates furnished and prices quoted on application. Send for illustrated catalogue.

Perfect Combustion of Coal.

Mr. P. H. Jackson, of No. 231 First street, in this city, has lately patented a device for the more complete combustion of coal by gases being continually drawn from the top of the burning fuel, down beneath the fire, and there mixed with a plentiful supply of atmospheric oxygen. The device is applicable to steamboats, steamships, locomotives, stationary engines, heaters, furnaces, stoves, etc. The drawings which are on this page only illustrate the invention as applied to stoves, and this is the form exhibited at the fair. In this device, fire-brick is unnecessary, as a plentiful supply of fresh atmosphere is continually circulated on the bottom, and on every side, and in the center of the burning mass. Mr. Jackson says: The small surrounding space, *g*, above the fire, whose area is slightly in excess of the cross-section of the smoke-pipe, is filled with this carbonate of soda, which attracts the carbonic-acid gas, and it is passed through the opening by an oblique-angled passage, which deadens the force of the draft, but is a free exit to the pipe, and out the chimney, and thus this fire-destroying element is passed off. The elementary constituents of bituminous coal are carbon and hydrogen; the useless ingredients are ashes, water, nitrogen, and the product of complete combustion of carbon is carbonic-acid gas, or fire destroyer.

In the engraving, *g* is a space for the bicarbonate of soda, which has great chemical attraction for carbonic-acid gas. This gas passes over the bicarbonate of soda, then through several holes at the top, into the dome, *k*, thence into a small smoke-pipe, *m*. The draft by the pipe, *m*, is light, and does not draw away from opening, *d*, but is an escape for what has been attracted through *c*.

An inside air-chamber is represented by *e*, and *f* is an outside one, by which the atmosphere is continually drawn by rarefaction, by the fire. By such action it produces a partial vacuum in the hydro-carbon chamber, *d*, which draws from the top of the fire those unconsumed combustible gases, by means of the pipe, *d*, and as the gases of hydro-carbon pass from the mouth of the chamber, *d* (see Fig. 2), they more readily mix with the air in chambers *e* and *f*, by the partitions being in corrugated form; *h* is an air-chamber entirely surrounding the fire, having hundreds of small orifices for the heated atmospheric oxygen to freely flow into the fire. A small space is left all around the top, by which it is delivered over the top of the fire with a whirl, to mix with the unconsumed gases.

Diagonal partitions are formed in *h*, by which the air is caused to travel over a greater heating surface; *i* is a central tube (for a boiler it would be an elongated chamber), like that of the Argand burner; it delivers the atmospheric oxygen in the middle of the burning fuel; *r* is the mixing chamber, where the hydro-carbon gases mix with the atmospheric oxygen and pour through the grate bars, *p*, chamber, *h*, and pipe, *i*. In Fig. 3, a handle is shown, that the grate may rotate, to let down the ashes, which fall through the air-chambers, *e* and *f*.

Heated air expands, but contains no more oxygen than when cold. One reason why a fire burns better on a cold day, and the flame more frequent at the top of a rolling mill's chimneys in cold weather is because the same quantity of air contains more oxygen, and is conclusive evidence that the air for a furnace in a cellar should be taken from outdoors, not only because it produces a better draft, but is a matter of economy. Every consumer of coal should understand these things, not as curious scientific facts, but as practical realities involving dollars and cents.

Fire-brick, and soapstone linings, and water backs destroy heat in the place where the ignited fuel rests against them. They are used to keep down the temperature in that part, to prevent the burning out of the furnace or stove. Consequently, as cold is the opposite of heat, and if heat be plus, cold would be minus, therefore, what ignited fuel may rest against these materials surrounding the fuel, will be reduced in heat to the temperature of the material it may rest against, and from this temperature it will be proportionably increased in the ratio of the distance to the greatest heat in the body of the fire; and as these linings surround the body of the fire, it is a large area of surface, is just so much heat-reducer to the extent of its surface, in contact with the ignited fuel, with the addition of its heat-reducing influence as described. Further, the ignited coal that lies against this cold surface gives forth its distillates of gases in the same manner as when fresh coal is laid on the top of incandescent coal in the body of the furnace, and with the ordinary appliances they pass off to waste through the smoke-stack or chimney. But with the best of smoke-burners, part of it may come in contact with a small and insufficient quantity of atmospheric oxygen and be consumed, and the balance, the major part, pass off out the chimney to waste.

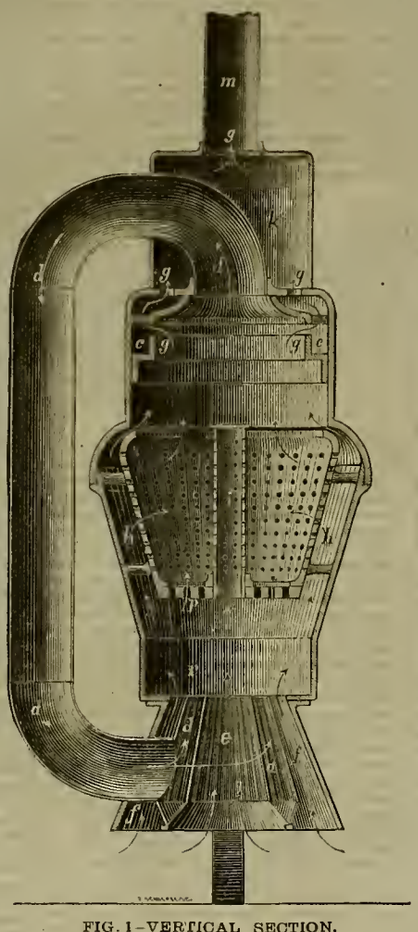

FIG. 1—VERTICAL SECTION.

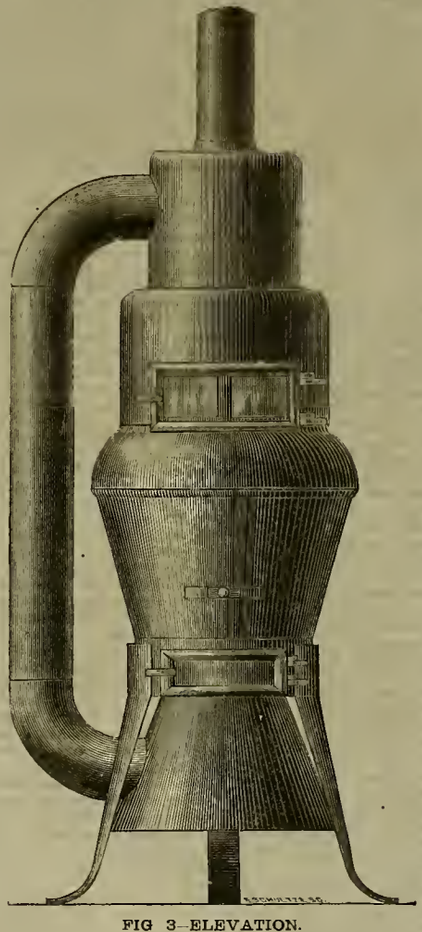

FIG 3—ELEVATION.

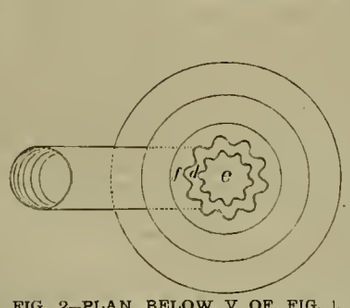

FIG. 2—PLAN BELOW V OF FIG. 1.

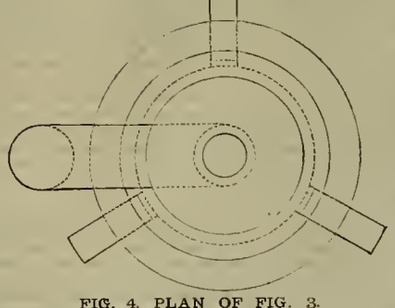

FIG. 4. PLAN OF FIG. 3.

In reference to the latter, the following extract is taken from the August, 1882, issue of the *American Inventor:* "The flame at the top of a rolling-mill chimney is caused by unconsumed gases that do not burn until reaching the oxygen in the air, the same as gas at a gas-burner, and it is not a continuous flame from boneath to the top of the chimney, as many suppose."

The notion that coal gas is consumed by coming in contact with glowing coals is erroneous. If so, all gas would be burned at the gas-house. It cannot be consumed by any possible degree of heat until it unites with air containing oxygen. Hence, these distillates not meeting with the requisite atmospheric oxygen pass off in an invisible gas, and are credited in the belief that they are consumed. Smoke, which is observable to us, is formed of the gases of hydro-carbon raised to a red heat, or thereabouts, without a mixture of atmospheric oxygen sufficient to produce combustion—disengage their carbon in a fine powder which floats in the hydrogen. This compound is smoke.

The perforated iron shell to the air-chamber, *h*, Fig. 1, in Mr. Jackson's device, will be kept at a low temperature, as in case of the fire-brick lining, as evidenced in that of the tin kettle before mentioned; but there is this difference: The atmosphere is the life of the fire, while the fuel is but supplementary, or in volume it is but a small, fractional part of the whole. As before stated, for perfect combustion of coal, there must be 12 times in weight of air to one in weight of bituminous coals, or, for every pound of coal consumed, requires about 200 cubic feet of atmosphere.

Will the reader consider how diminutive are the means for supplying atmosphere in our best modern appliances for burning bituminous coal by natural draft, to what is actually required for complete combustion. The iron inside shell to the air-chamber, *h* (Fig. 1), having several hundreds of small holes in it, and for large boiler furnaces, as in that for locomotives and others, thousands, by which the atmosphere flows freely into the fire, from the whole circuit, nearly as freely as if into the open air, leaving the fire to take on its natural conditions, and not be hampered with any artificial restriction, thus vitalizing the incandescent fuel by heated air, and overcoming, in part, if not wholly, by the supply of atmospheric oxygen at this place, the effect of the foreign iron shell at its reduced temperature.

Why should we introduce a foreign substance, antagonistic in its nature to the fire, as that of fire-brick or other linings, or the water back and sides of steam boilers, when heated air is required in every place possible to be obtained to vitalize the fire, and also when it serves another purpose to cool the lining, or shell, to preserve it the same as the iron-sheet of the boiler with the water on the one side and the other? The fire will, at its [illegible] on the natural conditions— [illegible] quantity of heated air, [illegible] shell to chamber, *h*, at a proper temperature for its preservation. [illegible] all the air it can take in. [illegible] naces, stoves and other [illegible] ing bituminous coal, [illegible] draft is used, take off the [illegible] doors, let the fire take up all the air it can possibly get, and regulate it by a stove or chimney damper. With the furnace at the fair of the Mechanics' Institute, in this city, as shown in Figs. 1, 2, 3 and 4, the burning hydro-carbon gases rising from the fuel, even when fresh black coal had been laid on and covered up, the incandescent coal beneath filled the consuming dome with flame from the top of the black coal to the roof of the dome, and what gas escapes unconsumed by not having sufficient oxygen at that place to unite with, is drawn through the pipe, *d*, and delivered at the bottom through *d*, between the atmospheric chambers, *e*, *f*, mixing and flowing upward through the chamber, *h*. The greater the heat of the fire, the greater will be the influx of cold air through *e*, *f*, and on same proportion will the unconsumed gases of hydro-carbon be drawn away arising from the burning fuel.

Contribution to the Ethnology and Geology of the Pacific Slope.

By Phillip Harvey, M. D., of Portland, Oregon.

H. G. Hanks, State Mineralogist of California: Sir.—I now proceed to comply with my promise to give you some of the views more in *extenso* and in writing that I briefly alluded to in my conversation the last time I met you. They mostly relate to the ethnology of our Indian tribes, and incidentally to some geological facts connected therewith.

Ethnology has followed Geology

In shaking off the trammels of a narrow chronology, and now Man, as well as the world he inhabits, is generally admitted to be of vastly greater antiquity than was supposed to be the case even a few years since. Besides, errors in regard to time, others arising from hasty generalization, false reasoning in regard to facts, and still worse, from giving too loose a rein to fancy, have infused so much fallacy into the current ethnology of our native tribes, that it has become, in many respects, but little better than a myth. Among these are whimsical notions about America being really the old world instead of the new one, and of man and the higher mammals having originated here, and gradually spread to other parts of the world; about the "Mound Builders" as a distinct race from the other Indians; about the "Lost Tribes" of Israel and their having wandered off to this continent; and other transatlantic migrations, by which America is fancied to have acquired inhabitants and civilization; and of California having been the Ophir of Solomon. All these views I look upon as being entirely baseless, though some of them are maintained by scientific and even eminent writers. Their fallacy in many respects has been exposed, but they are reiterated, and in fact some of them have taken so firm a root in the public mind that it will require persevering effort to weed them out. Part of my paper will be directed to this end, while part may be found to treat on more original topics.

Geology and the study of The Extinct and Living Fauna

Of a region, combined, supply us with the means of locating, approximately, the part of the world in which man must have originated. Geology teaches us that the different strata of the earth's crust are arranged in a chronological series, succeeding each other as States and Empires have done. Where no great disturbances have taken place, the uppermost strata are the newest, and the lowest are the oldest. As we descend, the forms of life are observed to change, differing more and more as we go down by limited, and sometimes, almost imperceptible gradations. The more ancient the fossil, the more is it found to differ, as a general rule, from the fauna and flora of to-day. At the same time, we notice that, usually, the more specialized or *differentiated* forms are the newer, and the less so are the older ones; in other words, the newer and more advanced types possess a more perfect definition of different organs for the performance of different functions. But these types have not changed everywhere with the same rapidity. They have changed most quickly in the old world, less so in North America, still less in South America, and least of all in Australia, where present leading types of life are, in form and pattern, the most ancient anywhere now extant and living; that is to say, on any extensive area. In this assertion, that Australian leading forms of life are the most ancient, it might, perhaps, be objected that on the Galapago islands, according to Chas. Darwin, no higher forms than reptilian, save birds that may have wandered there, were originally found; but, from such a narrow sphere no generalizations can be drawn. Still, however slight its importance, the fact serves to confirm the idea that organic progress is retarded to some extent in proportion to the smallness of the territory to which it is limited. The axiom may be stated thus: The smaller and more detached the tract of country, the more slowly it has changed its forms of life. Australian fauna of the highest types yet retain the characteristics that prevailed in other parts of the world when marsupial forms were there the most advanced. In the old world we find marsupials only among the fossils of tertiary times, and in the new world they have disappeared also, except a few small species. In Australia, there were, when it was first discovered, no apes, no carnivora, no ungulata and no edentata. Of its 132 mammalian species, 102 are marsupials, and the remnant consists of rodents, bats and strange monotremata. To these man was an intruder, and brought with him a carnivorous animal, the dingo or Australian dog. South America has also a fauna of its own, the most marked and characteristic of which are the edentata. All of its species, a majority of its genera, and even of its more comprehensive groups, are different from those of the old world. The original mammalia of South America and Australia, that is, of the time of their discovery, are more allied to the forms of tertiary times than in ours, and in both these regions, animal forms have changed more slowly than they have in North America or the old world. Before the upheaval of the Isthmus of Panama, an event of recent times, geologically speaking, South America was an island. According to the views of the evolutionists that are now generally accepted by scientists, these two districts retaining their ancient inhabitants are neither of them, a zoological province in which the most modern of all forms, man, can have originated. North America has in its flora and fauna much that is similar to, and some things that are identical with those of Asia and Europe; nevertheless, it has remained in some of its forms of life more ancient, especially in its two marsupials, *didelphis, virginica*, and *D. californica*.

The fact of the gradual Succession of the Forms of Organic Life

Is no longer a disputed point; but they need not have originated where found; they may have migrated from a distance, but in the absence of disturbances in the order of succession by migration, we have a right to expect that each form of life should everywhere have been preceded by the one next in rank below it. Anthropomorphous apes, or their vestiges, have not been found in America. They could not have crossed from Asia by way of Behring's isthmus from the inability of that family to endure so cold a climate, supposing, as we have every reason to do, anything like the present temperature of those regions extended as far back as the tertiary times in which the apes originated. To be sure, the temperature of high latitudes may have undergone great vicissitudes in the ice times, and the intercurrent mild periods recognized as interglacial, a point that I will again refer to; but this could not have enabled those animals that were fitted to dwell only among the tropics to have endured even the brief, though cold, winters that must have occurred in the warmest interglacial time in those high latitudes. These things forbid our looking upon any portion of the American continents as the primal home of man, which should rather be sought for in the native haunts of the orang, the gorilla or the chimpanzee, or regions accessible therefrom. Since we are precluded from considering America as the cradle of the human race, to arrive there, man must have crossed either ocean, unless the old and new worlds were formerly connected, as indeed they most likely were.

Man on the American Continent.

When man first put his foot on the western continent, I should say, rather, the American, he undoubtedly occupied a low position on the scale of moral development. He may have had a language, the bow and arrow and the art of making fire, though but little beyond; but neither language nor inventions afford the best criteria for determining the origin of a race; these are to be looked for in structural affinities —that is to say, in personal traits. A strong proof that the aborigines of America came from the other side of Behring's strait is to be found in their decidedly Mongolian features. The Asiatic and American tribes on either side of it are so much alike that you may still mistake one for the other, though probably hundreds of thousands of years have elapsed since their separation. To this close resemblance, that obtains from Alaska to Patagonia and through all the intermediate regions, all observers unite in bearing testimony. Oscar Peschel, of Leipsic, in his *Volkerhunde*, or "Races of Man," a recent work, than which none ranks higher as an authority, and to which I take this opportunity of acknowledging a large indebtedness, remarks: "In the writings of those who consider the American Indians a distinct race, we look in vain for characteristics that would serve to distinguish them from Asiatic Mongols. The coarse, long hair, cylindrical in its transverse cut, is found in all Indian and Mongol tribes. The growth of beard is always scanty, sometimes entirely wanting, and the hair on the body is sometimes wanting, too." These last traits, though common to both, are more marked in the Indians. In cranial measurements, also, our Indians closely approach the Mongolian tribes. In short, there can be no certain distinction drawn, and the "red man of America" is now very generally looked upon as a Mongolian offshoot.

We may suppose that not only man, but many of the large

Mammals That Have Since Become Quite Extinct

On this side, passed over into America from Asia by way of Behring's isthmus, that we must suppose to have occupied the present place of the strait so called, not only once, but at many periods in the world's history. I here refer to the elephant family, that multiplied on this continent down to comparatively recent times, as well as to the horse, camel, rhinoceros, and hippopotamus, species of which still endure in the old world, though they have become extinct in this. It is all but certain that these animals came from the Asiatic side, and that they came by land.

I refrain from alluding to a host of linguistic analogies, manners, customs, superstitions, tales, myths and arts that are common among Mongolian and Indian tribes, and that go to show an ancient connection, as it would only be multiplying proof unnecessarily, and extend my article to an undue length, and, as I have said, all these things are, as race characteristics, subordinate to personal conformation.

The Migrations of Man and Animals

From the Asiatic side of our neighboring sea may have taken place at various times during the pliocene and post-pliocene eras; the last one was probably during a mild interglacial period of the last glacial epoch, when the accumulation of circumpolar ice had been transferred from the northern to the southern hemisphere by the precession of the equinoxes during a maximum of eccentricity of the earth's orbit, according to Croll's theory, as explained in his work on "Climate and Time," to which I must refer the reader, my limits not allowing me to go fully into the subject here. The shifting of large accumulations of ice from the high latitudes of one hemisphere to those of the other, would necessarily take with it, by the force of gravitation, an amount of oceanic water, and in this way flood one region to some extent, and leave the other correspondingly deficient in water. Thus, the shallow sea of Behring's strait must have been converted into an isthmus in the interglacial times, and afforded land transit from one continent to the other.

The first crossing of man may have taken place subsequently to these animal migrations, and when the sea had resumed dominion over the shallows of the North, and given to Behring's strait its present form. An objection to this supposition exists in this, that he was not then sufficiently skilled to make sea-going vessels of any kind; under which circumstances he must have come by land. According to the astronomical calculations of Leverrier and Croll, the last eccentricity of the earth's orbit sufficient to have caused great glacial and interglacial times occurred somewhere near 200,000 years ago. Of these times there are supposed to have been several during the epoch of eccentricity, the two together covering a period of 20,000 years. It is most likely, then, that the advent of man to this continent occurred about 200,000 years since, during one of those mild and balmy interglacial periods, when the climate of the north part of our temperate zone was at its best, when the continents were united, and a sea of verdure, instead of water, extended from Kamtchatka to Alaska, covering both those regions also. Alaska was then well fitted for colonization; it was already well stocked with game of every kind, and in all respects suited to be a hunter's paradise. Here he throve and multiplied till the growing coldness of the on-coming ice time drove him south, at least beyond the the Columbia river, and probably to California. The continent "was all before him where to choose, and Providence his guide."

There Were no Enemies

Save the *feræ naturæ*, and on them it was his delight as well as his business to make war. Though mammoths existed on the North American continent before the time of man, they were cotemporary here in more recent times; for their remains have been found associated, in not very ancient alluvia, in many places. At Hangman's creek, in Washington Territory, the bones of at least two species of the elephant were found in 1876, *Elephas americanus* and *E. primegenius*, and I think a third, to which I venture to give the name of *Elephas columbianus*, after the name of the great river near which the remains were found. They all appear to have been mired in a swampy part of the river-bank, and were associated with a well-formed rough stone spear-head. From observations made in Europe, as well as in this country, human and mammoth remains were deposited together as recently as 8,000 or 10,000 years ago—perhaps even more lately. In regard to the greatest antiquity of these associated relics, Geikie, Pengelly, and other authorities, show that paleolithic implements and remains of extinct mammals have lain together in some of the European localities, where they are now found, for hundreds of thousands of years. We are unable to determine the antiquity of the associated remains of man and extinct mammals in America, but data, I think, are wanting for inferring with any degree of certainty that they are as ancient here as in Europe. There has been a great deal of dispute about the age of a human skull found in connection with mastodon bones beneath 140 ft. of alluvium in Calaveras county, California. This Professor Whitney supposes to have been deposited there as far back as the pliocene of the tertiary; but the age of the alluvium is doubtful. From the abundance of fossil ivory found in Siberia and Alaska we may infer that elephants were once more numerous in those regions than they are now in Africa. This could only have taken place in that mild and genial climate that prevailed in high latitudes during the interglacial times.

During the Tertiary Geological Period,

And even subsequently, this continent seems to have been nearly upon an equality with the old world in regard to its animals, though it has more recently fallen behind in that respect; for in deposits of those times we not only find abundant remains of elephants larger than any now found in the old world, but of lions, tigers, camels, horses, rhinoceroses, hippopotami, etc., equal in size to any found elsewhere, besides fossil remains of large and wonderful animals that have not been met with beyond either ocean, some of which, from their formidable array of horns, Prof. Marsh has arranged together under the name of the "dinocerata." The mammalian fossils of tertiary times brought to light by Hayden's surveys of Colorado, Utah, Wyoming and other parts of the interior of our continent, have filled the scientific world with astonishment. Upwards of 100 species that the world knew nothing about before have been discovered and described. Of species common to the two worlds only those that could sustain a low temperature and migrate through the colder parts of the temperate zone seem to have found their way into America. Camelopards and old-world apes, have not, I believe, been found here. It becomes interesting to inquire why every species of elephant, lion, tiger, camel, horse, rhinoceros and hippopotamus should have died out on this continent, while they still retain a foothold in the old world. I am inclined to refer the solution of this question to the fact that they were old-world products. Called into existence by old-world influences and surroundings, those of the new world were less congenial to them, and when the continents became severed, and they could no longer obtain an occasional importation of the parent stock to renew the blood and breed, they gradually deteriorated and died out, just as, in fact, our stock raisers find to occur, who pay attention to the breeding of blooded stock. Unless the blood is renewed by the occasional infusion of new material from the old source, the breed degenerates. That the bear alone, of all the larger mammals of the tertiary and post-tertiary periods that have found their way to America, still maintains its old supremacy, in regard to size and ferocity, in the new world, is probably owing to the circumstance that the deep, and almost inaccessible, forests of North America afford it a more secure and congenial habitat than is commonly to be found on the further side of the Atlantic. The postarity of the gigantic *Ursus speleus*, that has long since degenerated or died out there, still exists, probably, in the grizzly bear of the Pacific slope.

To Oscar Peschel we owe an explanation of the reason

Why the Old World should be Superior

In its animal products—I mean, especially, its mammals. It exists, he supposes, in its greater size, it being many times larger than the new one. He says: "All who have studied the geographical distribution of forms of life have been struck by the fact that the old world is far richer than America in large animals. The largest animal in South America is the tapir, and the most powerful one of the northern continent is the grizzly bear. The elephant, rhinoceros, hippopotamus and camel are wanting in the new world; but we find there the puma, ounce, alligator and platyrhine apes with prehensile tails. Contrasted with these, we find in the old world the more noble lion, tiger, crocodile and the anthropoid gorilla. Compared to the lion the cowardly puma is contemptible. When the poet calls the lion the king of beasts, he expresses a happy thought. To this monarch belongs a truly royal domain, which, though now much curtailed, extends through all Africa and Western Asia. Next to this stands the tiger, or 'royal tiger,' as this fearfully beautiful animal has been properly named, who has half a continent for his dominion; for from the Caspian sea it roams to the Amoor, where it extends its ravages to the frigid regions of the fur animals; while to the south it penetrates to the farthest point of Asia on the peninsula of Malacca, where it even swims over an arm of the sea and kills hundreds of men yearly on the little island of Singapore. The only feline in America that can be compared to the tiger is the smaller and far less courageous, though bloodthirsty, ounce, *felis onca*, which only attacks man when urged to do so by invasion or necessity. These contrasts have long since been noticed, and are enunciated in the old assertion that the new world is more favorable to vegetable and the old world to animal life."

(Continued in our Next Issue.)

Dos Cabezas Notes.

Last spring, William Fowler and John MacGregor located a placer claim in what is known as Park canyon, Dos Cabezas mountains. They took out some very coarse gold, some pieces being worth $20, but they could not do much at placer mining, owing to the scarcity of water, so they started prospecting for the place where the gold came from. About one and a half miles up the canyon, almost at the summit of the mountain, they found the ledge from which the gold came. The ledge, on the surface, is about four feet wide, one-half being almost solid galena, with coarse gold all through it, the other half being white quartz, with pieces of gold valued at from $1 to $10 all through it. In one day they took out $200 by picking out the coarse gold. The owners have run a tunnel on the ledge, and have one dump of ore that will average, to say the least, $500 per ton. As they have not had any of the galena assayed, it is impossible to say how much the galena dump will average. Fowler and MacGregor have eight claims in Park canyon. They have ice-cold spring water, an abundance of timber for mining purposes, and oak that is equal to any that is brought into the Territory for toughness of fiber and straightness of grain. They have also sugar maple and plenty of scrub wood for milling and domestic purposes. They have the richest mine and amplest facilities for mining and milling to be found in Cochise county. They work along very steadily, but quietly, and are not anxious that any excitement should be created on the strength of their find.

The Cincinnati and Pittsburg company's mill is still working on First Chance ore, which has averaged from $15 to $22 gold per ton.

The contractors completed the road to the First Chance mine on last Monday.

The mill company is putting up an ore chute at the mine, and when it is finished, the mill will be kept constantly running. The company employs 12 men at the mine.

Fitch & Co. have suspended work on the Mina Chiquita for the present. Charles Williamson is sinking another shaft on the Pumpkin mine, Silver Camp.

The Commonwealth Co. is pushing prospecting work in Wood canyon.—*Tombstone Epitaph.*

Mechanical Progress.

Wrought Iron Philosophically Considered.

Dr. Aaderson, in his lectare nn "Tnols," lately delivered in Manchester, England, eaid:

When we tbink of any sort of material, beyond the working treatment of its mechanical properties, we seem to be in another world. Take, for example, a piece of commou wrought iroa. It seems to us as of tbe sartb earthy; but, if we are closely questioned in ragard to tho reason for its various properties, we find that we scarcely know anything. Tracing it from ths nra through its various atages until it is in ths haads of tbe smitb ie comparatively easy. We know the natural law tbat governs its elasticity, the limit of its elasticity, its ultimate strength, that it can be welded, that it is ductils, and can be drawn ont into a fiac wire, that it is malleable, and can be spread out into a sheet, or worked ronad from tbe sheet into a gohlet, and may be gatherad back again, if by so doing it eervod any useful purpose; hat when we think nf ths marvelous changes which bave taken place amongst its molecules during the operation, we are lost in wonderland.

To many minds, the piece of cold iron seems to be a solid; under tbe pressure of the testing machine, it is sbown to be an nnstable fluid. When tbe smitb bae the misfortune to leave a piece too long in tbe fire, it vanishes; it bas found evil compauions, and gone off nader an assumed name and a new cbaracter. When a piece of iron is broksn and carefully examined undsr a microscope, we can soe tbat it ie composed of fine crystals; hnt these crystals, wo are told, are composed of innumerable molecules, whicb aro not to ho seen by the microscope, beiag smaller tban the human miad can imagine; still, the smitb feels himself under their iafiaeace. In homely words, be speake of the iron being "red-short" or "cold-short," without thinkiag tbat he is on tbe tbreshold of some of the impenetrable secrets of nature. Tbe steel maker can take advantage of tbe molecular propertiss. Witb beat he can push them asuadsr and infuse among them the subtle vapor of carbon, and the iron bscomes steel, highly improved in most of its mecbaaical propsrties, and with an iacrease of strengtb and elasticity. It may be iaferred that each iron molecnlo is a little world in itself, surrounded with a tbin wrapping of inbnite space, no single molecule being in actnal contact witb aay otber molecule. We bave reacbed tbe limit of subdivision, so far as the eagineer dare venture. The investigatiag pbilosopher, however, ventures mucb further with bis speculatioas; be tries vainly to penetrate into tbe supposed nltimate atoms of matter of wbicb tbe molecules are composed, but further we need not follow.

Honesty in Building.

Honesty is, perbaps, more abnsed than that nf any other ethical or intellectual virtue. It is applied as a cloak of ignoraace, as tbe apology for bad manners, or even for worse purposes. The man wbo, without regard to time, place or company, gratifies his vanity in blurting ont his crude not.ons on any possible subject, is too often called an honest fellow. In fact, he is only so ill-bred and so ignorant as to be supposed incapable of deceit. That may be so, or not. We bave known cesss—and no doubt some will recur to the memorise of most of onr readers—in which a man may be held to bave purposely adopted the disguise of incivility, bave lived for years nndsr the title of "Honest Tom Speakforth," and at length, generally too late for haman retribntion, has beeu discovered to have left bsbind him only an unexplained deficit, or sometimes an equally unexplained family of cbildren. Tbe honesty wbicb causes this kind of pitying, or even of affectionate regard, is simply that, so far as it exists at all, of not telliag lies, or ratber of not putting matters in suoh a light as may be most agreeable to tbe sympathies of others. This kind of honesty is sometimes applied to building. A man will declaim agsinst the importance of stucco, and will give you bideoas brick work in place of it. "Honest brick and mortar," he calls it. Bnt he omits to mention two points. One, that tbe imperfections of English stucco are mainly due the very rude and imperfect way in which we treat our lime. Tbose wbo are most familiar with the use made of this material in Italy, from scsgola work to the preparation for fresco painting, will be aware that this is the case. Secondly, while there is a real beauty in brick work, it requires so mnch care in tbe selection of clay, and in tbe making, hurning and laying of bricks to insure it, that noble brick work is almost a lost art in England. Our honest friend, tberefore, only gives the cheapest and and meanest material that comes to hand, and excuses that slovenliness of his work by calling it "honeat."—*The Builder.*

Grinding Mill Picks.—A mill-pick maker advises that in grinding picks, the pressure be not too great, and tbat sufficient water be used so that heatiug, which always injures the temper, be prevented. It ahould be borne in mind tbat cracking picks should not he used for furrowing, and no pick should be used after its edges are worn to blunt. When picks are blunt grind them to a straigbt level, one-eigbth of three-eigbts,

Friction.

Friction amoag solids ie of two kinds, rolliag and sliding, governed by different laws. The laws of tbe friction of journals (wbicb includes botb solid and fluid frictioa), are quite different from tbe laws of friction of solids, as given in text-books. Fluid friction varies with the square of the velocity, is proportionate to ths area of tbs rubbing surfaces, aad probably independent of tbe pressure. A fluid lubricant forms a fluid cushion, separatiag the surfaces more nr less perfectly, according to its viscosity. Tbe same surface lubricated with a given material may, under ligbt pressnres, eeem to be governed by tbs laws of fluid friction, while under beavy pressures, the lubricant being squeezed out from betwcen the solid surfaces, the laws of friction of solids come into play. Tho ratio of frictional resistanco to total pressure from sliding friction varies directly as the pressure. It is independant of ths speed and area of tbe rubbing surfaces.

Tbo laws of solid friotion differ with the character of the ruhbiag surfaces. Tbe friction of fibrous materials is increased by increased extent of surface and time of contact, and is diminishsd by pressure and speed. Witb wnod, metal and stone (within the limit of abrasion), it varies only with the pressure, being indepsndent of the extsnt of surfaoe, contact and velocity. This limit of abrasion is determined hy the hardncss of the softer of tbe two materials. Friction is greatest witb soft materials and least witb hard ones. The friction of lubricated surfaces is detsrmined by tbe lubricant rather than by solids.

With rotating journal, friction is greater wben tbe journals or bearings are not round than when tbey are truly cylindrical; grsater when they are short than when loag; grsater wben thsre is mucb wear than where there is little; greater when the surfaces are not finely finished than when they are of perfect surface; greater when improperly lubricated than wben daly supplied with a fit lubricant; greater at bigh speed and pressure than at slow.

Bsering surface must he given by lengtb rather than by diameter. It is tbe weight per eqnare inob of longitudinal section tbat determines the heating and friction. Bearings cannot rnn cool nnless the minute bigh places on them are either removed or redneed, and tbe low places are filled np witb some sort of ungaent. If the caps of journal hoxes are left too loose tbe journal will wabble, and if screwed down too tight the lubricant will burn out and tbe bearings become ruined.—*Exchange.*

Wire-Drawing.

Wben tbe ductility of a metal is brougbt into play in a certain manner, tbe result is termed wire. The aacient mode of wire-makiag was by bammeriag tbe metal into sbeets, cuttiag tbese into long strips, and bammering tbe strips into wires. Tbe method in use at present possesses the advantage of greater rapidity, and produces much better wire tban that made in the old way. Tbe metal is sbaped into rods by being drawn in a red-bot state between grooved rollers, and these rods are reduced to wire by being drawn in a cold state tbroagb boles in a plate of some harder metal. Rods for wire are nsually about an eigbth of an inch in thicknsss, tbe wire-drawer prodncing tbe subsequent reduction. Tbe draw-platss are of bard steel, and are perforated with boles varyiag by very sligbt degrees in circumference. Tbese perforations are made with the greatest csre and are usually round. The wire rods are drawn tbrougb tbem all in succession, begining witb those of tbe largest diameter, thus reducing tbem in thickness by slow degrees. The force required to draw the rods through is effected by means of a draw-hsacb, drawing-block, revolving sbaft, bevel wbeels, forceps, and toothed rack. Frequent aancalings are required, for the reason tbat tbe wire becomes very much hardened hy tbe compression. The coating of oxide, occasioned by tbe annealiag is removed by a pickling in dilute acid. Frequently a lubrication of the parts becomes necessary, to permit tbe passage of tbe wire througb tbe perforations of the plate. Wire is commonly made round, hnt it is also drawn in oval, square, half-round and angnlsr shapes. Some or tbe finer and more delicate sorts of wire, for iastance, tbat for tbe pendulum springs in chronometers, are drawn through perforations in ruby, the nsual material for plates, steel, not being of sufficient hardness for tbe purpose. Some of the finest work of tbis kind, made snd used in the mechanic arts is seen in tbe ganze for safety lamps, whicb frequently has 120 wires each way (making 14,400 meshes) to tbe square inch.

Still Inventing.—Mr. Edison bas been working lately to get more light out of a horse power than hitberto, and now gets 12 16-candle lamps per horse power of his ateam engine. He bas also perfected a device for stage effects, by whicb tbe light can he raised from the faintest glow to foll power by degrees. Since June 1st he has filed 51 applications for patents npon electric-lighting devices, and bas recently received 28 patents, making 109 in all upon bis system of electric lighting.

Iron Production.—Of the 936 furnaces in Great Britain, 570 were in blast on the 30th of June and 366 were out of blast. At tbe same date tbere were 434 furnacea in blast in tbe United States and 307 were out of blast.

Scientific Progress.

Tracing the Soul.

Singular Experiments that go to Prove Remarkable Things.

Tbe Berlin *Gegenwart*, of November 15, 1879, contains a report of some experimeats made by Dunstmaier to test tbe accuracy of Jager's tbeory, that tbe sonl of every man and animal is to be sought for in the characteristio odor exhaled in each case. Dnastmaier, who unites in his own person the physiologist and metapbysicias, was, until these experiments convinced him of his error, an outspoken opponent of Jager's views. He is now, however, an enthusiastic convert.

Dnastmaier's method was, no doubt, suggested to him by his familiarity with experimental science. He considered that ligbt and the soul—if the sonl is the odor—are both radiated, and tbat light can be, as it were, collected and fixed hy a pbotographic plate coated witb iodide of silver. What body, now, is as sensitive to odors as iodide of silver is to light? Evidently the nerves of smell in a dog. In tbe center of tbe laboratory a cege containing 20 hares was placed, and a dog was admitted to tbe room. He at once made violent efforts to get at tbe heres, wbiob, of course, in tbeir terror, rnshsd to and fro in the cage. After two bonrs of tbis torture, the dog was killed, tbe nerves of smell and tbe mucous membraae of the nose removed and rubbed up in a mortar with glycerine and water. The 20 bares bad bsen exhaling their sonls for two bours, and tbe dog, during all bis panting and sniffiag, inhaling them for the same length of time. The glycerine might be expected then, to contain a certain quantity of tbe soul of tbe hare, the msin cbaracteristic of wbicb is, of conrse, timidity. Tbat tbis was the fact, tbe followiag experiments seemed to prove: A few drops of the extract were administered to a cat; she raa away from some mice instead of pouncing upon them. By the subcutaneous injection of only two cnbic centimeters, a large mastiff was rendered so cowardly that be slunk away from the cat. By a similar experiment, in which, bowever, a young lion in a meaagerie played the part of tbe hare, Dunstmaier succeeded in isolating tbe soul-substance of courage and in transmitting it to otber animals. Still more interesting experiments showed clearly tbat tbese "psychotype" glycerine extracts had a decided effect on the buman species. Tbus, after swallowing a small dose of psycbotypic timidity, Dunstmaier had not tbe courage to believe in his own great discovery. Tbis effsct soon passed off, however.—*London Medical Record.*

Recent Progress in Telephony.

Some important telepbone results bave been lately obtained by Van Rysselberghe, the Belgian meteorologist, wbose very ingenioas meteorograph wss shown at tbe Paris exhibition last ysar. He bas succeeded in eliminating from telephonic communication tbrougb a wire, the inductive action of a neigbboring telegraph wire (wbich gives a crackling kind of noise in the telepbone). Moreover, we can employ tbe same wire at the same time for both telephonic and telegrapbic work. Thns, in a recent experiment, a mssssge was sent from Brussels by tbe Morse telegraph to tbe directing engineer of telegraphs in Paris, and an oral message sent by telepbone was distinctly hesrd while tbe Morse receiver was in action. At tbe fortbcoming exbibition in Muniob, telepbony is to be tried between tbat town and Dresden, a distance of about 343 miles. American accounts report expsriments in progress as to wbat may and what may not be done in telepbony on underground wires; a cable for tbe purpose having been laid by tbe American Bell Telephone Compeny along tbe Boston and Providence railroad. Tbere are twenty-one rnbber-covered copper wires within a lead pipe, ten of tbese being also covered witb tin-foil to carry off extraneous induction currents, while 10 are twisted together, tbe 21st wire is covered witb cotton aud psraffined.

A Frencb naval committee bas lately reported on the nse of the telepbone in diving operations. Tbe transmitter approved as best is a small flat circular telepbone, having interiorly two spiral magnets superposed. The Gaiffe telepbone as receiver gives good effects. A comparison was also made with the ordinary speaking trumpet, which proves inferior to tbe telepbone, especially as the deptb increases, owing to the effects of pressnre on the membrane in the case of tbe trnmpet. Various modifications of tbe telepbone appear from time to time; one of tbose is Bottcher's telephone, tbe peculiarity of wbich is tbat the magnet, instead of being fixed in the case, is suspended hy steel wires, so that it can, to some extent, partioipate in the vibrations of the membrane, hnt in opposite directions; tbe magnetic variations are thus increased, and stronger induction currents produced in the coil.

A Novel Flute.—A flutelea flatist is spoken of in Havre, as performing wonderful things. He makes a flute out of his left hand, wbich be bolds to his moutb, using the rigbt in lien of stops. The notes he prodnces are not to be distingnished from tbose of the real instrument. His name is Fereyra.

The Progress of Civilization.

Tbe onward progress of civilization brings out these two poiats most conspicuously: 1. The world is getting too small for tbe material and scientific appliances of mankind. 2. History, science, art, etc., are getting too largo for human capacity, meaning tbereby for the general study nf an individaal. All who have lived in tbe country as cbildren, can recollect how small was the area familiar to them; how great was tbe awe witb whicb they ventured ontside tbe precincts, and bow their minds were exercised with the consideration of how boundless were the forests, wildernesses and spaces beyond. When they grew to manhood, tbe little space became contemptible. The area was enlarged to the national boundaries, traversed at railway and steamboat speed. So it bas been with the world and the race. In olden daye aations ventured bat little beyond tbeir limits. Travelers crawled over a few hundred miles along a path beset witb dangers and difficulties, to return and boast of what they bad done. To tbe mind of tbe people, tbe world was a limited space intersected by great and storm-tossed oceens. Now, tbat tbe world can be traversed in a few weeks, and a message can be sent round it in a few minutes. Even tbe sun has become but a slow coacb. Tbe storm-tossed oceans were our best bigbways, but they have given place in the race of competition to the land transit; and soon a trip into central Asia will be but tbe excursion of a few days. The impression of tbe globe now conveyed is tbat of littleness, a growing feeliag of confinement and want of space—for after all, what now ie 24,000 miles, aad tbat is its utmost girtb? If invention continues, tbis conquest of matter by mind, the fseliag caanot fail to increase and to become more generally entertained.

On the other band, history is beating the capscity of tbe human mind to acquire and retain facts. As civilization progresses, events of importsnce come tbickly npon us. Every year piles tbem np, till the task Buckle set bimself —to write the bistory of civilizstion—will become an impossibility for one man to achieve, and, wben writtea, will take tbe lifetime of another to read. Great wars bave tbeir record of strategy, battles and names. Great political obanges bave their record of parliamentary or monsrcbial disputes, progress and triumphs, bringing forward otber lists of names. Religious movemsnts bave their record of converting, proselyting, persecution and martyrdom. Tbe struggle of freedom against oppression, of conservatism against innovation, never for a moment ceases; waning in one place, only to burn up more fiercely in anotber. Colonizstion bas its tale; literature is filliag up lists of authors, of wbom it will soon be impossible for memory to kesp a record. Esch great industry has its own story, and tbose wbo are fully conversaat witb tbe detail of the progress can have studied little else. The offshoot of one branch of scieace is now becoming enougb, if not too mucb, for one professional man, aad tbe tendency is toward taking up specialties. Tbus, we find tbe accumulation of knowledge so rapidly increasing in the world that an admirable Crichton bas become an impossibility, and the acquirement of all has got beyond human intellect, while tbe limits of tbe globe itself are becoming narrowed into comparative insignificance.

As our mind grows big, and tbe world grows small, the capacity to grasp the creation increases, thongh this can never be anything to us but a fatbomless well. That tbe earth should be but a dot in tbe beavens wbirling round the sua, was incredible to people of tbe middle ages, while to us it appears bnt a small estate. To them it was so vast tbat they could not comprehend its insignificsnce in the universe; to us, as it begins to appear insignificant, we can comprebend its insignificance in creation. All tbis sbows tbat the mind of man is enlarging; tbat tbe food on whicb it feeds is multiplying; and while tbat food, notwitbstanding tbe greater mental comprebensiveness, bas grown in bulk, to an extent not to he grasped, tbe globe itself decreases in bulk to tbe enlarged capaoity, to an extent whicb is beginning to make it appear small.

Ocean Telephone.—An interesting telephonic experiment was recently made between Brussels and Dover. A submarine cable is practically a condenser, wbicb, by its inductive action, materially interferes witb tbe speed of signaling. It was feared tbat tbis condensation would prove for a long while a great difficulty in the case of telephonic currents, so transforming tbem as to render tbem unintelligible. Tbe difficulty, bowever, bas been overcome, tbe bonor of the achievement belonging to a distinguisbed Belgisn physiciat, M. Van Rysselbergbe. On the 9th of June tbe new telepbonic apparatus, designed for tbe purpose of counteracting the effects of induction on air lines and condensation in submarine cables, was tried with snccess. Conversation was freely exchanged througb tbe 60 miles of cable and 200 miles of air line. The experiment is very hopeful for ocean telepbony. It may be remarked in this conneotion that tbe telegraph is seldom used between Denver, Colorado, and the mountain towns anywhere from 20 to 60 miles distant. Nearly all tbe business is done by telepbone. When the weather is fair and tbe atmosphere clear and dry, persons 60 miles distant can talk as readily as though they were in tbe same block.

Bullion Shipments.

We quote shipments since our last, and shall be pleased to receive further reports:

Hanauer, Sept. 12th, $4 360: Horn Silver, 12th, $12,500; Ontario (for August), $223 000; Hanauer, Sept. 13th, $2,060; Stormont, 13th, $3,350; Horn Silver, 13th, $7,500; Stewart, 13th, $4,000; Hanauer, 15th, $2,100; Germania, 15th, $6 020; Horn Silver, 15th, $7 500; Frisco, 15th, $8 799; Bullionville, 15th, $1,765; Horn Silver, 16th, $10,000; Horn Silver, 17th, $5,000.

THE *Times* says it is understood the British Consul-General at Alexandria has been directed to inform the Khedive that no capital sentence passed on the Egyptian leaders must be carried out without the consent of Great Britain. Steps have been taken to obtain the services of a competent English barrister to defend Arabi Pasha and other leaders in the revolt.

Mining Share Market.

Although the mining share market was not very active during the first part of the week, at the close there was a decided advance in prices and volume of business. Just now when money is plenty from the sale of crops, it is customary for mining stocks to take an upward turn. The Bodie group has had a "black eye" in the reduction in the dividends of the Standard.

At the north end mines on the Comstock, operations are now principally being conducted on the 2900 level. These are of such a nature that they will in due time drain ont the ground above, on the 2700 and 2800 levels. Meantime, in order to cut down expenses, most of the miners who have been at work on the 2700 level have been laid off. All the ore that will pay for extraction has been mined on the 2600 level of the Union Consolidated. Below the ore stopes of said level the ore vein was found to split up into small streaks, the ramifications of which it would not pay to follow.

The field of operations at the north end is now the 2900 level. Drifting and cross-cutting are being vigorously pushed at several points on this level and in ground showing much more quartz than was found on the 2700 level.

The joint Mexican and Ophir winze is now within 14 ft. of the 3000 level. Here we shall soon be able to ascertain something in regard to the nature of the lode at this great depth. Thus far the ground continues dry. The stratification has become almost vertical, which is a favorable indication, and which also gives assurance that the ground will continue dry to a much greater depth.

At the Chollor-Norcross-Savage shaft they are making excellent progress in the main west drift on the 2600 level. The completion of this drift to the vein will be the signal for the renewal of active operations in the Chollar, Potosi, Savage and all the middle mines.

At Gold Hill a great deal of low-grade ore is being extracted from the lower levels, and in the Kentuck a body of very fine ore of the old-time kind has been developed.

"THE BUCKLAND MANUFACTURER" is the title of a little paper printed in Tulare city, California, hy G. G. Buckland, manufacturer of the Buckland Patent Buggy. An edition of 5,000 copies is printed every three months, and circulated among blacksmiths, wheelwrights, carriage makers, etc. The publisher intends to make it a journal specially devoted to the interest of carriage makers, and next year will probably issue it as a monthly.

A VAST prairie fire is raging in the western part of Nebraska, the tableland between the Platte and the Republican rivers being dried up, with disastrous effects to hay and grass. No loss of life is reported there, though two men were fatally burned some days ago north of the Platte. There are heavy cattle ranges in the devastated section, and unless rain comes, great loss will follow.

DEER, elk, mountain sheep and goats are reported plentiful near Boise Barracks, Idaho Territory. Grouse shooting has been unusually good during the season. Large game, especially cinamon bears and cougars, can be met within a few miles from the barracks.

The Advantages of Two Eyes.

In response to the question, "What is the use of having two eyes?" the answer has been given "To have one left if the other is hurt." Much as we may admire the sagacious foresight of this useful physiologist, it will not be found sufficient to rest contented with his ultimatum. He had evidently not tried his skill to find how unexpectedly he would miss the inkstand while endeavoring to dip his pen into it at arm's length, with one eye closed. He had not thought of holding his fingers a few inches in front of his face to find what part of the wall it would hide from each eye in succession, or how differently it would look when regarded from those two points of view separately, how much thicker it would appear when both eyes were open, how readily he could examine three sides of it at once, how much more definitely he could judge its distance, in a word how much more comprehensive was the information given hy two eyes if used at the same moment. Assuming that he knows exactly how to account for the inversion of the retinal image and the erect appearance of the object there pictured, how our visual perceptions are only signs of what we momentarily feel on the retina, signs that generally represent the realities with a fair degree of accuracy, hut may sometimes represent almost anything else on demand, how, if the eyes be healthy, we have no consciousness of possessing any retina at all, hut instantly and unconsciously refer every retinal sensation to some external body whose existence we are obliged to assume, nnless there be special arguments to convince us to the contrary—grantiog all this, our young physiologist has not thought of inquiring how it is that, although two retinal images are produced, we see hut a single object, and this despite the fact that, like photographs of the same body simultaneously taken from different standpoints, these two images are necessarily dissimilar.—*Popular Science Monthly for May.*

IRON JOINTS FOR COLLIERIES.—At a recent meeting of the Liege Society of Mining Engineers, Mr. Guibal, the inventor of the fan that bears his name, gave a brief account of some joists of special section, which would, at no distant time, displace timber supports in collieries. A shoe having the form of the letter T is placed on the floor of the driving, and receives the uprights of H section, provided with notches, in which fit projectious in the shoe, and also in the longitudinals. To the joists are fitted others of I section, which replace the cross timbers. The system involves no complicated figuring, and is simple to erect. The joists weigh about 30 lbs. to the yard, and are capable of sustaining a load of 15 cwt. in the middle, without deflection. When a working is abandoned, the iron may be taken out, thus having about 50% of the cost. The simplicity of the system has been repeatedly admitted, hnt it is still a question whether it is superior, to any great extent, to the ordinary timber, taking into account the cost of erection, maintainance and sale of the old iron.

THE Russian Minister of Education finds the experiment of giving elementary instruction in medicine in the municipal schools of the capital answers so well that he has authorized its extension

MINING SUMMARY.

The following is mostly condensed from journals published in the interior, in proximity to the mines mentioned.

CALIFORNIA.

AMADOR.

WATER.—*Cor. Amador Dispatch*, Sept. 16: The numerous breaks in the Amador canal within the past few weeks have seriously inconvenienced the Mahoney Co., whose pumping machinery is run by water power. Up to the present time, Thursday, there has been no ore hoisted at the mine this week, on account of the water in the lower levels having risen when the pump was stopped. Everything will probably be running in full blast by the last of the week.

CALAVERAS.

NOTES.—*Mountain Echo*, Sept. 13: The new mill on the Gold Cliff will be in operation in a few days.....We learn that Mr. Patch, who is mining near Smith's Flat, uncovered quite a large deposit of gold a few days ago.....Recent developments indicate that a rich mine has been struck a short distance west of the Gold Cliff. We saw some very fine prospects from that section.....We were shown some rich specimens of quartz last week by a gentleman named Gamblin, whose mine is located near Judge Carley's place, on French gulch.....Thomas L. Lindsay & Co. are still engaged in working their mine near this town. The tunnel is now into the hill over 200 ft, and it will be necessary to run it 40 or 50 ft farther before tapping the main works. The prospects of the mine are increasing daily.....Flattering accounts of the richness of the Coulter mine are coming in daily. The rebellious ores, which have hitherto been the utmost efforts of mining experts, are now being successfully worked by Mr. Hatbeck's new process, the latter gentleman being employed as superintendent of the mine.

INYO.

LOOKOUT.—Inyo *Independent*, Sept. 16: Fitzgerald is working 10 men on the Modock, and wants more. A rich body of ore was struck in the mine last Sunday. Quite a quantity has been taken ont already with more in sight. A visit will be made in a short time.

KEARSARGE DISTRICT.—The Pioneer mill boys have completed their contract for sinking the 50-ft shaft in the Kearsarge tunnel, and we hear that the bottom shows a fine ledge of good ore. The battery of the mill has been put in order for crushing, and will begin operations on a lot of ore from Pat. Chuton's mine.

THE 73.—Sub is the name of one of the finest looking mines we have seen in the county for years. It is situated on the east side of Cottonwood creek, Deep Springs district, and belongs to Berry, Greenly and Broder, being actively developed by the last-named gentleman. Greenly and Scott propose putting up a 5-stamp mill of their own, to work free ores from this mine, tne Gold Coin, and others in the immediate vicinity.

THE MONTEZUMA.—Mr. S. D. Woodhull returned from Big Pine last Wednesday. With Supt. Griswold he selected a site for a new furnace. It is about 1½ miles above the mine, near Slippery Rock spring. The grade from below the mine to the furnace site is nearly level, with little or no expense on road account. The spring runs 2 full miners' inches of good water. Mr. Woodhnll says the mine looks like a small mountain of ore. The furnace at Darwin has been taken down for shipment, and the teams are loading now. Mr. Griswold has let contracts for coal, wood and lumber already, and the whole outlook is immensely favorable.

PARAMINT.—Through breakage of freight wagons and accidents and delays to the pack train, the new castings and machinery for the Inyo Con. Co.'s big mill at Surprise canyon were not completed until the 10th. The mill was to start up the following day, in perfect shape. The company has expended nearly $5,000 in this work, and has now as complete reduction works as can be found in the State. The mines have developed so well that, with the 500 tons of ore now out, Supt. Pheby thinks he can run over 1,000 tons—the best ever made in the camp.

MARIPOSA.

MT. GAINES.—*Herald*, Sept. 16: A. G. Black, of Hornitos section, was in town on Tuesday and Wednesday, this week. From him we learn that a rich strike has been made in the Mt. Gaines mine. After long and diligent delving into the lower regions of that shaft, at last a rich—very rich—vein of ore has been struck, and in the near future we may look for something startling from this quarter. It has always had the reputation of being a good mine, and now promises to turn out to be one of the best in the county. The mine is owned by M. Hulings, Oil City, Penn.

MONO.

BODIE.—*Free Press*, Sept. 16: The reduction in the amount of the Standard dividend has had a somewhat depressing effect on Bodie mining interests—an effect which, however, we hope is but temporary. The rich ore reserves in the south end of the mine have been drawn on so long that they give signs of exhaustion. There is still a vast amount of ore of lower grade in the middle and north end of the mine, and the 1,000 level is looking better than heretofore. The Bodie, as was noted last week, has cut the same hut rich vein in the west crosscut from the 730 north drift, directly under winze No 17. An upraise, to connect with that winze, is now up 15 ft, in 6 inches of rich ore. The Oro has about 8 inches of very rich ore in a vein over 2 ft wide in the bottom of the winze, 33 ft below the bottom of the 714 level. The vein has shown continued improvement as this winze has been advanced. There are rumors of strikes in other parts of the district. The mills are running steadily, and the bullion shipments average about as usual.

BODIE COS.—During the week ending the 14th inst., 277 carloads of ore were hoisted, of which 87 cars were from the 5th level, and 220 cars were from the workings between the 640 and the 730 levels. There were 142.02 tons of ore sent to the mill, and 115.364 tons were crushed. The average value of the ore milled was $74.26 per ton; that of the tailings was $10.12 per ton.

ORO.—The winze below the 714 level has been extended 10 ft during the past week; total depth, 33 ft. The ore vein continues to look well, the pay streak gradually widening as depth is gained, being now about 8 inches wide. The ledge is 2 to 2½ ft in width. During the week some rich ore has been extracted daily. There are indications of this ore chimney dipping south within the vein, instead of north, as heretofore experienced with other ore chimneys. There is about 30 tons of milling ore now in the bin.

STANDARD COS.—During the week ending Sept. 18th, there were extracted and shipped to the mill 1,449 tons of ore; crude bullion received, 2 140 ounces, and the amount shipped to the company is $17,703.13. The east crosscut, 1000 level, is in 295 ft; progress since last report, 10 ft, the rock continuing hard. The east crosscut, 1000 level, is in 245 ft; progress, 12 ft. There is no change to note at this point. The south drift from this crosscut has been advanced 15 ft; total length, 485 ft.

BODIE TUNNEL.—All the ore now being extracted from the mine is being taken north of the tunnel. Ledges No. 20 and 21 show good bodies of ore, from 2 to 2½ ft of ore.

NEVADA.

ALONG THE PROVIDENCE LODE.—*Transcript*, Sept. 15: The Chapman (or Campbell) mine has been worked in a small way for several years, about 2,000 tons of ore being extracted above water level. Some of this has paid as high as $35, and none of it less than $12.50, exclusive of sulphurets. The average has been about $20 a ton. There is a tunnel now in about 400 ft. The head of this tunnel is in a strong 5-ft vein. The walls have many of the characteristics observable in the south end mines, which include the Providence and Merrifield. The pay chute here is some 300 ft long. There being a series of veins in the mine, it is difficult to determine just how many of them will be developed with depth, 2 parallel ones having been

opened on previous to this time. At a distance in of 325 ft a winze has been sunk to a depth of 50 ft, and from this, drifts have been run back to the ledge, which is 6 ft wide 20 ft below the tunnel, where it was worked for 100 ft in length, a large body of ore being left there in going down. The hanging wall is granite, the foot wall slate. They carry a good gouge, but are soft at the depth explored. It is estimated that the chute at head of the tunnel will produce enough ore above the tunnel to keep the new 10-stamp mill, which will be in operation next week, running for several months. The gold from this mine is worth $17.30 an ounce, and $20 in silver is realized to the 100 ozs in gold. There is a neat blacksmith shop at the mouth of the tunnel, and some distance below stands the mill, which is run by water power. The under ground work that is being done now is for the purpose of determining the best place to erect hoisting works. The property is owned by a company of Virginia City capitalists, and is under the general superintendence of Mr Gregory, late of the Comstock. Work is being pushed with energy and in an economical manner. From all appearances, there is good judgment manifested in the development of this property. This bids fair to become one of the big mines of the district, and by another year will doubtless give employment in a large force of men.

MULLAN & WALLING.—This claim adjoins the Chapman and Nevada City on the east, and is nearly 3,000 ft in length. The ledge is now being worked by an open cut and a shaft. The vein is about 3 ft wide and prospects well. The claim was worked several years ago by Allbright and others, to the depth of 50 ft, some of the ore paying as high as $80 a ton. They were compelled to quit operations for the want of the necessary funds to erect machinery. It will be opened as rapidly as possible by the present owners (Messrs. Walling & Muller, of this city), who are certain to realize good results, as the present splendid indications are unmistakable. The Providence lode has its signs, and they never fail.

THE CHAPMAN MINE.—*Transcript*, Sept. 16: The new mill at the Chapman mine (not the Campbell mine, as stated yesterday) will probably begin crushing Monday. The Virginia City company, who have the property leased from Dr. Chapman for a period of 2 years, with the privilege of purchase during that time, will increase the force of employes as fast as the ground is opened to give them room to work.

CONTRACT LET.—*Tidings*, Sept. 16: Mr. George Murphy has let a contract for sinking the shaft on the ledge contracted for by the Robinson Bros., of Robinson's circus. The shaft will be put down to the depth of 100 ft, and then it is the intention to drift. The ledge runs east and west, and dips toward the north. The ground is easy working, and it will take but a short time to put down the shaft. The ledge is something over 3 ft in width, and contains a large quantity of iron. It assays very well, and if appearances justify the further development after the shaft has been sunk 100 ft, Mr. Murphy has instructions from C. M. Robinson to proceed with the work, and he will furnish the coin. The mine will be called the "Mascott."

PLUMAS.

ARCADIAN MINE.—Greenville *Bulletin*, Sept. 18: The general revival of mining business is the reopening of mines that had been prospected and neglected years ago. Among others, the Arcadian is about to be fully opened up and thoroughly worked. This mine was respected as much as 15 years ago by that prince of prospectors, Henry C. Bidwell, and there can be little doubt that, if his life had been spared, this and many other now neglected mines would be in prosperous operation. Some years ago the property came into the possession of the McIntyres. Three years ago these gentlemen had 1,500 tons of ore taken out and hauled to the Cherokee mill, where it was worked. The results of this test were entirely satisfactory, but from various causes—the fire that burned the town among them—work was again suspended, and nothing more was done till the present summer. A few months ago work was resumed in the mine, and such further developments made that the proprietors have now a mill well under way. An ore house is already built since this work began; the mill building is being pushed ahead as rapidly as possible; the castings and machine work are well advanced at the Greenville iron Works, and in a few weeks the new mill will be in full operation.

SOUTHERN EUREKA MINE.—The mill of the Southern Eureka mine was started up on Monday morning. Upon the results of the present experiment will depend the future history of the mine.

PLUMAS CON.—The tunnels are now all cleared out, the timbers fully repaired, and crosscuts will be started at once.

CRESCENT MINE RELOCATED.—The Crescent mine has now lain idle nearly five years. It was owned by the McDonalds, of San Francisco. No work has been done in a long time, and as there was no patent ever obtained for it, and the annual assessment work has not been done, it is now claimed that the title of the former owners is void. Acting on this ground, last week, Thomas Davis relocated the claim, and has gone to work on it. Near the mill, he is now opening a ledge, from which some very rich rock is obtained. Pieces of this picked up from the dump show up a surprising amount of gold. Last week, Mr. Davis was offered a handsome sum by a well-known mining man here to relinquish his claim, but refused it. This mine, in former years, produced the richest ore that has yet been found in the district.

SAN BERNARDINO.

CALICO DISTRICT.—Los Angeles *Mirror*, Sept. 6: Mr. E. E. Vincent, from that wonder of the nineteenth century, Camp California, editor of the *Calico Print*, now in this city, has with him a few specimens of ore from different mines in that place which make a most wonderful showing. Some of them dazzle the eye and would turn the head of any prospector by their exceeding richness. He has also a quantity of nuggets of born silver taken from the mines, which are all but pure as the refiner can make them. Other specimens are so rich in silver and so free from grit or other substances that they can be whittled with a knife without damaging the edge. Others, aside from the wealth of silver they contain, are gorgeous in vivid colors and make a handsome showing as cabinet specimens. The camp, which was almost deserted for a time on account of heat and sickness, is again alive with business, the heat and sickness alike having disappeared. Mr. Vincent, with wife and partner Mr. Overshiser, never left their post, however, and were not inconvenienced to any great extent by the heat, nor had they any trouble with disease. The weather is now pleasant and agreeable, and work has been resumed on nearly all the claims which were abandoned. Many rich strikes are a result of the resumption, notable among which are those of the Snow Bird, St. George, Bell Key and others.....The Snow Bird is about two miles from the camp in a series of small hills, which are evidently solid mineral deposits, and owned by Messrs. Taggart & Joiner, of Azusa, this county, and some exceedingly rich ore has been discovered, assaying away up in the thousands.....The St. George is owned by Richard Hooper, B. Weuderlin and others; is a late discovery and develops a mass of very rich ore. It is in the vicinity of the Occidental mine.

NOTES.—Prescott *Courier*: New ledges recently discovered near Camp Wood, some 45 miles west of Prescott, carry gold, silver and copper in paying quantities. Our fellow-townsman, John Hartin, is interested in one or more of them. Water, timber, everything necessary, are plentiful. Assays made by Mr. E. Sthal are encouraging. H. Leroy is the discoverer of these mines.

Mr. Egbert and a party of Eastern gentlemen are over in Hueasyampa district examining mines.

Gov. Tritle and Mr. Thomas are in Black Hills district looking at mines.

Harry Ashton, a noted prospector and miner, reports great activity in Turkey Creek district.

Josiah Dils, of Peck district, informs us that the Occident mine has a fair sized body of very rich silver ore. It is expected that the 100 foot level of the Peck will be free of water in about two weeks.

SIERRA.

RICH NUGGET.—Grass Valley *Union*, Sept. 16: Recently a beautiful gold nugget, weighing 100 ozs, was picked up in the breaste of the Union Gravel M. Co., at Gibsonville, Sierra county. The next day, another, of 50 ozs, was found in the prospecting dump. This company has its dumpe nearly filled with rich pay gravel, and as soon as the water season comes, will realize one of the largest clean-ups ever had in that promising region of the Sierra Nevadas.

BONKER HILL.—*Mountain Messenger*, Sept. 16: The Bunker Hill claim, located at Little Grizzly, on the ridge between Canyon creek and the North Fork, has always been a good mine, but lately it is proving better than ever before. Some time ago, the company had a cave in its tunnel, and was compelled to run around it. It has now just completed that job, and the first gravel it took out paid 4 ozs to 6 carloads of gravel, which is equal to more than $10 to the load. The cost of getting out gravel is probably about $1 per load—perhaps not quite so much. The company has a very valuable claim, and it is the opinion of experts that it really only just got into the main channel.

A COMPANY at Minnesota is running a tunnel into the ridge between that place and Chips Flat, to tap a gravel channel supposed to be there. At last accounts, it had encountered a heavy quartz wash, and felt confident it was inside the rim of the channel.

NEVADA.

WASHOE DISTRICT.

CALIFORNIA.—*Enterprise*, Sept. 17: On the 2700 level the Joint Con. Virginia southeast drift has been advanced 17 ft. Are extracting ore from the old croppings.

SIERRA NEVADA.—Drill hole No. 1 from No. 2 winze, 2700 level, extended 220 ft. North lateral drift, on the same, extended 24 ft.

OPHIR.—During the week 219 tons of ore were extracted from the croppings, and bullion of the value of $15,059.72 shipped below.

UNION CON.—The south drift on the 2900 level was advanced 25 ft. During the week 44 tons of ore was extracted on the 2600 level.

MEXICAN.—South drift No. 2, on the 2700 level, has been extended 45 ft and connected with the crosscut.

CHOLLAR.—The Chollar drift west from the Chollar-Norcross-Savage shaft on the 2600 level was started on Monday last, and at noon to-day (Saturday) is in 100 ft from shaft. The ground in the face is very hard and perfectly free from water.

YELLOW JACKET.—During the past week the water has risen 12 inches, standing to-day about 1,148 ft above the 3,000 station. At the second station, or 300 level, they are engaged in breasting ore and running a drift west to connect with the old stopes. They are taking some ore from the third station, or 400 level; also from the fifth station, or 600 level, they are getting ore from the winze sunk north of the old workings. On the 12th inst. they commenced shipping their accumulated ore to the Brunswick mill, and are daily shipping about 40 tons.

SUTRO TUNNEL.—North lateral repairs—Three repairmen have been employed since last report cleaning out loose rock and relagging near the Mint connecting; also, put up one set and three center posts. South lateral drain—Since last report the sub-drain has been extended 3604 ft, and 25 ft of the drain below point 3,595 cleaned out; also, replaced the drain boxes, which were temporarily removed for convenience in retimbering. South lateral repairs—Having finished work on sub-drain, etc., most of the repair shift commenced yesterday to retimber and repair in the south lateral between point 3,800 and intersection of main tunnel. They have put up three sets of new timbers and one center post. Prospect Drift No. 6—Number of feet last report, 203; driven since, 27; total, 230 ft. There has been no material change in the ground passed through during the week. Two repairmen are employed back of the face timbering and cutting up small sub drain for seepage water. The flow of water from the tunnel is 4,650,139 gallons per 24 hours.

COLUMBUS DISTRICT.

NORTHERN BELLE.—*True Fissure*, Sept. 16: The main drift on the fifth shaft level has been advanced 12 ft during the week; the entire face having passed into softer ground, the formation being decomposed quartz. The crosscut from the main drift, on the third shaft level, shows the same hard rock as last reported, and is in a total distance of 43 ft. In the upraise from the first shaft level there is a very decided and encouraging development. A week since there was about a foot of ore at this point. It has since widened to 4 ft, and is of excellent grade. This discovery is considered a very important one, as the country above, nearly to the adit level, is almost entirely unprospected, and as soon as possible stoping will be commenced on this new ore body. The stopes on the 8th and 5th levels show no dimunition either in quality or quantity of the ore produced. The daily output of ore has been about 03 tons. The total shipment of bullion for the week ending Sept. 15th, was $16,855; total shipment on September account, $27,397.97.

MOUNT DIABLO.—The winze started near the bottom of winze No. 2 shows a foot of $55-ore, and the east drift from winze No. 4 is in 61 ft, and has shown small hunches of chloride, assaying from $60 to $100 per ton. The raise nearly north of the shaft on the second level has connected with the east drift below the first level. The east drift is being driven ahead, and shows bunches of $70-ore in the face.

GENERAL JACKSON.—The east drift from the whim shaft has advanced 11 ft during the week. It is now in 50 ft, and shows a strong ledge formation, with low-grade manganese ore.

COLUMBUS CON.—The drifts being run between the two shafts, for securing ventilation, are progressing finely. The face of each drift is in a favorable formation, which shows streake and bunchee of ore.

JACKRABBIT DISTRICT.

CONTRACT TO LET.—*Pioche Record*, Sept. 16: A contract to sink and timber 100 ft of the shaft of the Payday mine, Jackrabbit district, the company to furnish all material, will be let.

PAYDAY COMPANY.—The following is taken from Supt. Hook's letter: 'The progress made in the shaft last week has been very favorable; open fissuree coming in the north side, with spar, and looking kindly. The fissures are making downward as work descends. The ground is breaking well, and work has been pushed as rapidly as the ground would admit, as we were required to stop sinking a short time, so as to put in timbers. We resumed sinking immediately; total depth, 168 ft."

OSCEOLA DISTRICT.

A GOLD LODE FOUND.—Virginia City *Enterprise*, Sept. 17: It has for years been known that at Osceola are rich and extensive placer mines. Although there has been but a very small and uncertain amount of water with which to work the placere, yet o few miners have stuck by the diggings and have made them pay right along, and at times very large nuggets of gold have been found. Being in a region where there was no great and incompressible wash and system of old and new river channels, as in the placer mines of California, it has all along been plain to mining men that the gold found in the placer mines of Osceola came from some very rich quartz lode, or series of lodes, in the immediate vicinity. The gold also showed thie, much quartz adhering to it. It has always been said that whoever should be lucky enough to find the source of this gold would have in it a big fortune. It now appears certain that the source, or at least one of the sources, of the placer gold has been discovered. The Ward *Reflex* has the following: "William Stephens informs us that Captain Akin uncovered an 8-ft gold quartz ledge in Osceola, 7 weeks ago, that is exceedingly rich He says he has been engaged in gold mining in Australia and California for many years, but never saw anything to equal it. The ore is not spotted, but rich throughouto An assay of what might be called something like an average of the rock went $3,000. Godby & Hampton are part owners in the claim." The same paper says, on the same authority: "Money enough has been raised by Godby & Co. to bring in water to the placer mines of Osceola. This is certainly good news, not only for Osceola, but for White Pine county generally. No enterprise on the coast has a brighter future before it. Competent judges do not hesitate to say that the placers of Osceola cannot be worked out in 10 years. Since the discovery of placere in that camp the largest nuggets on the coast have been unearthed there—the largest being valued at $4,500." The placer mines being so extensive, it is a pretty sure thing that the recently-discovered quartz vein is not the only one that has shed its golden grains and nuggets upon the surrounding flats. It is not unlikely that a still richer, if not larger, velo remains to be discovered.

PEAVINE DISTRICT.

A VERY GOOD PROSPECT.—Reno *Gazette*, Sept. 16: Nine assays just made in San Francisco, of ore from all parts of the Mint mine, averaged $18 per ton. The ore is of a free-milling, gold-bearing quality, and yet of no account whatever in the eyes of the non-believer, all because it is located within 4 miles of Reno and in Peavine district.

SILVER GLANCE DISTRICT.

THE VANTURA MINE.—Reno *Gazette*, Sept. 16: Reports from this mine, located in Red canyon, are most encouraging. The mill is running steadily and making good returns. Other mines in the vicinity are being opened, and good prospects are showing up in various directions. It is fair to supp se that Silver Glance district will, before long, attract considerable attention. The most of the work is being done by Reno men.

SWEETWATER DISTRICT.

IMPROVING.—Virginia City *Enterprise*, Sept. 16: This district appears to be steadily improving. Instead of flattening and fizzling out under the pick and drill, it has bulged and grown. Many good developments have been made there during the past three months. The one little mill of the district has been running steadily, and turning out bullion all summer. The Silverado mine they have just made a strike of 5 ft of ore that will go $600 to the ton. Rich ore has also been found in the Lady Hayes. The Lookout and Great Western are looking exceedingly well, and the North California Comstock, on which considerable work has been done this summer, shows a very large amount of good ore. The Messrs. Summers have been making a good thing of it with their mine and little mill, notwithstanding the cost of transporting the ore on the backs of mules, lawsuits and other trials and tribulations.

ARIZONA.

EMPIRE DISTRICT.—Tombstone *Republican*, Sept. 16: The Total Wreck mill is nearly completed, and is said to be one of the finest on the coast. It is located about 100 yards from the mine, and is so situated that the ore from the dumps will be conducted to the mill in chutes, thus saving the cost of hauling. More than 3,000 tons of ore are now on the dumps awaiting reduction, which will average at least $60 per ton. The mine is in a splendid state of development, and everything is in readiness for stoping to be commenced, which will probably be done as soon as the mill starps up.....The Forty-niner, 3 miles from Total Wreck, is considered one of the valuable properties of the district. It has a 100-ft shaft, all in ore.....The Widow Parker, owned by Hank Wright, has a shaft 60 ft in depth, the ore being of good grade. It is on the Total Wreck ledge, and negotiations for a sale are now pending.....The Wedge and Dividend have been consolidated, and operations on a large scale will soon be commenced. Colonel Zahriskie, Major Toole and Toppy Johnson, of Tucson, are the principal owners.....A large amount of work has been done on Major Morgan's Cross and Crescent, although at present nothing is being done with the property, which is unquestionably of great value.....The town of Total Wreck, which is 9 miles south of Pantano, contains about 150 inhabitants. The town is growing steadily, and as soon as the mill starts up and bullion shipments commence, a genuine "boom" is confidently anticipated.

TOMBSTONE.—*Epitaph*, Sept. 16: The work of development still goes on, and everything wears a cheery aspect. The great producing mines are still turning out ore in large quantities, the mills are running along as usual and everything gives promise of permanency and prosperity. The sinking of the combination shaft by Contention and Grand Central folks will soon take definite shape, and will be continued, doubtless, to a depth of 1,000 ft. This will be the graodest enterprise yet inaugurated in the camp, and will encourage active development in other quarters. The western end of the district still keeps up its boom. The Tuck Sure, Little Devil and Blue Jacket are coming out strong, and give every hope of becoming a great bullion producer at no very distant day.

COLORADO.

VERMILION DISTRICT.—*Register-Call*, Sept. 16: A pool has been formed to work the Mann lode, in Vermilion district, property of B. F. Pease. The stamp mill, owned by the same gentleman, has been leased by the same parties, who have had the engine and boiler repaired. A plant of machinery has been ordered, which will be placed over the deep, or main, working shaft of the Mann lode. The lessees intend making preparations to work the mine during the fall and winter months, and will store their ore until spring, when the stamp mill will be started up.

ROYON AND READY.—We are informed that the Rough and Ready mine, in Fairfield district, is now being worked by Philadelphia capitalists, under bond and lease.

STAMP MILL.—It has become a settled fact that a 15-stamp mill is to be erected in Lump gulch, below the stage crossing of the Rollinsville road. The mill will be run on ore from mines in Central and Independent districts.

DISCOVERY.—A new discovery has been made in Wisconsin district, the float from which, assayed in Idaho Springs, shows a return of 137 ounces in silver per ton. The discoverers have been prospecting for the past 2 months to trace the float to the vein, which they now claim to have done. A load of the ore will be sent to the smelters this week for treatment.

TRUST.—The Trust mining company is taking out the water from the main shaft of the English-Kansas mine, on Quartz hill. It is understood that this property is to be worked actively hereafter.

HASELTINE.—Mr. J. B. Mellor, of the Haseltine mining company, Russell district, will arrive from the East this week, when ac ive working of that mine, through the pump shaft, will be resumed on a much larger scale than heretofore.

CARTER-BANCROFT MILL.—Georgetown *Courier*, Sept. 14: Mr. Carter, proprietor of the Carter-Bancroft mill, at North Empire, came over yesterday with some gold nuggets that weighed nearly 28 ounces, which were the result of treating 863 tons of dump stuff from the Silver Mountain, Badger Boy, Conqueror and Juniata lodes, during the month of August. The average assay value of the ore was about $12 50 per ton, some of it being as low as $5 per ton. The last of this week, or the first of next, J. A. Smith and Frank Hall will come up and superintend the milling of a test lot of heavy pyritic ore from the Pittsburg lode. They will run through not less than 30 tons.

THE SEVEN-THIRTY MINE.—There are at present about 50 men at work in the Seven-thirty mine, Brown gulch, nearly all of whom are on ore. The main shaft has reached a depth of 220 ft below the tunnel level, and the 210 level has been started both east and west. After penetrating the barren zone, the shaft has been in ore for a distance of 30 ft, the ore vein averaging about 1 ft in thickness. The 140 level is being driven east and west, and has good ore in both headings, also in a winze that is being sunk west of the shaft.

THE RED ELEPHANT MINES.—The Bowlder Nest mine is rapidly coming forward again as one of the most important producers in this county. On the 8th level, Laring & Co. lessees, have a vein of solid smelting ore in their back-stope, 22 inches thick, that carries from 150 to 200 ounces of silver to the ton. The level has entered the ore body about 30 ft, and it holds out well as the drift progresses. This is considered one of the finest ore bodies ever opened in the mine. The same party of lessees are also driving the level from the Schwarz shaft, 140 ft below the Clery adit, which shows, at the west heading, a vein of 200-ounce ore about 3 inches wide.

NOTES.—The Pelican & Dives company is working about 100 men, chiefly on the Pelican, Zillah and Unicorn lodes above the 2d tunnel level.....A vein of scattered ore 2 ft wide was struck last week in the Little Jack lode, the western extension of John Turck's Alinda lode, on Independent mountain, in the level that is being driven west from the tunnel.

IDAHO.

WOOD RIVER.—Idaho *World*, Sept 16: Henry Zipf came over the other day from Wood River. He says the day of excitement and rushes has passed, and the country has to depend almost altogether on her own resources Heretofore outside money did a good deel toward keeping up the country. Henry has a prospect between Hailey and Ketchum.

Gooo drift diggings were discovered on Loon creek sometime ago. From 75 cents to $1 50 a pan is obtained on the bedrock. Four or five men have taken to supplies from Bonanza. They will drift there this fall and the coming winter.

THE placer diggings discovered at the mouth of the South Fork of Salmon, two or three months ago, prospects on an average, five cents to the pan. There is quite a rush in there. Don Henderson met a party of forty men a short time ago en route from Vienna to the new diggins.

SHEEP MOUNTAIN.—Don Henderson and Hugo Bayhouse passed through here yesterday on their way to Sheep Mountain. Don has been out their prospecting several weeks, and discovered a couple of very rich veins. He came through to Boise via Wood River a few days ago. Don and one or two others have a galena ledge four miles from Sheep Mountain, which is named the Red Warrior, the assays from which go from $400 to $600 per ton. The Alta Johnson, in which he is interested, is north of the Red Warrior about three quarters of a mile. The ore from it assays from $70 to $80 00 per ton. The character of the ore is black sulphurets and chloride, with a small per cent. of galena. At the surface the vein is 18 inches wide, and at the depth of 14 ft is 28 inches. The Daley Bros. have a fine looking vein a short distance from the Alta Johnson that assays from 600 to 690 ounces, silver, per ton. The chief ledge of that district is one about a mile northwest of Daley's location. It is 5-4 ft wide, all good pay ore. The discovery was made by Emanuel Fontis, John Early has an interest in it. This is the only claim that has been taken on this vein. A good deal of prospecting has been done, hunting for the extension. The vein is covered, making it hard to find. The Dowling boys have located a claim east of Daley's location. The ore is high grade galena.

MONTANA.

NOTES.—*Inter-Mountain*, Sept. 16: The Glengarry King, owned by Hughes & McLair, is one of the most promising prospects in the Summit Valley district. The lead is immediately north of the Alice property. At a depth of 70 ft a 5-ft vein of ore has been uncovered, which will assay as high as any ore encountered in the district.

.....The owners of the Fourth of July lode are sinking on a 2-ft vein of 600 ounce rock.....The Rescue, a location close to the Glengarry, shows an excellent ore body. An interest was purchased in the lead some 6 weeks ago, and the gentleman bought the remaining interests, paying therefor a large price. We have not learned the figures.....At 190 ft west, and 41 ft from the south wall, a 5-ft vein of ore was uncovered in the Modoc last night. Assays will be made to-day of the ore which is thought to be very rich copper-silver.

NEW MEXICO.

THE PERCHE STRIKE.—*Black Range*, Sept. 2: The new strike on the Perche, which is now attracting so much attention, was made by Jack Sheddeu, an experienced prospector, only a few weeks ago was brought to about Fairview and Chloride, ragged and penniless. He went from the range to Eagle, where he hung about awhile, and then drifted into the hills. Previous prospectors on the Perche had looked for iron-capped leads, and these were pretty generally staked, but Jack ran across a spar dyke that nobody seemed to want, and on this he began pounding about with the result which is now known to everybody. The rich bowlder, which attracted so much attention on the outside, gave no signs of the riches found within when it was broken. Mr Sneden showed his ore to D. H. Bentley, who took him he could sell it for him, and the owner offered him a tenth interest if he would get a purchaser. Mr. B. thereupon went to Lake Valley, where he found an agent of Gov Tabor's and Mr. Wurtzebach, and the sale of the two locations, the Solitaire and the St. Clair, for $100,000, was easily consummated, Mr. Bentley retaining his one-tenth. Ten thousand dollars were paid on the bond this week, and men were put to work taking out the ore and piling it up. The discovery is on the south branch of the north fork of the Perche creek, not more than half a mile from the mouth of middle fork. It is high up in the range among the rugged hills and pine timber, about 7 miles from the Bullion mine and 9 miles from Hillsboro, which has been lying for 10 years quietly unconscious of the great wealth to be so easily picked up in its immediate vicinity. The ledge of the St Claire, which is now being cut, shows a rich pay streak of about 6 ft, which is bordered with white spar. The richest specimens run 5000 oz. silver, but the whole ledge will not do it by any means, although it is rich enough for all purposes. The location of this section is about the junction of Socorro, Dona Ana, and Grant counties. Most of the country has been located for more than a year, and the recording has been done in each of the counties named. Since the strike everything in the vicinity has been pumped, and every man who has property there has gone down to protect it

OREGON.

NUGGET.—Jacksonville *Times*, Sept. 16: J. W. Ingram, of Willow Springs, while scratching in a bank of the claim he is interested in, the other day picked up a nugget of gold worth $10.

R. W. DERICKSON & Co. have their mill on Horsehead, Josephine county, almost ready for business, and will commence crushing ore before long. They have excellent prospects in sight.

PIPE—Bilger & Maegly are engaged in putting several hundred feet of hydraulic pipe together for Al X Watts, of Williamsburg, Josephine county. He did quite well last winter, and proposes operating on a larger scale next season.

MILL.—B. W. Dean informe us that Mitchell & Ross have the foundation for their mill under way, and will have everything in readiness by the time it arrives from Roseburg. They have located in the Blackwell district for the present, proposing to test quartz from various ledges in that vicinity.

COPPER.—The latest rumors from Josephine county are to the effect that parties representing Eastern capitalists have purchased the copper mines in the vicinity of Waldo, and that several men are now engaged in prospecting them. It is believed that there is a large deposit of ore that will pay well.

UTAH.

PARK CITY.—*Record*, Sept. 16: In the Wasatch East a small vein of fine ore has been run through. The tunnel is now in nearly 90 ft, most of the way through ledge matter.

THE CITY ROCKS mine, in Little Cottonwood district, is shipping about 75 tons of ore per week to Salt Lake City, the ore averaging $100 per ton. At the mine an ore house and machine shop have just been completed.

THERE is a splendid country to prospect to the south and west of the Lackawaxen. The ledges crop out very strong and give every promise of good mines at no great depth Who'll be the lucky man to open up a rich mine in that locality.

THE MARSAC CO. has received this week 700 ft of rubber hose and 3 No. 1 nozzles, to use in case of fire. This is a valuable addition to the fire defenses of the Park, but we hope there will never be any occasion to use them.

IRON.—An occasional correspondent, writing from Fillmore, says: "Knowing the lively interest you take in the mineral development of Utah, I herewith report to you what I consider the largest iron find in Utah, not excepting the famous iron City mines, so long contended for by the Hon. A. G. Campbell and Bishop Taylor. The mines I have just visited are located in the northern part of Millard county, and within 10 miles of the U. C. R. R. The deposit is about 800 ft wide and can be traced for half a mile. The iron carries both gold and silver, the percentage of iron being 75. Mr. Roof, the owner, is rather jubilant. He says he has the largest mine in Utah, and, like the Horn Silver, is going to have a railroad to it.

The Star Mine.

From the annnal rsport of L. M. Foulke, superintendent of ths Star mins, at Cherry Crsek, Nev., we take the following points:

From August 17, 1881 to August 17, 1882, inclusive, there has heen millsd at the Star mill 7,106 tons, gross weight (no deduction for dryage), of ore, yislding $312,837.48, gross, eqnal to $44.244 per ton, actual result, without allowance for dryage. Average battery assay during ths year wae $50.69 per ton; averags furnace assay, $47.58. There was consumsd at ths mill in making steam, roasting the ors and rstorting the amalgam, dnring the year, 2,778 cords of wood, equal to 231½ cords per month, and a fraction less than eight cords psr diem, of which amonnt about three-eighths was consumsd at the roasting furnace in chloriding the ors, a fraction lsss than five-eighths in genersting steam—a vsry small relative portion having hsen required for rstorting. The avsrage cost of wood on the mill yard—two-thirds pine and one-third mahogany—is $5.75 per cord, equaling $15,973.50 for mill wood. There have heen consumsd during the year 892 tons of salt, at an average cost of $25.10 psr ton, delivered at the mill, from which you will perceive the cost of salt is considerably in excess of the cost of mill wood. the cost of salt consumed having hesn $22.339. The amount of quicksilver used at the mill during the ysar was 12,008 lbs., showing an average actnal loss to the ton of ore worked of 1 13-16 lbs. The total expensss connectsd with ths mill, including wood, salt, quicksilver, labor, castings, chemicals, etc., for the ysar, amountsd to $108,511.28, eqnal to $15.27 per ton millsd. During ths month of Octoher, 1881, we placed vsry heavy, solid stone and brickwork foundations undsr our mill sngine, since which it has run remarkahly smooth and worked well. Our mill boilers are frss from scale and in sxcellent condition.

During Octoher, 1881, we also placed in the mill a new 50-inch roaster, which works well, increasing our chloriding capacity 25%, at very littls, if any, mors cost for fuel than the smaller one of the same make (Howell & Whits's patent). We also havs, during the year, placed in one of the hatteries a heavy 5½-inch Norway iron cam shaft, with heavy cams, and also in hoth hatteries heavier bosses and topits (all ohtained from the Carson foundry), which make our hatteriss much hstter than at this date a ysar ago.

The total expsnses at the mine for ths year wsre $108,623.36; numhsr of tons of ore sxtracted, virtually same as milled, 7,106. Thsre has hesn consumed at the mine, in making steam alone, during the year, 3,009 cords of wood, at a cost of $6 per cord dnring summer months, and $6.50 during wintsr months, up to June 1, 1882, whsn the contract expirsd, at which time I purchased and dslivered at mins 875 cords of wood at $5.50 per cord, and made a contract for ons ysar's supply, from August 15, 1882, to Angust 15, 1883, at $6 psr cord, with a large supply of ssasoned wood always to hs on hand.

Shortly after date of last annual report, the company purchassd and now own their ore tsam, stahle, etc., which can readily hs sold for original cost to-day. We have also built a gradsd road to the month of the tunnsl, ovsr whioh to haul the ore. The actual cost of hauling has hesn nearly 20 csnts psr ton less than the lowest hid for the year was for, and from present prospect of prics of grain and hay, will he still less the coming year, hesides saving the constant annoyance and trouble ws prsviously had at stormy seasons of the year, and when the roads wsrs had. No ssrious accident has occurrsd at either mins or mill during the year. Accompanying hsrswith, you will find inventory of propsrty and statement. Under ths presant sxisting circumstances regarding rates of wages, as established hy ths Miners' Union (of which ths head center is at Virginia City), and there, apparsntly, being no probability of any immediate reduction heing had on the present exorhitant rstes, and our mine being of such a character that it is almost impossihle to opsrate advantagsously under ths contract system, psrmit ms to maks the suggestion, at this time, that it hehooves this company to seriously consider the propriety of making such arrangemsnts in the near future as will enable them to hoard their own hands (giving them good hoard, and charging them a good price for same), as thsre ie, at least, $1,000 per month therein. I would also suggest the propriety of considering, at the same time, the advisability of the company keeping on hand and selling to miners, mill men, wood msn, etc., in their smploy, a stock of pursly staple goods adapted to the use of thess parties, as another means of getting partially rsimhursed on the wages paid. There wonld hs no risk from loss hy had dehts, and there is a considsrahle margin for profit.

Passing Away.—The pioneere of California are fast passing away. The funeral procession winds its way daily through some one of our monntain towne, hearing to their last resting place the remains of an "old timer." We use the term with respect. They were a brave and sturdy race of men, the generation which first upturned the sods above the placer gold, and who plowed the first furrows of civilization upon hillsides where now are the homestead, the school-house and the church. They have done their work. Coming generations will profit hy their industry. The monuments they have reared to themselves have been often the crumbling pile of "tailings" destined to he leveled again by the hand of the farmer; and with the rude emblems of their toil disappears psrhaps the last trace of many a rough but kindly hand. The years will hs hut fsw when the last pioneer shall bs borne to his long home; when the romance of early California life will live only in fiction; when the argonaut of the West shall have become a strong historic character in one of the world's strange episodss. —*Union Democrat.*

The Tombstone and Way up Mines.

This morning at 9 o'clock was heard, before Court Commissioner Drum, ths argument on motion of ths T. M. & M. Co. for an injunction to restrain the Way Up mine from taking out ore pending the decision on motion for a new trial. It will bs rsmsmhsred hy our rsaders that some months sincs suit was institutsd hy the T. M. & M. Co. for possession of the Way Up ground, npon ths plea that the ledge upon the Goodsnough mine, one of the company's propsrties, entsred the Way Up mins npon the dip. Upon the trial, the plaintiff attemptsdto show that the ledge in qusstion consisted in what was called a limestone zone, containing ore in varying quantities, enclosed hetwssn a hanging wall of slats and foot wall of quartzite. This ledge or lode varied in width from 40 to 90 ft. The proof at the time did not sesm to carry out this theory, the ore hody not having heen demonstrated as heing continuous through ths claim. The defsnse provsd at the time hy an overwhelming oloud of experts and minsrs familiar with the ground, that a ledge running at right angles to the Goodenongh could he traced the length of the Westside claim, through the Toughnut and Goodenongh and into ths Way Up, the distance being nearly a half mils. The case was ably contestsd hy hoth parties, the trial occupying about two wesks. A jury had hsen waived, and the case, after some months' delay, dscided hy Judge Stilwell in favor of the Way Up mins, upon the ground that the ledge upon which the Way Up was working was ths ons traced from ths Westside, and not ths dip of any ledge belonging to the Goodenough. Upon rendering of judgment, the plaintiff made motion for a new trial, pending which defsndant entered npon the ground in question and resumed work. The district judge heing absent, the plaintiff, as hsfore stated, appealed to the court commissionsr for an injunction. Judge Haynes appearsd for the plaintiff, the defense heing represents hy Jndgss Lewis and Berry. Ths argumsnt of Judge Haynes consisted principally in the reading of affidavits from Professor Church, ex-forsman Kirk and others, to provs that since the trial, explorations sxtending for over 400 ft. had heen made along the length of the limestone zone, and large hodiss of ore found in different places, all of whicb tended to prove that the zone was a veritable ledge, and not a series of irregular deposits, as claimed hy the defenss, and that the said zone on its dip was that npon which the Way Up was working. Judge Lswis, for the defense, sxplained the salisnt features of the oase to ths commissioner in a clsar and concise statemsnt of the testimony as offsred upon the trial, and still further contsndsd that ths commissioner had no power to review or pass upon the question after judgment had heen rsndered hy ths district conrt.

The argumsnt of Judge Lswis carried conviction with it, and the injunotiou was denied hy the commissioner. This action of the commissioner will insure the continued working of one of the most promising minss in the camp. —*Tombstone Republican.*

Pomegranate Drink.

Any delicatsly flavored fruit juice may be taken as a hasis, hnt that of white currants or grapss is especially to hs prsferred. A sufficisnt quantity of the freshly-exprssssd whits currant, or othsr juice, is first to he raissd quickly to ths boiling point and maintained at 212° Fahr., for thrse or four minutes, after which it shonld he covered ovsr and allowed to cool, after having been diluted with from one to two volumss—according to its strength and degree of acidity—of water previously hoiled. To each quart of this liquid from 6 to 12 pomegranates should he allowed, which must hs carefully dsnnded of thsir onter covering with the aid of a silver or hone knife, as iron in any form should not he allowed to come in contact with this fruit. Placing the fruity portions upon a porcelain colander, or a coarse pisce of canvas, the pectinaceous juics may he rsadily disengaged from the seeds without hrsaking the lattsr, hy means of a fluted wooden "hutterpat," or other snitable utensil, a little water heing psrmitted to drop upon the ssed-mass during the lattsr part of the operation; ths whole of the pomegranate juice thus obtained is then strained and added to the fruit liquor hefore mentioned; about a quart of the cleansed seede and rind are next elightly crushed and hoiled or infnsed for a short time, hard spring water heing employed, hy prefsrence, for thie pnrpose. Simple syrup, sufficient to sweeten the fruit liquor moderately, having heen added to the same, enongh of the rind decoction ie etirred in to impart a distinct, hut not overpowering hitter, flavor to the whole.

This pomegranate drink is an eminently wholesome one, possessing great powers as a tonio and febrifuge, and when properly made, it will keep for daye with all its properties unimpaired.—*Monthly Magazine.*

Sensible Words.

At a reception of members of the National Institute of Mining Engineers, at Dsnver, Governor Pitkin deliversd a vsry sensible address, in which occurrsd the following univsrsally applicable sentence:

There has hsen a great deal of monsy mads in some valuable mines. There has been a great dsal lost from worthlsss minss. But whsn you dsdnct the loss from the gain, yon find a handsome profit to the State as ths balance. The nnloading of worthless stock to Eastern psople has done a great deal of harm to the State. The best husinsss men oftsn make mistakss, hut by the mistakes of tbeir earlier years they learn to do business on a safe scale. Nearly everything in life bas to he learned he experiensc.

So in Colorado, we have made mistakss in mining. But the expsrience we have gained has hslpsd ns. Mining has hsen considsred too much of a lottery, hut I take it that mining is as legitimate a business as manufacturing. Dossn't lnck entsr more or less into ths most conservative business in the world? The whole fortunes of the most prudent business msn may he swept away by soms panic which they could not avert or forssee. The trouhle is, people don't look upon mining snough as they do upon other kinds of hnsiness. In the Eastern States psople have been too rsady to huy a mine from simply looking at samples of ores. Do you huy a farm from looking at samples of dirt? A man who huys a mine should look carefully into what hs is huying. He should not hny a poor mins becanss it is cbeap. He should pick out a good mine and not a poor mins. Nearly all the money that has hesn lost in minee has been lost hy trying to work mines whose value has not been properly tested. You want also competent men to work your mines. You wouldn't think of putting an ignorant hlacksmith to work in a jewsler's shop! Yst that is the same thing that has heen done hy eoms people sngaged in mining in Colorado. I think we should work our good mines here and ahandon our poor ones.

Non-assessable. — A correspondent of ths Virginia *Enterprise*, writing from Candelaria, Columhus district, says: As an illustration of what is at present making the camp a dull place, we may make mention of the situation at the Entsrprise mine, sitnated to the southward of the Northern Bells, and in the same mountain. J. L. Callison, commonly called "Doc." Callison, has charge of ths work at this mine. We helisvs he formerly owned the whole, hut took in othsr parties, and incorporated the property. Thsy have a tunnel in 800 ft., and have already ent three vsins—the first 8 ft. wide, and containing ore that will go from $12 to $15; the second 40 ft. wide, and averaging $29 psr ton, and the third 2½ ft. wide, and containing still richer ore. The hest vein of all, and ths one showing richsst on ths surface, is hut 160 ft. ahsad, but work has long hsen stopped, for the rsason that the other parties interestsd have failed to furnish coin with which to pnsh the work forward. Were he alons interestsd in the propsrty, Mr. Callison might, himself have drivsn the tnnnel forward 160 ft., and hy this time would have been in hishest vein. Many other propsrties are in the same situation. They are waiting for partiss East or elsewhere to come up with suffioient coin to pay off ths workmen and rsums operations. This is what is the mattsr at the Princess mine and mill, which propsrty is owned and controlled hy Eastern men. If thsse men in ths East do not ses dividends in ahout three months from the time they start in on a mining enterprise, thsy grow weak-kneed and sick at the stomach. To gst any more money out of thsm, it is necsesary to charge upon thsm and dsmand it at the point of the hayonet, or at the muzzle of a revolver.

Hite's Cove Racket.—Ons day laet week, A. J. Bothwell, Superintendsnt of the Hits Gold Quartz company, retnrnsd from ths East, and intormed the miners, hy posting up notices, that ths mins wonld hs shut down until the lawsuits now pending wsre sattled. As the miners had not rsceived any monsy for their labor for soms time, and could gst no satiefaction, they naturally felt grieved, and to give vsnt to their dissatisfaction, held a meeting and appointed a committee of three to wait on the supsrintendent and see what could he dons. In their procesdings, thsy made a ssrions mistake and showed lack of judgement. It is said they marched holdly into the superintsndsnt's office with drawn rsvolvers, and demanded their money or his lifs. The superintendent, not heing of the "skittish" kind, opsned his safe to show to them that he had no money, when after considerahle ahuse they dispersed. Bothwell had the three men arrested and brought hefore Justice Temple of this place, where a charge of misdemeanor was preferred against them. They heing without either friends or money, consequently without counsel, defended their own case, which took up the greater part of two days. Eight jurors out of a venire of 18 were accepted, and another had to be issued to procnre the rest. After due examination and argument, the case was given to the jury, who immediately brought in a verdict of guilty as charged, and recommended them to the mercy of the court, who imposed a fine of five dollars or five days. The fine was paid. The names of the three men were Bsale, Branson and Godfrey.—*Mariposa Herald.*

An Accidental Strike.

One day last week the workmen who wsre digging the ditch from the Grand Cantral house for the Huachuca watsr pipe to connect with the Contention works, struck ths top of a vein of ore near the line of Grand Central and Contention, west of the ledge that has been worked from the grass-roots down to the 400 lsvsl. Mr. Leach put two men to work to crossout it to a greatsr depth than ths pipe ditch had done, which resulted in turning out rich ore. The vsin is from three to four feet wide, and from its presant showing is liable to opsn out into a bonanza of largs proportions. Both Contention and Grand Central will hs largsly hsnefited by this discovery. Ons of the hest stopes in the Grand Central mine was found after ssveral sporadic efforts upon that identical crosscut. It would he driven forward for a season and then ahandoned, nntil finally Mr. Leach determined to push it to a lsgitimate conclnsion, when a fsw fsst opensd up the ore body upon which thsy havs hssn working for ovsr six months.

In the Head Center thsy ars now working ore, the hest in the mine, which had heen rnn all around without discovsry, until Mr. Dugan, the present foreman, who is a number ons miner, unearthed it. In the little triangle of ground won hy the Contention in its late suit with Head Center, they are still taking out rich ore from a hlock that had hsen prospected hoth to the East and the West, the cross cuts through it having passed through harren spots in the ledge. These lessons show how nsar prospectors may hs to riches and how easily they may miss it. Too much care can hardly hs sxercissd in tboroughly prospecting evsry hundred feet vsrtical and horizontal upon the lode, or ors-bsaring ground. It is a matter of history that Richard Gird did not helieve the comhination shaft on the Goodenough would ever open mineral, and how at 75 ft. depth they strnck that famous ore hody that has yielded ovsr a million dollars, with all that portion sxtending into ths Gilded Ags still untouchsd. There may hs more valus in the Gilded Age share of the honanza than has already heen taksn out. Nothing hut the pick and drill can settle this point.—*Tombstone Republican.*

Esmeralda County.—A correspondent of the Virginia *Enterprise* says: The Indian Queen mins is a paying propsrty. The company has paid nsarly half a million in dividends. Within a fsw days a very important lawsuit with Patrick Guilfoyle, owner of an adjoining mine, has been decided in their favor in the District Court at Aurors, for at this mine, at Summit and at Candelaria, ws are still in Esmeralda county. It is said that a vast dsal of work has been done hy ths Indian Qusen Co.; that they have honeycombsd the whole side of the mountain in which thsir mine is situated. The ors contains a good deal of galens. The vein is very irregular. Often it is hut a few inches in width, then it sxpands and forms depoeits of great sizs. There ars undoubtsdly valuable mines all along this rangs for hundreds of milss to ths southward. As the railroad is advanced, this region will he thoroughly prospected, and mines can hs made to pay that have heretofore hsen almost valueless to their ownsrs. Ores are even now coming in from the front to meet the railroad. At Summit we saw, stacked up on ths platform, a lot of ors from Benton that was hsing shipped to Luning for sale, to parties who will take it through to Oakland, Cal. It was a galena ore, and, of course, must hs rich to hear transportation such a distance hy wagon and rail. Eventually, there will he smelters erectsd in this sscion of country for the reduction of snch ores. The railroad is now just sntering into a great and rich country—a country rich in agricultural products and the finsst of pine timher, as well as in mines and all manner of mineral products.

Gallinas.—Partiss are coming into this city daily with marvelons accounts of ths rich finds which are heing discovered in the Gallinas mountains. Among the many which are worthy of notics are the following mines, all rich in superior and hass metals: Ths Grand View mine is showing a well-dsfined vein of wire-silver and native coppsr which is sseven feet in width. A large sum has already heen offered for the Tenderfoot, hut ths parties who own it expect to get a good-sized fortuns before parting with their hig honanza. The Red Cloud and Deadwood are hsing operatsd hy a company from Missonri, and they ars meeting with sncess far heyond their anticipations. It will pay our citizens to look after thie mining camp, as some places in the Territory will soon derive a large revenue from the trade which is sure to go to ths town that rsachss for it. There are othsr towns nearsr than Las Vsgas, hut we havs the advantage of good roads, whils all the othsr trails (as they can hardly he called roads) are almost impassahls on account of the deep sands.—*New Mexican Mining News.*

Instead of hemoaning hard times, and sitting down to await some *deus ex machina*, in the shape of a rich mining company that will expend half a million dollars, and create a "hoom," it would be well if we each did our individual hest towards our town's progress. Every foot of development work on a good prospect helps the district forward, and every dollar'e worth produced here—whether it he in the shape of eggs, cshhages, chairs or what not—keeps that amount of money amongst us, and is, in so far, a henefit. We are too apt, in a mining camp, whilst straining after thonsands, to overlook the dollars.—*Pinal Drill.*

Mining Interests in the Pacific Northwest.

We are informed that mining experts are visiting this country with a view to ascertaining the value of mineral deposits and enlisting capital in developing such mines as are considered worth working. In former years, mining —quartz mining—was a precious business, more so than now—when experienced men examine lodes of ore and, from a practical and scientific standpoint, determine whether they possess sufficient pay to warrant development; also, whether the ore is easily reducible, for, in many instances, ores are so refractory that they cannot be reduced and their store of wealth saved by any economical and practicable process.

In the Cascade mountains, on the headwaters of the Santiam, and other streams putting into the Willamette, mines have been prospected and worked with partial success. On the Canal Fork, and at the head of the Little North Fork of the Santiem, in Marion county, a company has tunneled in on a ledge, and while they see little of their prospect, the fact that they keep at work, and will put in machinery to reduce the ore, is proof that they think they have a fair-paying mine. Through that region there are many quartz lodes that carry precious metals, and we feel confident that, in due time, mining will be carried on with some success all along the mountains, for the ores found in Douglas county are even more promising then those further north.

In Douglas county, on Cow creek, within nine miles of Canyonville, is a mountain of nickel, said to be the greatest deposit of the kind in the known world, that assays a large per cent. of that metal. This great ore bed has passed into the hands of Mr. Adams, of Oakland, Cal., a man of great wealth, who will, no doubt, cause it to be worked.

Through the Blue mountains, over Eastern Oregon, where placer mining has been carried on for 20 years past, there are numerous quartz lodes that carry gold and silver, but they have only been made to pay for working in a few instances, in Union and Baker counties. In Union county there is copper ore, and the deposits are extensive, but the ore has not yet been made to pay for working. Lead exists in the Cascade range, mingled with other minerals. The invention of some process that can better reduce base ores, and separate the gold and silver, will come in, and when it comes, will give value to mineral deposits all through Eastern and Western Oregon and Washington, for ores of gold and silver are found in the ranges bordering Puget sound and the Columbia. When traveling, lately, in Spokan county, near Medical lake, we heard of quartz discoveries, and met a man who was interested in them. He showed a sample of ore, supposed to contain silver and gold. We cite this fact to show how universally ore deposits containing precious metals exist through all this region. Even the sands along 200 miles of the coast of Oregon are so impregnated with fine gold as to be worth mining. Gold can be found on the bars of the Willamette river, and gangs of Chinese can be seen working on the Columbia, from The Dalles to Lewiston. Those thrifty people will not work for nothing, and they must make a dollar a day with their primitive rockers, or they would not continue at it.

The era of placer mining is gone by, but the source from which the float gold came remains. Southern and Eastern Oregon have known a brilliant season when their placers were worked, but now those districts are almost deserted. Northern Idaho saw a period of excitement not surpassed even by the greatest discoveries of California in 1849, and there was a time when mines acted as a magnet to draw thousands of adventurers to Northeastern Washington. The time may again come when these districts will be revived in popular interest. The development going on in all directions is inducement for mining enterprise, as it reduces all the cost of prospecting and working such mines. One natural result of railroad progress in this region will be to call attention of mining experts to these northern fields, and if they find inducement for capital to invest, then mining will be a source of general wealth, for the farmer must supply the needs of the miner, and the mechanic will have to build for him, so it is a matter of importance to have our mineral wealth explored, and make it pay its quota towards general prosperity.

In this sketch we do not allude to the immense deposits of coal and iron found along the west coast, and must be a means of great wealth in the present and future, but to mines of gold and silver that are waiting development in all parts of the Pacific Northwest. The more solid and reliable mines of coal and iron exist in such extent that we may look to them as one of the surest sources of wealth in coming years.—*Farmer.*

In Garfield district are many veins of silver-bearing quartz, that contain paying ore at or near the surface. While many of these veins are small, there are a number of large size. The Farrington is one of the leading mines of the district, and has produced a large amount of rich ore. Last Thursday they struck very rich carbonate ore in the bottom of the shaft.

The great iron bridge of the Atlantic and Pacific railroad over the Canyon Diablo, in Arizone, has recently been completed. It is 500 ft. long, the canyon being some 240 ft. deep. The highth of the bridge is 240 ft., or 14 ft. higher than Bunker Hill monument.

Useful Information.

Lime Cement.

This cement is one of the most valuable known, not only on account of the great variety of purposes to which it is applicable, but also by reason of the rapidity with which it sets, and also its great tenacity and durability, and its incapability of being again resolved by any ordinary cause. It is used with advantage in uniting wood to wood, wood to cast iron, wood to brass, cork to brass, wash leather to wood or cork, glass to glass, ivory to ivory, etc.

Take of good, moist cheese, any convenient quantity, place it in a saucer, and pour thereon boiling water, working it with a knife so as to expose it thoroughly to the action of the water; as soon as this latter becomes turbid, pour it off and add more; repeat this process until nothing remains to be washed away. The residue of the cheese will now have assumed a waxy consistency, which will be indicated by its allowing of being drawn out into long filaments; when this is the case, about half its bulk of quicklime should be added, and the whole well kneaded with a knife or spatula. It must be used immediately, as it sets in about 15 minutes. This cement may be made to keep by drying the waxy substance, pulverizing it, and mixing therewith the proper portion of lime. It should be kept in an air-tight bottle. When required for use, knead it into a paste with a little water. This is a superior cement, but not so satisfactory as the first, as the ingredients of the compound are liable to deteriorate by exposure.

An excellent cement for wood is the common shellac varnish, *i. e.*, shellac dissolved in alcohol. It is said to be more effective than glue, and to join the parts together stronger than if they had never been separated.

Another cement can be formed by mixing white glue (or geletine), four pounds; dry white lead, one pound; soft water, four quarts, and alcohol, one quart. Boil the glue and lead in the water by means of a water-bath. The glue being dissolved and the alcohol added, stir the whole until they are well mixed. Pour the whole into a phial for future use.

Parchment.—Parchment is made of skins of sheep and lambs, though that kind which is used for the head of drums is said to be made of goat skins. Vellum is a finer, smoother, white kind of parchment, made of the skin of young calves. The mode of preparation is first to take off the hair or wool, then to steep the skin in lime, and afterward to stretch it very firmly on a wooden frame. When thus fixed, it is scraped with a blunt-iron tool, wetted and rubbed with chalk and pumice stone, and these scrapings and rubbings are repeated several times on each side of the skin till it is fit for use. Parchment was employed in very ancient times, and it is curious that from about the seventh to the tenth century, it was beautiful, white and good, but that in later times a very inferior, dirty-looking kind of parchment came into use, which has the appearance of being much older than the good. The reason for this is supposed to be that the writers in these latter centuries used to prepare their own parchment, while at an earlier date it was a curious art, only possessed by the manufacturers. Parchment was sometimes so rare and scarce, that great numbers of the older manuscripts were erased with pumice stone, or the ink washed out with some chemical substance, in order that they might be used again for writing upon.

A New Milk Tester.—A newly invented instrument, by Professor Heeren, for the purpose of testing milk, seems to work well. It is named the "pioscope," and consists of a disk of black vulcanized india rubber, having in its middle a very flat circular depression. A few drops of milk well mixed are put in the hollow, and covered with a plate of glass painted with six shades of color, radiating from a small uncolored circular spot in the middle. The colors range from white gray to deep bluish gray. The layer of milk is seen through the uncolored spot in the center, and its color can thus be compared with the radiating colors, and its quality is judged according to the color with which it coincides. Thus, the richest color stands for cream, the next for very rich milk, and then follow normal, inferior, poor and very poor.

Aluminum Silver.—Aluminum silver is made by melting together one part of silver with three or four of aluminum, and is highly prized as a material of construction for such articles in which lightness is one of the objects sought. Instruments used for marine observations, such as sextants, made of this alloy, have been favorably received by practical navigators, and parts of such instruments which, if made of other metal, would weigh four pounds, will, when made of this alloy, weigh only one pound. The alloy is easily worked, and is, therefore, appreciated by mechanics, and is free from all objections to which pure aluminum is open. The latter is very soft, and has the property of sticking to the file when worked, thus severely taxing the patience of the operator.

Wooden Plates.—The bulk of the wooden plates now in use come from Newbern, N. C., where they are turned out at the rate of 50,000 a day. They are made from the old sweet gum, with which the swamps and river low grounds abound, a tree which the farmers and land owners generally could find no use for.

Skinning Animals.—The value of a skin for leather depends considerably upon the care and manner in which it is taken off. The following penal statute, passed by our ancestors in 1642, shows that they well appreciated the great loss consequent on bad and careless skinning: "No butcher, by himself or any person, shall gash, slaughter or cut any hide of ox, bull, steer or cow, in slaying thereof, or otherwise, whereby the same shall be impaired or hurt, on pain of forfeiture for every such gash or cut in any hide or skin, 12 pence." An experienced tanner gives the following directions in regard to the cutting or opening of the hide before the operation of flaying: This is always best performed when the most of the skin is thrown between the fore and hind legs, leaving the hide square in its form. Tanners of upper leather know the value of this mode of skinning, by its increase of measure over the one practiced by many persons in sticking or bleeding the animal, by cutting its throat from ear to ear, and in opening the hide, not running the knife far enough up on the brisket before they cut down the skin on the fore legs; or not down far enough on the flank towards the tail before they cut through the hind leg.—*Ohio Farmer.*

A Washable Whitewash.—By mixing three parts powdered silicon (flints) and three parts powdered marble, two parts china-clay and two parts freshly-slaked lime, a paint or whitewash is obtained, which, by frequent wetting with water, forms a silicate, and becomes, after some time, as hard as stone, while remaining porous. The four substances form the body of the paint, to which any other color suitable for mixing with lime may be added. The surfaces are painted somewhat thickly with this, left to dry for a day, and frequently watered the next day, whereby the paint becomes weather-proof. This paint or whitewash may be washed without losing any color, but becomes harder and harder, so that it may even be cleaned with a brush.

The Weight of Air.—All know that air has weight, but one is apt to have rather vague ideas as to the weight of comparatively limited quantities of it. A cubic foot of air weighs 538.1 grains, or something over one ounce; 13.06 cubic feet weigh one pound. About 65 cubic feet of air furnish one pound of oxygen. An apartment 8 ft. high, 12 ft. wide and 13 ft. long, contains about 100 lbs. of air; and a room 40 ft. square and 18 ft. high contains about a ton.

Keep Digging.

Dan De Quille, writing from Candelaria, Columbus district, to the Virginia *Enterprise*, says:

We saw some Candelarians whom the present passing dull spell seemed to have subjugated. Of course, all men who are in business desire to make money right along, without any let-up, but they seldom do so, no matter where they are located. As for Candelaria, it appears to us, from all we have seen of the place and its surroundings, that it has not fairly started. Its good time is surely yet to come—a better time than it has ever yet seen—though just now, it appears to be somewhat ailing from some cause; it may be the "cold feet" of the Northern Belle resting on the pit of its stomach, or it may be something else. Whatever it may be, its influence cannot last forever. There is in and about the town a great and rich mining region, and if the people only keep digging—digging as much and as often as they can—there is the probability that sooner or later something will be struck which will cause the place and the people thereof to get up and howl. If we see just one man up on the side of a mountain digging here and there, we watch his movements with some interest, and think he is liable to strike something, so long as he keeps at work, but when he shoulders his tools, marches down and begins leading the indolent life of a hermit in his cabin, we lose interest in the man, and the hope of a mine on the hillside departs. As it is with the man, so it is with a community.

A custom mill, honestly and squarely conducted, would be a good thing for Candelaria in its present condition. This would give poor men and small mines a start. There are plenty of places where small lots of ore could be got out at once. A poor man who has a mine that yields some ore at or near the surface could get out 10 or 15 tons of ore, and on getting it worked would have means to hire an assistant, when he could get out a twenty or thirty-ton lot, and soon would be going on all right. Chloriders would begin operations all about the place, and some of these would doubtless make good strikes, sooner or later, while following down their surface finds. A man who began by packing ore down the mountain in a flour sack might thus become a millionaire. Now, you may take a hull by the tail and sling him clean across the main street without knocking over a single genuine millionaire.

At Candelaria we observed that a singular custom prevails, owing, probably, to the heat of the summer climate. At the restaurants, and other eating places, as the boarders file in they take off their coats and hang them on the walls. As we looked at this performance in some surprise, Dave James, a well-known old Comstocker, who did for us the honors of the place and explained manners and customs, said: "In this place, people are expected to take their coats off when they come to table, but you need not do so unless you wish; being a stranger, you will be excused." We thought that was all very good, and free and easy.

Good Health.

Light and Near-Sightedness.

Professor Pickering, of Harvard Observatory, points out in *Nature* that the color of gaslight has nothing to do with its painful effect upon the eyes of students and others. To test this question, he had a tin lamp shade constructed, consisting of a tube six inches in diameter by eight in length. One end was closed by a reflector, and the other by a piece of very light blue glass. Two holes were made in the sides, through which passed the glass chimney of an argand gas-burner. By experimenting with a shadow photometer, a position was found where the light received on a book was of the same intensity and very similar color to that from a window in the daytime at a distance of about six feet. A few minutes reading, however, was sufficient to convince him that the new light was far more trying to the eyes than an ordinary gas flame would be, the ill effects being due to the intense heat thrown down by the reflector. And this, he thinks, is the source of the whole trouble in the ordinary gas-burner. The heat radiated by the flame, the heated chimney and shade, and reflected from the printed page and all other white paper lying on the table, dries the eyes, the lids, the forehead and temples. Temporary relief may be found by bathing the face and eyes in water, but it is only temporary. The hot, dry air from the lamp is also harmful, and no doubt contributes its share of injury to the vision. These evils may both in part be remedied by placing a pane of glass so as to intercept the rays about the lamp before they strike on the book or the face; but it must be placed at such a distance from the lamp as not itself to become heated.

The hotter the flame the whiter it is, and the more light is thrown off in proportion to the heat. Hence, oculists are recommending lights as the students' and moderator lamps, which burn with a small, hot and very brilliant flame, as compared with that furnished by the argand and fish-tail burners. Statistics, said Professor Pickering, show how alarmingly prevalent near-sightedness has become of late among students. Hence anything which will tend in the future to prevent this widespread defect will be a boon to mankind. He had great hopes of the electric light in this respect. In it there was the maximum of light with minimum of heat. The ever-varying intensity was an objection, but he thought we might look forward to the success of the light from the incandescent carbon strip, in the near future, as a remedy for "the most widespread evil that afflicts the human vision."

Unsuspected Poisons.

It seems as though we are bound to undergo a certain amount of poisoning, eat what we will, and it is, upon the whole, perhaps, a happy thing that we are, as a rule, able to submit to it with so little interference with our mental composure. The *Pharmaceutical Journal* quotes the opinion of an eminent analyst, from which it appears that decided symptoms of poisoning result more frequently than we are aware of from any considerable consumption of potatoes. Among the poorer classes, who live largely on potatoes, such symptoms are said to be common, more particularly when the tubers are very young or very old. Such potatoes, we are told, contain considerable quantities of solanine. The poison was found in very unmistakable quantities in the stomach of a man who had been, for two or three days previous to his death, living on nothing but raw, unripe potatoes, and there seems to have been no room for doubt that this diet accounted for the presence of the poison. It is said to be found chiefly, if not entirely, in the skin of the potato, and is soluble in boiling water, and we may, we suppose, assume therefore, that a very young or a very old potato, boiled in its skin, must be, to some extent, permeated with solanine, and must be unwholesome to an extent that may become serious, if partaken of in large quantities.

Another unsuspected source of poison is said to be maize or Indian corn. A disease as fatal in Italy as consumption is in this country, is attributed entirely to the exclusive use of this cereal, which is thought to be especially dangerous if ground in a damaged condition—damaged, we suppose, by incipient decay, though that is not stated. There is said to be one remarkable fact connected with the disease which is thought to have its origin in this source—the disease known as pellagra. Sufferers from it who commit suicide, always do so by drowning, a fact displayed by the pleasure afforded by the sight or touch of water, which constitutes a symptom of the disorder.

Sulphuric Ether in Pneumonia.—Dr. Samuel W. Francis, Newport, Rhode Island, reports the successful treatment of an acute case of pneumonia, by the inhalation of sulphuric ether. He says that "if seen early, during the first stage, by inhaling ether for 30 minutes, every six hours, many severe and protracted cases of sickness would be arrested." Dr. Francis recommended inhalation of sulphuric ether for bronchitis, in 1868.

Let the Children Cry.—Certain physicians say that crying should not be repressed in children, as the consequences may be Saint Vitus dance or epileptic fits.

SAN FRANCISCO:

Saturday Morning, Sept. 23, 1882.

TABLE OF CONTENTS.

GENERAL EDITORIALS.—Perfect Combustion of Coal, 193. Passing Events; Mining Appliances, 200. The Denver Exposition—No. 6, 200-201. Academy of Sciences; Lime for Blasting in Mines, 201. Our Commissioner at Denver, 201-204. The Coming Transit of Venus; Patents and Inventions; Notices of Recent Patents, 204.

ILLUSTRATIONS.—A Device for the Combustion of Coal, 193. Arrangement for Lime Blast, 201.

MECHANICAL PROGRESS.—Wrought Iron Philosophically Considered; Honesty in Building; Grinding Mill Picks; Friction; Wire-Drawing; Still Inventing, 195.

SCIENTIFIC PROGRESS.—Tracing the Soul; Recent Progress in Telephony; A Novel Flute; The Progress of Civilization; Ocean Telephone, 195.

MINING STOCK MARKET.—Sales at the San Francisco Stock Board, Notices of Assessments, Meetings and Dividends, 196.

MINING SUMMARY from the various counties of California, Nevada, Arizona, Colorado, Idaho, Montana, New Mexico, Oregon and Utah, 196-7.

USEFUL INFORMATION—Lime Cement; Parchment; A New Milk Tester; Aluminum Silver; Wooden Plates; Skinning Animals; A Washable Whitewash; The Weight of Air, 199.

GOOD HEALTH—Light and Near-Sightedness; Unsuspected Poisons; Sulphuric Ether in Pneumonia; Let the Children Cry, 199.

MISCELLANEOUS.—Contributions to the Ethnology and Geology of the Pacific Slope; Dos Cabezas Notes, 194. The Star Mine; Passing Away; The Tombstone and Way Up Mines; Pomegranate Drink; Sensible Words; An Accidental Strike, 198. Keep Digging, 199.

Business Announcements.

Ore Concentrator, G. A. Metcalf, Malden, Mass.
Fruit Ranch for sale, Mrs. Geo. Dimpfel, Benicia, Cal.

Passing Events.

In looking over the summary of mining news of the week, which is given on another page, one is struck with the fact that a very large amount of work is going on in all parts of the country, of which the general public know nothing. Men are hard at work on small claims in various districts, and are working for themselves. This is a hopeful sign. The large companies draw the most attention to a camp, but they draw the most money out too. The individuals do not attain a competence with small mines, though miners have an opportunity to make money much faster than when working for big companies, and the country is settled up with a population more likely to stay. When miners get to working for themselves, they make better citizens than when leading a sort of nomadic existence.

The appearance of a comet which has suddenly been discovered simultaneously by a large number of independent observers, shows that there is great interest in scientific research in this branch. Arrangements are being made in all civilized countries to observe the transit of Venus, which takes place in December.

THE business of the Collection District of Puget Sound is rapidly increasing. The receipts of the office during August, from all sources, amounted to $6,300, which is in excess of any previous month in the history of the district. The entrances and clearances numbered 112 ships, which is a number beyond precedent.

THE great French railway companies for some time have employed women as ticket and audit clerks, as also have the Credit Foncier and several banks and public companies in France. The Corporation of the city of Paris means also to employ women in their offices, and 300 situations are offered.

Mining Appliances.

When mining first began in this State, with all the genius and enterprise of the American people, no important discovery in the way of machinery for mining was made which had not long been in use in South America, Mexico or Europe. The same necessities gave rise to identical contrivances for saving labor, and it is sufficiently creditable to our miners to say that, without any knowledge of what others had done, they frequently improved upon the originals. The fact demonstrates very clearly that want of knowledge, even in the preliminary stages of mining, is a source of loss. When the precious metals are easily obtained, and the profits of individual labor are large, less injury results from ignorance than in the subsequent stages of the business, when capital is required, and the processes of reduction are more complicated.

Mining differs essentially from every other branch of industry. Unlike agriculture, there is but one crop in a mine. As the work progresses, the stock of mineral is decreased, and can never be replenished by human art. The farmer changes his crop or his system of cultivation, and his lands can be improved and profits increased by experience. So, also, in manufactures and mining. Hence it is important that the experience of mankind should be preserved, so that error may be avoided.

With mining to-day, however, the machinery is one of the most important items in which the question of profit is involved. In California we did little as quartz miners before 1860. There were quartz veins discovered, of course, but little progress was made in working them, and the work was more or less of an experimental nature. The Mexicans, with their arastras, were the only successful quartz miners. Experience in their own country enabled them to realize fair profits upon their labors. Their system of mining, however, was too slow for an American population, to whom large investments of capital were of little consequence, provided there was a prospect of abundant returns.

We have been gradually getting experience in California which has not only been of great value to us, but to other States and Territories. Our practice has been the basis on which others have worked. Our mechanical appliances of mining are known abroad, and our experience is utilized by mining communities everywhere. Our mechanics are acknowledged to be the most skillful and expert in all sorts of mining machinery and appliances. We have learned now by experience, and every detail is one which has been tried and proven. Persons who experiment in quartz machinery without consulting California experience will find they are very liable to be working over old ground abandoned long ago.

THE BOOM AT SODA SPRINGS.—The scene at and around the railroad station at Soda Springs is a very busy one just now. The railroad company has erected a large and commodious warehouse and laid side tracks and switches to the smelter and for its own conveniences. New houses are going up about the smelter and near the store of M. Schwartz. J. P. Davis has just completed an addition to the railroad restaurant to accommodate the employes of the Esmeralda Copper Company. The building is thirty-two by sixteen feet in size, and is situated back of the kitchen of the original dining-room. Wm. Stansfield is engaged on a dwelling for his family, and the men he employs as teamsters and in the handling of the ore of the copper company, while Mrs. Conner, of Aurora, has the plans and estimates for a large, new lodging-house, to be put up at once. There are about seventy-five men in the near vicinity, and none of them idle. It is reported that the smelter is to be shut down, temporarily, in a few days, to enable the work at the mine to be got in better shape for the more rapid extraction of the ore. This will be accomplished very soon, and operations at both the mine and furnace will continue uninterruptedly for a long run.—*Candelaria True Fissure.*

MINING ABOUT SILVER CITY.—Down at Silver City, Nev., the people are actively engaged in mining and milling the ore of the many gold-bearing quartz veins of that section. They have their own little water-mills, and are a regularly organized mining community within themselves. The state of the stock market does not disturb them. So long as gold remains firm they are all right.

THE iron workers' strike is at an end in Pennsylvania, after lasting 116 days. The men have withdrawn their demand for an increase of wages and accepted the old rates. The loss in wages has been between $8,000,000 and $10,000,000, while the employers only suffered the loss of contracts which they could not fill.

A COMPANY has been formed in Chicago for the purpose of introducing dry improved dry washing machines to work the rich placers in the vicinity of Pinos Altos, N. M. J. G. Anderson, the company's agent at Denver, says the machines will be on the ground inside of four months.

THE Mexican National railway was accepted on Monday by the engineers of the Mexican government, and a municipal ball was given in the evening to celebrate the completion of the line

The Denver Exposition—No. 6.

[Editorial Correspondence.]

Even now, in the seventh week of the exhibition, minerals are continuing to come in. Several tons were received three or four days ago from New Mexico, which are now being put in place. Last week, the attendance was quite large, but during the present week, an exciting political contest has been going on in connection with the Republican State convention, which has no doubt had much to do in keeping people away. The exposition will probably be continued until the 15th of October. Your correspondent continues his references, taking for this week Summit and Park counties:

SUMMIT COUNTY.

Although the exhibit from this county does not attract quite so much attention as that from some other sections, still it has been and yet is one of the most important mining counties in the State. The greatest hindrance to mining operations in this county, heretofore, has been the heavy snowfalls on the high range of mountains which separates it from the ore markets or localities where smelting furnaces can be made available. This, however, is now being overcome by the erection of furnaces in the immediate vicinity of the mines. There are now eight furnace plants in the county, which, together with the completion of the Denver & Rio Grande railroad to Kokomo and Frisco, is giving a new impetus to mining, and otherwise rapidly advancing the development and prosperity of the county. Summit is the second county in extent of area in the State. It occupies a central position in the great miners' belt, and, as its name implies, holds a very elevated position, topographically. Its extreme Eastern border reaches, and at some points passes over, the great dividing ridge of the Rocky mountains, or Sierra Madre range, while westward it extends far into and through the elevated tableland of the Rockies to the western line of the State. The mines are all found in this high mountain portion, and while they have already produced a large part of Colorado's wealth, the indications are that they will do even more in the future than they have in the past.

Placer Mining.

Summit has been and still is one of the most important placer-mining counties in the State. The placers are very extensive, and they are worked in some instances over 100 ft. in depth, by the same appliances that are used in California. The lack of water, however, is a great drawback; hence, smaller streams are generally used. The miners sometimes employ a method called "booming," by which, after a head of water is allowed to accumulate, a gate is suddenly opened, and the entire accumulation suffered to flow with great force through the ground sluices to clear away any obstructions which may have gathered. This is common in many places in California, where it has been in vogue for years, where water is scarce.

Prof. Gunning says, in his report published in the Summit County *Leader*, of Aug. 19, 1881, that upward of $25,000,000 had been taken out of the placers of this county, up to that time.

As there are no indications of any ancient river beds in this State, such as we find in California, it follows that all the placer gold here is derived from the breaking down of the quartz veins near where the placers are found. This is especially noticeable at Black Hawk and Central City, in Gilpin county, a locality which I visited a few days ago, where one of the forks of Clear creek, from its mouth up about eight miles, has been found to be exceedingly rich, and has been worked over several times, up to the localities mentioned, where the mountains are completely honey-combed with quartz veins. Above that point no considerable amount of gold has been found. These are the Gilpin mines which furnished the subject of my third letter. The same is true of the stream which passes through Leadville, although there, but few of the deposits come to the surface, and there was consequently less gold and silver found in the placers. There is only one locality in Summit county where there are very deep placers, and that in a single line, for a distance of some 20 miles along and nearly parallel with the southerly fork of Blue river. These deep diggings are very much like the ancient river beds of California, and in one locality are opened to a depth of 140 ft. without finding the bedrock. These deposits are generally about 250 ft. above the present stream, which at some time in the past must have met with some obstruction which gradually filled up its old bed and finally changed its course. The deposit is entered by cuts through the rim rock, and is hydrauliced. It pays from the surface down.

There are no Chinamen working in these mines. Formerly, a few were seen working here and there, but they have nearly all left the county, a few only remaining to "washee clothes."

The Quartz Veins of Summit County.

It is somewhat singular that the quartz veins of Summit county did not attract the attention of prospectors at an earlier date, considering the extraordinary richness and abundance of the placers there. But they are now being worked with considerable energy and profit, and will doubtless, ere long—as soon as they are thoroughly opened—prove quite as productive and far more permanent than have her placers. It is only about 12 years since quartz-mining for gold and silver first began to attract attention here. The veins are generally fissures in granitic and silicitio rocks, large, strong and well defined, and nearly all worked for silver. As usual in heavy veins, the great mass of the ore is of low grade, yielding here from 40 to 60 ounces of silver to the ton. Forty ounces of silver to the ton is about as low a grade as can be profitably worked, at present cost of transportation and smelting, and even such ore is sorted so as to carry it up to a higher grade before smelting. The silver is associated with galena, zinc-blende, gray copper and more or less "heavy spar." Most of the ore is hand picked over; and thus, as sent to the furnaces, yields from 200 to 800 ounces to the ton. As facilities for transportation increase, and furnaces multiply, the low-grade ores are being more generally worked.

The development of carbonate ores in the vicinity of Breckenridge has created considerable excitement within a year or two, and I am informed by credible parties that some valuable discoveries have been made, and as a further evidence that such is the fact, quite a large town has already grown up at that locality. This and the neighboring settlements of Montezuma, Ten Mile and Eagle valleys make a very fine exhibit. From the new discoveries constantly being reported, it would appear that the carbonate belt is quite extensive. These ores carry gold, silver and lead. One specimen from this locality, weighing 400 lbs., is on exhibition.

One of the most promising mines in the county is the Queen of the West, which makes a very fine exhibit. About 300 ft. of drifting has been done upon this mine. The ore is all treated by smelting. The vein is very heavy, seldom less than five ft., and, at least in one instance, opening out to 20 ft. in thickness.

Gold and Silver in the Old Red Sandstone

A new and quite an interesting district is now being opened up in what I am told is referred to the old red sandstone formation. Numerous specimens from the mines here are shown which give good indications of value. No large specimens of the wall rock are present, but such as are here, and in some cases adhering to the ore deposit, indicate that the above statement is correct.

The Warriors Mark was the first location, and is the one most thoroughly opened. A joint stock company has been formed to work it. The ore, thus far, is very rich. The first-class assays from $400 to $800 to the ton in gold, silver and copper; second-class, $300; fourth-class, $100. A large amount—about 100 tons—has already been taken out; all from an open cut, from the bottom of which a shaft is now being sunk.

The Snow Drift is another mine in the same locality, and also in sandstone. Two others, the Sankey and the Tame Deer, are also being opened here.

Gold Mines of Summit County.

Aside from the placer and silver mines already alluded to, Summit county can boast of some of the most promising for milling gold mines in the State. One of those mines, the Ontario, makes a very fine display of rock covered with ribbon-like strings of free gold—a form of crystallization indicative of carrying a large alloy of silver. This mine has only been opened about one year. It has but three owners, who work the mine themselves. They have recently put in operation a five-stamp mill to work the low-grade ores. The richer and picked specimens are crushed in a hand mortar. The specimens on exhibition are but a portion of about 600 lbs. of rock, which is valued at $10,000. The Hunckadori also shows a case full of very rich specimen rock. This company is also raising a five-stamp mill. Rock from the Brooks-Snyder ore is on exhibition, running very high in gold and silver. The Bonanza mine is represented. It has a vein sometimes reaching 15 and 30 ft. in width, free milling ore. It is reported that the average yield of that which has been milled is near $40 to the ton (probably picked rock). A 600-lb. chunk, besides smaller specimens, is shown from this mine. Many other more recent discoveries are reported and shown. Some 100 mines are reported as containing free gold, the most of which it is thought will in time be worked. Mr. M. Silverthorne, of Breckenridge, represents this county as Commissioner.

PARK COUNTY.

This county takes its name from the celebrated South park. This park comprises about 1,000 square miles, and it is at an average elevation of about 9,500 ft. above the sea level. It is located just to the east of Summit county above described. The region is rich in gold and silver, and was formerly quite noted for its placer yield. About $2,500,000 in gold had been taken out before the discovery of silver here. The silver deposits now, however, take the lead, and promise to be permanently valuable. Since this discovery the gold yield has not much exceeded $500,000, while the silver yield for the same time has exceeded $3,000,000. The total gold and silver produced by this county was set down at $6,114,000 at the beginning of 1880.

Extent and Character of the Mines.

The mineral belt of this county is about 35 miles long, 14 wide. Silver is generally found here in limestone, but sometimes in porphyry. These mines are generally considered the extension easterly of the Leadville deposits. Like them, the mines here consist mostly of deposits, chambers and pockets, often found, as at Leadville, between the limestone and the porphyry. There are also many fissure veins. The mines of this county are being steadily and rapidly developed. The deposits and veins carry galena, gray copper and zinc-blende in a quartz gangue. Silver glance sometimes occurs. Sometimes a heavy-spar gangue takes the place of quartz in the higher limestone regions.

An Elevated Mining Region.

Mining is in some instances conducted here far above the line of timber and vegetation,

from 12,000 to 14,000 ft. above the sea level. As a general thing, even in this elevated region there is no cessation of mining in the winter.

The first silver mine which attracted attention here was the Moose mine, which is still being steadily worked. The yield of this mine for the first eight years was $1,150,000. This is a deposit mine, and its claims cover a surface area of 160 acres. The company own roasting and amalgamating works, with two furnaces.

The Dolly Varden, also a deposit mine, is generally considered next in value to the Moose. The company holds a large surface area. The deposits in this mine are much smaller, but generally richer than those found in the Moose. There are a large number of producing silver mines. The country is divided into 11 different mining districts.

The Gold Mines.

The placers of the South Platte, which takes its rise in this county, are said to have yielded upwards of $1,700,000. The Philips mine, in Buckskin district, is perhaps the most important gold mine in the county. The mine is still worked on quite an extensive scale, owning its own stamp mill. The lode is very wide, often opening out to over 25 ft. The Orphan Boy, supposed to be upon the same lead has yielded its owners $250,000. There are quite a number of gold mines in Montgomery district. The gold veins are all true fissure veins with quartz gangue. There are several stamp mills in this district. There are a few Chinamen at work in the placers in this county.

Coal, Salt, etc.

Coal seems to be found in most of the counties throughout the State, and even Park is no exception; quite a number of coal mines are now being worked here. The Denver and South Park railroad own quite extensive coal properties, which are now being worked with steam machinery. The coal is used for locomotive purposes. The railroad has done much toward developing the resources of this county.

In the southwestern portion of the South park, saline springs are found of great strength and volume, at which salt works have been established.

The Exhibit of This County

is very fine and characteristic. It occupies a very elegant pavilion, near the center of the mineral section, as shown upon our diagram. Mr. A. A. Reviere is Commissioner for Park county, assisted by R. A. Kirker.

W. B. Ewer.

Academy of Sciences.

A regular meeting of the Academy was held on Monday evening last, Dr. H. W. Harkness in chair.

The following were elected members: Miss Isabel Downie, Robt. Hawxhurst, James M. Kelley, Alfred Barstow and John A. Paxton.

Following were proposed for membership: Joseph D. Redding, David Wooster, W. A. Clinnes and C. W. Brush.

The donations to the museum were as follows: A collection of 33 species, and 51 specimens of reptiles, and 294 species and 1,423 specimens of conchology, collected and identified by W. N. Lockington. This collection was presented to the Academy by J. M. McDonald, R. W. Simpson, Chas. Crocker, James D. Fair, B. B. Redding, G. H. Saunders, C. H. Hinton, J. D. Douty, J. O. B. Gunn; from O. C. Marsh, casts of *Hesperornis regalis* and *Hesperornis crassipes*.

From C. H. Redington, specimen of ammonites (*Acute marginatus*). From H. H. Brown, one rat-fish from Mendocino, and four fishes and one frog from Sinaloa, Mexico. From A. E. Brush, two specimens of *Venilla*. From R. W. Simpson, bottle of marine worms. From Dr. Harkness, three specimens of *Caligus*, parasitic on salmon. From Dennis Cook, two bottles of insects. From H. S. Durden, of Columbus, Esmeralda county, Nev., 13 specimens of minerals. From C. Van Dyke Hubbard, one bottle of tinkel and one of salt. From Melville Attwood, specimen of seabeach gold and iridiosmine from Gold Bluff; specimens of Grass Valley gold and Bodie gold. From C. D. Gibbes, 59 specimens from State's Prison Quarry, Nev., including shale, sandstone, fossils, etc. All these specimens are from the place where the mammoth footprints recently described were discovered.

The Secretary read a paper by Prof. George Davidson, giving an account of the parties now fitting out for the observation of the transit of Venus, on December 6th. This is given in another column.

Mr. Lorquin read a paper "On the Disappearance of the California Vulture." The *Cathartus californianus*, commonly called the great California vulture, or condor, is one of the largest, if not the largest, of all flying birds. But a few years since, large flocks soared over our coast and mountain ranges; but now scarcely a single specimen can be found. The sudden disappearance of these voracious birds, heretofore so abundant, may be ascribed to several causes. Our valleys, where thousands of cattle formerly roamed, have been turned by human industry into wheat-fields, depriving them of supplies of dead carcasses of cattle. Many may have perished from eating poisoned lambs left to destroy California lions, coyotes and wildcats by herdsmen. The condor in the South American Andes is still very plentiful in its native haunts. In California their numbers have become reduced, and the species almost extinct, owing to a scarcity of carrion food sufficient to satisfy their voracious appetites, and in a short time this remarkable bird, the great scavenger of our plains, will be but a feature of the past.

Lime For Blasting in Mines.

Among the great number of accidents which have occurred in coal mining, attention has of late been called to the use of lime for blasting. Many persons suppose this to be entirely new, but it is not. An old subscriber of ours, who was manager and also largely interested in the Ecton copper mine, Staffordshire, England, informs us that in the old records of that mine mention is made that about the year 1620 the explosive force of gunpowder was called into the assistance of the mine. It was first used in Hungary, and in 1677 also employed at the Ecton mine by German miners, who were brought over to England by Prince Rupert. Before that time lime was only used. In an old level at that mine, called the Dutchman, as late as 1843, the difference between the two modes of working could be plainly seen when examining the sides of the old workings.

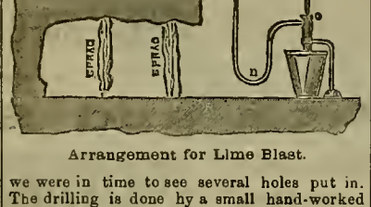
As an illustration of how the plan of blasting with lime is looked upon in England, it may be stated that the recent Miners' Conference brought forward a proposition, as follows:

"That we urge upon the Home Office the necessity of finding means to test the principle of bringing into use the new system of getting coal with lime."

At the Shipley collieries, when powder was abolished, wadging was resorted to, and for the extra work caused thereby there was paid to hewers or getters 4d per ton extra. As a matter of course, this set to work the inventive genius of the managers, the result of which was the patenting of a successful process of getting coal by compressed or consolidated lime.

A committee of the Miners' National Union went to see this caustic lime process at work, and made the following report thereon, which, with the engraving we have had made, will make the method intelligible.

We attended the Shipley collieries June 19th last. We went down the pit in company with Mr. Mosley, Mr. Smith, Mr. Moore, the resident manager and others, and made direct to the face of the long-wall workings. We found about 30 yards of coal ready holed underneath. The drilling was being proceeded with, although



Arrangement for Lime Blast.

we were in time to see several holes put in. The drilling is done by a small hand-worked machine, and although the drilling is three inches in diameter a man can drill three feet in six or seven minutes. The work is done both easily and quickly. When the hole is drilled and cleaned out, a perforated iron tube with a calico covering is inserted at the top portion of the hole, and then the lime cartridges are put in. The cartridges have a groove, so that they run along the tube. After a sufficient number of cartridges are put in, the tamping is done, and a small force pump applied, so as to force the water to the back portion of the hole, and round the whole of the lime. The holes in the Shipley hard seam are about six or seven feet apart. In many cases they might be put further apart. Spraggs are used. The shots were all ready at one time. The insertion of the water began at one end, and proceeded very quickly indeed. The water was not inserted into the first hole more than a quarter of a minute before the process of tearing commenced, and in a very short time the spraggs were drawn, and there was down ready for sending to bank, about 30 yards of coal, in almost one unbroken piece.

The cartridges are made at the pit by an extremely easy process, and do not cost more, and in many cases would cost much less than powder. The cartridges are made from finely powdered lime by hydraulic power, at a pressure of about 40 tons. These engines are easily erected and cheaply worked, and the using of the lime is both simple, safe and effective.

We have no hesitation in pronouncing the use of lime in long-wall working at Shipley colliery a complete success; and we have no doubt that what will answer there will also answer in the long-wall at other places. It may also just as easily be worked in wide boards where the coal is nicked or cut up one side. Neither have we any doubt as to its effectiveness in stone canoches. The only doubts we have are with respect to winnings, or headways, and stone-drifts, and so far it has not been tried in such places. But wherever practical, it should be without delay put into operation, and thus take away the possibility of any further disastrous catastrophes arising from the use of powder.

The President of the Bergh Society of Massachusetts tells some Boston man, who are getting up a fox hunt, that he will prosecute every one who takes part in it.

Our Commissioner at Denver.

Address of W. B. Ewer on the Industrial Resources of California.

The National Industrial Convention, in session at the Tabor Grand, Denver, adjourned Monday afternoon for the purpose of visiting the Exposition, and listening to addresses on the industrial resources of the West, from prominent speakers.

About half past 3 o'clock the delegates assembled at the Exposition to the number of seventy-five, and after visiting the displays on exhibition, gathered round the music stand and were called to order by the Hon. John J. Henry, who introduced W. B. Ewer, of San Francisco, who spoke as follows on "The industries of California."

Mr. President, Ladies and Gentlemen:—It has been truly said that one of the most extraordinary and attractive phenomena connected with the history of man is the co-operative action of the human mind, upon any prominent problem of the hour, whatever that problem may be. And just now the rapid growth of American industry seems to be the theme upon which attention is most fixed, and which is leading to the development of some of the grandest and most powerful of our intellectual forces, as well as challenging the admiration and astonishment of the civilized world.

As we contemplate the rapid development of our various industries, the constant increase of our population and wealth, the continued multiplication of our great brotherhood of States—united not only by strong political ties, but also bound together by the still stronger bonds of social and civil law a community of interest, made, in fact, one great neighborhood, by means of railroads and the telegraph—we at once recognize in our midst the presence of a vital, industrial and commercial force, stronger than law and more powerful than armies—a neighborhood between the individuals of which no rival or discordant complications can exist.

By our system of cheap manufacturer of the East a[re] goods at the door of his c[ustomer] South sooner than fifty ye[ars] transfer them to the extreme [East] or county. In the same man[ner] cility the producer upon the [Pacific] of the West and South can [transfer] products of the table or home of the Western manufacturer. By the aid of railroads and other rapid transit there is either a local or a distant market for every manufacturer, and there is the same for every producer—each can choose his own convenience or profit. We are a people who can live within ourselves, and almost independent of the outer world; and more than that, we have enough to spare to clothe the needy and feed the hungry wherever they may be found.

The great secret of the rapid growth of American industry is the railroad and the telegraph, backed by that indomitable energy and enterprise which is born only of free institutions.

America, born but yesterday, is teaching the Old World—which boasts of its thousands of years of age and progress—a lesson, which, however much it may be disinclined to receive, nevertheless cannot ignore—that free, self-reliant, well-paid labor, the citizenship of a republic of human equality, lies at the very foundation of individual progress and national greatness.

True, it is a great thing in the way of progress to have a broad and extended country in which to work out the problems of national greatness, but it is a greater and more fortunate thing that our fathers have bequeathed to us a country and a government whose institutions offer equal protection to all—a land where the industry and labor of the people is regarded as a more substantial wealth than the richest rewards of conquest.

Friends, have we not good reason to be proud of the institutions of a country which have made possible such results as we see everywhere around us? Let us then still be up and doing. Let us discourage and cast out the idlers. You of Colorado have set a glorious example of industry, thrift and progress during the last year, and it is well that we of other States should meet you here on such an occasion as this to congratulate you and to take heart ourselves for the work we have yet to do.

Go on with your glorious work. Continue to open up your lands. Bring in the blessed waters wherever they are near to reclaim the desert, and make it blossom like the rose. Continue to erect mills and factories. Let the forge and the furnace fires light up the darkness of night. Open up your mines more and more, and delve deeper and deeper into the earth to bring up the precious metals which furnish the sinews of commerce, and the iron and coal which lay at the very foundation of commercial prosperity. Extend your already numerous railroads; continue to bore through your rugged mountains, and hang your iron rails still higher, if need be, from your overhanging cliffs, until every mountain fastness and valley is brought into easy communication with your great commercial centres. I know from what I have seen since I have been here that there is no obstacle which human ingenuity can overcome that can stand in the way of Colorado's enterprise, or make her halt one instant in her onward march to a great and brilliant future.

I came here, Mr. President, to represent my State at this great Industrial and Mining Exposition, and to write my impressions for the benefit of California readers. Previous to my coming I had heard more or less of Colorado and her mines. I had also heard something of your city of Denver, but I had formed no adequate conception of the magnitude, the resources of the possibilities of either. If I was surprised on my first arrival, I have been more than surprised at what I have seen and learned during the short time I have spent here. When I look around upon your beautiful city, its elegant buildings, public and private; when I observe the substantial character of their material and construction, the architecural skill and taste displayed, and especially when I first entered and beheld the interior of your magnificent temple dedicated to the muses, and overflowing with the fruits of cunning workmanship, I was at a loss which most to admire, the perfection of the work itself or the relation which it bears to the social, civil and pecuniary condition of the people whose munificence has erected it, and whose continued patronage sustains it.

I have seen cities grow up in the great West and in California. Have witnessed, from its very beginning what we have considered the wonderful growth of the city of San Francisco; but allow me to say that when that city reached twice the present population of Denver, it bore no comparison in actual beauty and permanence to what I see around me today.

But, if I was astonished at what I first saw in your city I was more than astonished when I came out to your Exposition. I had expected to see here a magnificent building; but was not prepared to meet with such an exhibit as is made here—especially of your mines and minerals. I have lived in California since '49, and have been familiar with her mines and minerals. I have seen them at the mine, at the mill, and on exhibition, and have felt proud of the display they made. We have now in San Francisco a permanent museum of minerals, open and free to all, to examine and study. They have been collected at great expense. They are elegantly displayed in cases, well and scientifically arranged. They would have been a fine addition to your exhibit if they could have been brought here. But there was no one to cut the red tape which held them to their legal *status*. But that display, full and beautiful as it may be, is very far from so meeting the need of a practical mining exhibit, as does the one you have spread before us. Ours is not, like yours, a massive, striking, characteristic exhibit of the mines as they are. During my first two or three visits to this building it seems as though I was wandering about in some veritable Golconda—that I was realizing in fact some of the wild dreams of my early mining life—gold and silver and precious stones all around me, and in such profusion too! Mammoth masses of rich and beautiful ores in every variety in which nature combines them in her deep and most secret laboratories. Again I seemed to be in some rich and wonderful mining camp, with huge ore dumps of the richest rock on every side; thousands of miners down below breaking out and sending to the surface bonanzas of wealth, with the noisy mills and fiery furnaces out yonder taking out the precious metals, seemingly in quantities sufficient in a little while to pay off the national debt.

[illegible]

—better than all that was ever written upon the subject, because we have here the living tongue and the practical evidence and demonstration of that which we would learn. I know from experience that one may learn more in this building in three weeks than can be acquired in many months of travel and study among the mines themselves; for we have here intelligent men, well posted in all the local peculiarities of their several districts, through whose assistance the visitor is enabled to study the different characters of the ores, and the peculiarities of their geological conditions and surroundings as well. The visitor is also enabled to inform himself here quite fully in regard to the various mill and furnace processes employed in the reduction of the ores. This Exposition is in fact one of the grandest steps in the onward march of mining industry that has ever been taken in any part of the world. The world has never before seen anything like it, and probably never will again outside of Colorado.

Again, ladies and gentlemen, this Exposition and other similar ones throughout the world, and this industrial convention which is now assembled in your city, and other conventions like it, are teaching the world another most important lesson, outside of the direct object they have in view. They are teaching Kings and Emperors and magnates of every degree that the time is rapidly approaching when the struggle for national supremacy will no longer be determined by the conflict of arms. Questions of national and inter-national importance as well, will soon be decided by the united action of the shop, the counting-room, the factory, the mine, the forge and the farm. The captains of industry, the wise and earnest men of the industrial world, are fast taking hold of many of these questions, they are taking them out of the hands of mere politicians and professionals; they are already marshaling their forces for the coming struggle; some of them are here to-day, and they are earnest workers, too. They are sending out their skilled men to reconnoiter the works of whatever enemy may seem to stand in the way of industrial progress. They are sending out men to compare the skill and resources of every country with those of their own. You will find them at one time in Paris, at another in London. They have been to Vienna and Berlin. In 1876 I met them by thousands in Philadelphia. To-day they are coming to Denver, to learn here of your wonderful resources of field and mine and shop. They go down into your mines; they peer about among the labyrinthine mazes of this Exposition building. They go to your foundries, to your factories, to your workshops, and wherever else they can get an insight into whatever may be important or new to be learned in the way of making one nation independent of another and most fit to survive his neighbor. They will take away with them full details of all they can see or learn in relation to the skill and economy of the industrial establishments which they may visit. It is thus that nations are teaching by example and learning of one another, and woe be to that nation which assumes to be wise in its own conceit, or which knows too much to learn of another.

I have been asked to say something of the industries of California. If I have not already consumed too much time or wearied you with my many words, I will ask your indulgence for a few minutes longer for that purpose.

I suppose you have all heard of California and of a city down by the Golden Gate called San Francisco. You have also heard of the mines of California, even if they do not make a display here. And right here allow me to say that California's conspicuous absence from your exhibition is not because she did not appreciate the nature or importance of the work you are doing; neither has she been unmindful, in any respect, of inter-State courtesy. Let me assure you, Mr. President, and I trust this audience will believe me, when I say that no such idea has kept her away. The red tape matter, already alluded to, and the utter impossibility of getting up a proper exhibit from any other source than the State Museum, within the time allotted, was the sole cause why there is not a mineral exhibit here from the Golden State.

[Continued on Page 204.]

CHICAGO **FRASER & CHALMERS,** ILLINOIS

MANUFACTURERS OF IMPROVED AND APPROVED FORMS OF

MILL AND MINE MACHINERY.

Having made extensive additions to our Shops and Machinery, we have now the LARGEST and BEST APPOINTED SHOPS in the West. We are prepared to build from the Latest and Most Approved Patterns,

QUARTZ MILLS

For working gold and silver ores by wet or dry crushing. The Stetefeldt, Howell's Improved White, Brunton's & Bruckner Furnaces, for working base ores. Rotary Dryers, Stetefeldt Improved Dry Kiln Furnaces.

SMELTING FURNACES,

Water Jackets, either Wrought or cast iron, made in sections or one piece, either round, oblong, oval or square. Our patterns most extensive in use. SPECIAL FURNACES FOR COPPER SMELTING. Slag Pots and Cars, improved form. Bullion and Copper Moulds and Ladles, Litharge Cars and Pots, Cupel Furnaces and Cars.

HOISTING ENGINES Large or Small for flat or round rope. Double Cylinder Engines, from 6x10 to 18x60. This latter size furnished J. B. Haggin for Giant and Old Abe Co., Black Hill also Corliss Pumping Engines, 26x60, for Hoisting and Pumping Works, for 2,000 feet deep. **Baby Hoists for Prospecting, 4 H. P. to 6 H. P.**

Wire Rope, Safety Cages and any Size and Forms of Cars.

Principal Office and Works, Fulton and Union Sts., Chicago, Illinois.

Frue Ore Concentrator, or Vanner Mills.

Coarse Concentrating Works, Improved Jigs, Crushing Rollers, Sizers, Trommels, Rittenger Tables, and all other adjuncts for the proper working of Gold, Silver and Copper Ores, complete in every detail.

HALLIDIE IMPROVED ORE TRAMWAYS. We refer to Gen. Custer mine, Idaho, 5,000 feet long; Columbus Mine, Col., 4,750 feet long; Mary Murphy mine, Col., 5,000 feet long, all in constant operation.

LEACHING MILLS,

Improved Corliss and Plain Slide Valve Meyer's Cut-off Engines.

CORLISS ENGINES from 12x36 Cylinders to 30x60. PLAIN SLIDE VALVES from 6x10 to 36x36. BOILERS of every form, made of Pine Iron Works C. H. No. 1 Flange Iron, or Otis Steel. Workmanship the most careful. All Rivets Hand Driven.

McCaskell's Patent Car Wheels and Axles—Best in Use.

New York Office, Walter McDermott, Manager, Room 32, No. 2 Wall St.

INGERSOLL ROCK DRILLS

AND

AIR COMPRESSORS

Mining Machinery.

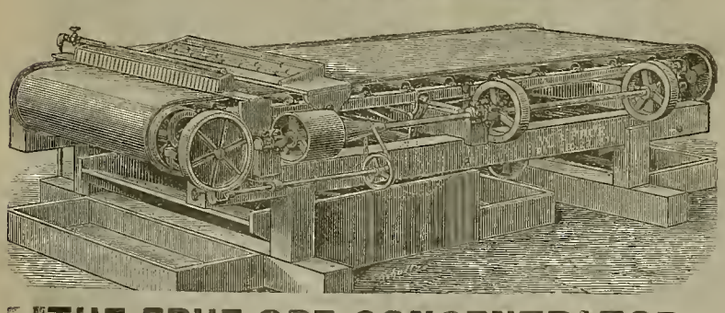
For Catalogues, Estimates, Etc., address

Berry & Place Machine Company,

PARKE & LACY, Proprietors.

323 & 325 MARKET ST., SAN FRANCISCO.

$1,000 CHALLENGE!



THE FRUE ORE CONCENTRATOR.

Nearly 300 are now in use, giving entire satisfaction. Awarded First Premium and Silver Medal at the Industrial Fair for 1880 of the Mechanics' Institute of San Francisco, Cal.

Saves from 50 to 100 per cent. more than any other Concentrator in use, and concentrations are clean from the first working. The wear and tear are merely nominal; water required is less than in any other wet Concentrator; the power required per machine is less than one-half horse power; the labor required is light, one man on a watch can attend to sixteen machines.

We challenge any other Concentrator in use for a fair and impartial competitive trial, side by side, for stakes of $1,000 each, and we mean business.

☞A machine with all improvements can be seen in working order and ready to make tests, at the office of Huckley, Spiers & Hayes, 220 Fremont street.

ADAMS & CARTER, Agents, Room 7 No. 109 California Street, S. F.

Colorado Iron Works,

MANUFACTURERS OF

ENGINES, BOILERS, RAILWAY CAST AND WROUGHT WORK, BRIDGE WORK, BOLTS AND BOLT ENDS, BUILDING WORK, ETC.

MINING MACHINERY A SPECIALTY.

Our manufactures of mining machinery embrace every kind of machine and appliance for the mining and reduction of ores.

We have had an experience of more than twenty years in the manufacture and practical operation of mining machinery in Colorado and the neighboring States and Territories.

Our facilities are superior to those of any manufactory in the West, our works having been recently rebuilt, greatly enlarged and completely equipped.

We invite the investigation of mine owners and mill men seeking machinery. We can furnish, on board at our works, or set up at the mines anywhere in the Rocky Mountain region, on short notice, the following machinery: Cornish Pumps, Steam Pumps, Stamp Mills for Wet or Dry crushing, Pans, Settlers, Agitators, Retorts, Bullion and Ingot Moulds, Reverberatory Furnaces, Bruckner Cylinders, Revolving Roasting Furnaces and Dryers, Melting Furnaces, Concentrating Machinery, Rolls, Crushers, Conveyors and Elevators, Ore Samplers and Grinders, Hoisting Engines, Water Jacket Furnaces, Slag Pots and Cars, Lead Pots and Ladles, Blast Pipes and Water Tuyeres, Blowers, Cupellation Furnaces, Market Retorts, Wire Rope, Cages, Buckets, Skips, Ore Cars, etc. Estimates furnished and prices quoted on application. Send for illustrated catalogue.

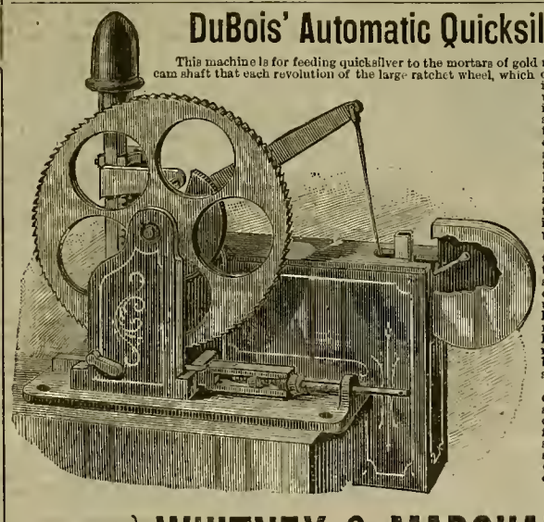
No. 310 California Street, - - - SAN FRANCISCO.

DuBois' Automatic Quicksilver Feeder.



This machine is for feeding quicksilver to the mortars of gold mills. It is so connected to the cam shaft that each revolution of the large ratchet wheel, which can be regulated to revolve once in one, two, three or four minutes, as desired, dips a small cup into a reservoir of quicksilver, and by a trip of the cam, empties the contents into a pipe leading down to the mortar, supplying an exact quantity at regular intervals, superseding the ordinary hand feeding, which is of necessity subject to great irregularity, and liable to neglect. It renders the amalgamation of all the gold in the pulp equally certain and perfect.

The mechanism to produce this depression and elevation of the cup, is driven by the cam shaft, similarly to the self-feeders, over which so much ingenuity has been expended to regulate the delivery of ore to the mortar. As it is to be desired to have the ore go in constantly and regularly, so it is equally desirable to have the mercury fed constantly and regularly.

A chief point of excellence of this machine is, that it allows the quantity of mercury which would be otherwise fed in mass, in one hour, to be subdivided into a number of small portions, and fed almost continuously; *i. e.*, from every one to four minutes.

Price, complete, $75.

For Sale by **WHITNEY & MARSHALL,** Sole Agents
22 & 24 Fremont St., San Francisco.
Dealers in Iron, Steel, Hardware and Mining Supplies, Wrought Iron Pipe and Fittings, Pump Columns, Wire Rope, etc. A large stock of Boiler, Plate and Sheet Iron of every description.

STEEL CASTINGS

FROM 1-4 TO 10,000 lbs. WEIGHT.
True to pattern, sound and solid, of unequaled strength, toughness and durability.
An invaluable substitute for forgings or cast-iron requiring three-fold strength.
Gearing of all kinds, Shoes, Dies, Hammerheads, Crossheads for Locomotives, etc.
15,000 Crank Shafts and 10,000 Gear Wheels of this Steel now running prove its superiority over other Steel Castings.
CRANK SHAFTS, SHOES, DIES and GEARING specialties.

Commissioner Ewer's Address.

[Continued from Paoa 201.]

California entertains the best of feelings to ward Colorado, and is to-day taking an earnest interest in your exhibit, and why should she not? For your city of Denver is the best customer for her produce this side of Liverpool, the city of New York possibly excepted. Your merchants pay to San Francisco sooiewhere about six millions of dollars annually for fruit and the various other kinds of our agricultural products which you consume here. That is the price, too, paid in San Francisco, to which must be added at least one and a half millions more, which is paid for transportation to our two railroads —the Central and Southern Pacific. Would California or any otber State do anything to endanger such a business? It is not at all likely she would. No, gentlemen, California rejoices in the prosperity of Denver and of Colorado, and she is stretching out her two giant arms of steel upon the northern and southern borders of your State to enfold you in an honest embrace, and noi to beguile or dishonor you. Your prosperity is her gain. She is io hearty sympathy with you in every enterprise which adds to your prosperity, and especially in support of your favorite measure of bi-metallism—while you furnish the silver, she will furnish the gold. And let it be remembered, too, that Colorado and California furnish about one-half of all the gold and silver which annually enters into the currency of the world. Colorado, located midway of the continent, occupying the very crest of the Rocky Mountain divide, from whose eternal snows the water flows east and west to the two great oceans of the globe, is attracting more attention at this time in the industrial world than perhaps any other section of the country, and justly so, for by your industry and enterprise you have risen to the front rank in the production of the precious metals, while California gracefully takes a back seat. For such is commanded by the stern logic of events. But Califoroia is winning other laurels. She can point [illegible] in that record and allow her younger sister, just now the pet of the family, to step forward into the front rank as a bullion producer, while the elder and more sedate sister is cumbered with many cares, and gives her more special attention to some of the other departments of her vast business operations. California is gradually going out of the bullion business, and is just now very busy in furnishing the world with a first-class article of wheat and flour. Her farm is a very large one. As an evidence I may cite the fact that it takes a good-sized river steamer to carry up the empty sacks to receive the wheat grown on a single one of her fields, that managed by Dr. Glenn, of Colusa County.

For many years after the advent of the gold seekers in Califoroia, it was generally thought that we should have to depend upon Chili or Oregon for our breadstuffs and fruit. But the marvelous growth of our agricultural interests since 1858 forms one of the most wonderful chapters of industrial progress ever written. Since that time there has been an almost constant increase in every department of agricultural products. Last year California had over one million tons of wheat to spare beyond her own need for consumption. Some 600 large ships were employed in carrying this surplus to market to the owners of which over $16,000,000 was paid in freight. The wheat netted to the produce ers about $37,000,000. The possibilities in this direction are almost unlimited. Let me convince you.

The great central valley of California, watered by the twin rivers—the Sacramento and the San Joaquin—contains about fifteen millions of acres, mostly the deepest, richest land in the world. True, a small portion needs reclamation from the waters, while another small portion needs irrigation facilities. Both classes of improvements are being gradually carried out. This vast area has been surrounded by nature herself with a single enclosure—the snow-clad Sierras and the ocean-washed Coast Range form its eastern and western boundaries, while the two join their own huge bulks on the north and south to form one of the grandest valleys on the face of the earth. Of these fifteen millions of acres, not more than three millions are cultivated at the present time. If this valley was thoroughly reclaimed and irrigated, as in time it will be, and divided up into small farms for thorough cultivation in fruit, vegetables, etc., with a convenient market, it would be capable of giving employment to and sustaining the total present population of the entire Pacific Coast west of the Rocky Mountains, including the whole of Colorado. And yet this area does not include one-half of the agricultural land of the State.

Our wheat product must, of course, be confined to a moderate rate of increase. But for fruit, both temperate and tropical, and for wine, olives and raisins, our market is practically unlimited, and our possibilities almost beyond computation. In no part of the world can those products be raised cheaper, quality considered, than in California. Our raisins have been pronounced equal to the best from the Mediterranean, while our wine is now received with high favor even in Europe. A full cargo of California wine was recently cleared for a European port, and more or less is constaotly going forward.

I regret that I have no time to make a proper reference to our manufacturing industries. They are unlimited, both in extent and variety. We have in San Francisco the largest sugar refinery in the world, and I believe also the largest woolen mill, where the finest blankets in the world are made. Woolen mills are springing up all over the State, and the indications are that we shall soon be able to ship nearly, or quite all, our wool as manufactured goods. A large cotton factory has recently been projected, and from experiments made on quite an extensive scale, it is confidently expected that we shall soon be able to grow our own cotton, and perhaps ship a surplus. That already produced is of better quality than can be raised in any of the Southern States from the same seed. Of our foundries and rolling mills I need not speak. They speak for themselves all over California, Nevada, Utah, in the Black Hills, in Arizona and New Mexico. We are also just beginning to produce our own iron, the very best quality of iron ore being found in abundance in the immediate vicinity of timber for charcoal and lime for flux.

In all the minor articles of manufacture California is making rapid and most satisfactory progress. The increased value given to raw products by manufacturing labor in 1881 was $37,000,000. And yet California is but just commencing business in this direction. Of our commercial status and possibilities I have no time to speak at length, but let me say they are grand indeed. And now, Mr. President, I will close by saying that the mining interest of California, great and important as it is, is but a minor issue when taken in connection with the greater and more important work of developing and building up the great agricultural, manufacturing and commercial interests which we just now have so steadily in hand. Our quartz mines and our placers will continue to be worked for a century to come, and annually add their $20,000,000, more or less, to the value of the precious metals of the world. California, like Colorado, has bonanzas in her plains and valleys, as well as in her mountains. Her land is everywhere teeming with plenteousness of every product, both mineral and vegetable.

In no State does the grain grow higher, stouter or better; the reaper's hand is nowhere fuller; nowhere does the soil produce more bushels to the acre, more stalks to the seed, or more kernels to the head. Our flocks and herds are seen on every hill and in every valley. Our orchards are bending beneath the heaviest loads of the richest fruits. The wealth and richest of the tropics are at our doors, and our fields and gardens abound with every vegetable product which the heart can desire. In California we have no Winter to linger in the lap of Spring or to eat up the profits of Summer. Six months of unbroken sunshine are given in which to secure the crops with which a Winter of vernal softness has clothed our fields. If we sow we are sure to reap, and as often as any way we reap without sowing at all. Labor in California brings no stiffened limbs, no premature old age. No other land beneath the blue vault of heaven exhibits greater proofs of God's special favor to man than is seen in our own chosen California home.

The Coming Transit of Venus.

Extended preparations are being made to observe the transit of Venus on the 6th of December, and there is now a party in this city on the way to Australia to make observations.

Prof. George Davidson, of the United States Coast Survey, and President of the California Academy of Sciences, some time since applied at Washington to take charge of a party to observe the transit of Venus at some point on the Andes, where, at a hight of 12,000 ft., there was a prospect of fair weather; but when informed by Prof. Simon Newcomb, President of the Commission, that he would be stationed on the east coast of Patagonia, at a low elevation, with a very poor chance of good weather, he withdrew his offer. The President of the Commission then addressed to him a letter asking whether he would take charge of a party in New Mexico. He accepted this proposition, and, on his way to California, recently, examined the country along the line of the southern railroade, and reported in favor of a mountain called Cerro Rohlero, on the right bank of the Rio Grande del Norte, about 20 miles south of the Southern Pacific Railroad station Rincon.

This station lies about 15 miles southwest of Fort Selden, which is now to be made a 12-company post. At this point the broad plateau of the southern extension of the Jornada del Muerte (journey of death) stretches toward the Organ mountains, 25 miles distant, and rising in grand columnar peaks to 9,000 ft. above the sea. At Cerro Rohlero the elevation is 5,575 ft. above the sea, and 1,675 ft. above the river. It is difficult of access and destitute of wood and water. But a trail can be built there, and wood and water packed five miles from the river.

At this station the sun will be about 4½ degrees high in the east at the time when Venus is making the first internal contact with the limb of the sun. All other stations limit their positions to where the sun will be 10 degrees high at that contact. Such a station is San Antonio, Texas, the other southwestern station of the United States.

According to meteorological statistics the chances of clear weather at San Antonio are only one or two, whereas, it is reported, at Fort Selden and the region round about the observers may expect almost continuously clear weather at that season, and that the mornings are specially clear.

In recommending this most westerly of the northern hemisphere stations, Prof. Davidson was governed by the favorable prospects of clear weather, and a firm conviction that at such an elevation the outline of the sun will be favorable to distinct outline of the sun's disk, and the consequent freedom of that great bugbear "black drop" and "ligament."

He proposes to transport his six and one-third inch equatorial, with the portable observatory, to Summit station, on the C. P. R. R., placing the operations under the charge of J. J. Gilbert, of the U. S. Coast Survey Association, with other officers who have volunteered. The instrument has been furnished with a double-image micrometer by Alvan Clark, and although the first and second contacts of Venus with the sun's limb will not be there visible, for the sun will be below the horizon, yet the last two contacts will be visible, and micrometric measures of the distances of the two limbs, as the bodies approach, will be of great value. The meridian transit and zenith distance of the planet on the sun's disk will also be observed.

In selecting Summit station, of 7,150 ft. elevation, rather adverse chances of good weather are taken; but if it is clear, the sky will be remarkably favorable for observations. At all events, the chances of good weather are as good as at San Francisco station.

Should the weather along the Atlantic coast be unfavorable on December 6th, a very great disappointment will await the numerous observers who are associated with college and private observatories, as well as the U. S. and foreign observers. A December storm will stretch along the whole seaboard, and involve the principal line of the observations.

Prof. Davidson has promised to present to the Academy a popular paper explaining the method of observation, and the broad principles which underlie the whole problem of determining the distance of the earth from the sun by these observations.

At the last meeting of the California Academy of Sciences, the Secretary read a letter from President Davidson, inclosing one from Prof. Simon Newcomb, LL. D., Superintendent of the American Ephemeris at Washington, detailing the names of observers, and their 42 stations in the northern and southern hemispheres, appointed by foreign governments to observe the coming transit of Venus, on the 6th of December, 1882. The following list is incomplete, but correct as far as present data can determine. Many other parties not yet organized will be sent out:

England—Jamaica—Dr. Copsland, Captain Mackinley, R. A., Mr. Maxwell Hall. Barbadoes—Mr. Talmage, Lieutenant Thomson, R. A. Bermuda—Mr. J. Plummer, Lieutenant Neate, R. N. Caps Observatory—Mr. David Gill, Mr. Maclsar, Montague road. Cape Colony—Mr. W. H. Finlay, Mr. Pett, Aberdeen road. Caps Colony—Mr. A. Marth, Mr. C. M. Stevens. Madagascar—Father Perry, Father Sidgreavss, Mr. Carlisle. Durban, Natal—A telescope has been provided by the colonists. Mauritius—Mr. Meldrum. New Zealand—Lieutenant-Colonel Tupman, R. M. A., Lieutenant Cook, R. N. Brisbane—Captain Morris, R. E., Lieutenant Darwin, R. E., Mr. Peck. Melbourne—Mr. Ellery and staff. Sydney—Mr. Russel and staff.

France—Cuba, D'Abbadie; Martinique, Tisserand; Florida, Perrier; Mexico, Baquet de la Grye; Chile, Le Clerc; Santa Cruz, Fleurais; Chulnt, Hati; Rio Negro, Perrolin.

Brazil—Itapeva, Pernambuco, Rio Janeiro, Antilles, Straits of Magellan.

Germany—Argentine Republic. Straits of Magellan or Falkland Islands United States, (two stations).

Spain—Cuba (2), Porto Rico.

Holland—Curacoa or St. Martin.

Portugal—Lorenzo Marqoez.

Mexico—Chapultepec.

Argentine Republic, two stations—Boeuf.

Chili—Santiago.

Denmark—St. Thomas or Santa Cruz.

The Cost of Milling Ore.

The Pinal *Drill*, of Arizona, has the following in regard to milling ores and reduction machinery: A great many changes have taken place within the past four years, but none so noticable, perhaps, as that of milling ore. The fact of having the free gold ores treated in a 20-stamp mill during the year 1877 was $20 per ton. In 1878, it was reduced to $6 per ton. In 1879, it was reduced to $4 per ton, and at the present time it is in some districts only $1.25 to $1 50. At this reduced figure, by using the desired economy, there is a profit of about 35 cents, and with modern attachments the profits will be something like 55 cents per ton on the lowest grade of ore worked. From the above figures it appears that the milling is the most expensive operation connected with the low grade of ores, but it is mainly due to the cost of transportation and the manner of handling the ores, providing all things are equal. The stamp may yet be considered but little beyond its infancy, as are at present all processes connected with the reduction of ore. There is little doubt that every year will see improvements brought out tending to the more economical workings of all descriptions of ore. It is but 20 years since this country began to produce silver on a large scale, and the problem of extracting that ore at a reasonable price when found in conjunction with base and rebellious metals, has yet to be solved. It is a problem which involves thousands of millions of dollars. Hundreds of minds are constantly working on it, and its solution is only a matter of time. When that time comes, fresh life will be infused into districts which now lie idle, and great cities will spring up in deserts which are now abandoned to the vulture and coyote.

The Eagle box factory, Oakland, was established February, 1880, on the corner of Second and Grove streets, by McIntire, Abbey & Co. They have 45 hands employed, and work up about 10,000 ft. of lumber per day, making on an average 2,000 boxes of all kinds for the trade. They use the best seasoned material, and their boxes are equal to any in the market. They also manufacture patent egg carriers, work about 1,500 lbs. of pasteboard daily. These carriers are exported extensively to the southern trade, and the demand for them is increasing to such an extent as to make an enlargement of the factory necessary, and the employment of more hands.

The Union line steamship *Alaska*, from New York to Queenstown, made the run in 6 days, 18 hours and 37 minutes.

Patents and Inventions.

List of U. S. Patents for Pacific Coast Inventors.

From the official list of U. S. Patents in Dewey & Co.'s Scientific Press Patent Agency, 252 Market St., S. F.

For the Week Ending September 12, 1882.

264,236.—Pencil Sharpener—H. Burgess, Berkeley, Cal.

264,152.—Bark-Cutting Machine—J. C. Haggerty, Santa Cruz, Cal.

264,157.—Child's Carriage—W. A. Hepburn, S. F.

264,164.—Wind Wheel—P. H. Jackson, S. F.

264,175.—Paper File and File Holder—J. H. Linney, S. F.

264,090.—Stove Grate—W. H. Loomis, Alameda, Cal.

264,413.—Rope Railway—J. B. Low and A. K. Grim, S. F.

264,182.—Removing Scale in Steam Boilers—I. L. Merrell, S. F.

264,183.—Harrow—J. Mewhinney, Pomo, Cal.

264,184.—Refrigerator—Jas. Miller, Oakland, Cal.

264,185.—Refrigerator—Jas. Miller, Oakland, Cal.

264,186.—Refrigerator—Jas. Miller, Oakland, Cal.

264,187.—Refrigerator—Jas. Miller, Oakland, Cal.

264,338.—Pump Valve—C. C. Redmond, San Jose, Cal.

264,201.—Vehicle Brake—D. Shelton, Santa Rosa, Cal.

264,204.—Cartridge Loader, etc.—L. Sonntag, S. F.

264,361.—Gun Barrel—R. L. Stevens, Albany, Oregon.

264,332.—Double Oscillating Engine—R. L. Stevens, Albany, Oregon.

264,363.—Gravity Steam Engine—R. L. Stevens, Albany, Oregon.

264,265.—Fruit Drier—Jas H. Street, S. F.

264 376.—Beehive—M. Van Ensley, McMinnville, Or.

10,196 —Seed Dropper—F. W. Young, Santa Rosa, Cal. (Reissue).

10,197 —Seed Dropper—F. W. Young, Santa Rosa, Cal. (Reissue).

264,135.—Horse Rake—Geo. W. Burrier, Lyon county, Nevada.

Note.—Copies of U. S. and Foreign Patents furnished by Dewey & Co. in the shortest time possible (by telegraph or otherwise) at the lowest rates. All patent business for Pacific coast inventors transacted with perfect security and in the shortest possible time.

Notices of Recent Patents.

Among the patents recently obtained through Dewey & Co.'s Scientific Press American and Foreign Patent Agency, the following are worthy of special mention:

Harrows.—John Mewhinney, Pomo, Mendocino Co., Cal. No. 264,183. Dated Sept 12, 1882. This relates to that class of harrows in which the teeth are fixed in rocking bars or shafts, and it consists in a new and useful means for working the said bars to change the inclination of the teeth, and cause the harrow to clear itself.

Refrigerator.—James Miller, Oakland. No. 564,186. Dated Sept. 12, 1882. This patent consists particularly in a water vessel set within a shallow dish, and containing a holding vessel set therein on legs, and smaller in diameter, whereby a space is formed around and under said vessel, and in a peculiar cap or cover to supply said space with water.

Child's Carriage.—Ward A. Hepburn, S. F. No. 264,157. Dated Sept. 12, 1882. This attachment to child's carriages consists of a supplemental seat, which is hung between the guiding handles of the carriage by elastic supporting bands, or hangers, so that, while the body of the vehicle is occupied by one child, another may be placed in the seat.

Refrigerator.—James Miller, Oakland. No. 264,185. Dated Sept. 12, 1882. This improvement consists particularly in a deep vessel, with vertical sides, provided with a centrally perforated false bottom, upon which a holding vessel of smaller diameter, and extending above the exterior vessel, is placed, whereby a surrounding and underlying water space is formed. It further consists in the provision of an air-tight cover for the holding vessel.

Refrigerator.—James Miller, Oakland. No. 264,187. Dated Sept. 12, 1882. The fourth of these patents to this inventor consists particularly in a deep water vessel, having placed within it a tapering water vessel set on legs, and of a diameter smaller than that of the exterior vessel, whereby an underlying and circumscribing water space is formed, and in a peculiar water-supply vessel, fitting in the top of the larger vessel.

Combined Paper File and File-holder.—John H. Linney, S. F. No. 264,175. Dated Sept, 12, 1882. This invention relates to a new and useful paper file and file-holder, and it consists in the employment of two peculiar clamping-rods, hinged together at one end, and secured by an automatic clasp at the other, and having an intervening spring pad. These parts are adapted to rest in a grooved adjustable top of a stand, which is provided with an upright arm, furnished with a hook for holding up the upper swinging rod for the convenient insertion of the paper.

Apparatus for Capping, Uncapping and Loading Cartridge-shells.—L. Sontagg, S. F. No. 264,204. Dated Sept. 12, 1882. This invention relates to an apparatus for performing the work of crimping, capping, loading and decapping cartridge-shells. It consists of a holder for the cap and shell, and a lever by which the cap is seated, a block for setting the bullet after the powder has been introduced into the shell, a movable post with a pin, which may be brought beneath the lever after the discharged shell has been placed upon it, so that, by pressing down upon the lever, the cap will be forced off, and a device for crimping the open ends of the shells.

WIND-WHEEL.—Peter H. Jackson, S. F. No. 264,164. Dated Sept. 12 1882. The latest device of this skilled inventor, is an apparatus for producing power by means of the wind. It consists of a wheel, having radial floats mounted within a case having a funnel-shaped receiver to direct the wind upon the upper part of the wheel. The wind follows the close case around to the point of exit near the bottom, where it escapes into the discharge-flue. In front of this flue, and beneath the funnel which supplies the wheel, is a second funnel, having spirally-placed wheels within it. This funnel extends into the discharge-flue before referred to, so that there is a space all around it, and the action of the air-blast passing through this funnel, will produce a vacuum or draft through the wheel-case, which will assist in its revolution. The whole apparatus is mounted upon a vertical spindle, and has a vein extending in the opposite direction from the funnel openings, so as to keep them to the wind. The wheel-shaft may be connected in any suitable manner with a pump or other mechanism which is to be driven by it. Mr. Jackson, the inventor of this appliance, has received many U. S. patents on various devices, and is still inventing.

BARK-CUTTING MACHINE.—John C. Haggerty, Santa Cruz. No. 264,152. Dated Sept. 12, 1882. This machine is for cutting bark for tanners' use. The bark is fed so that it may be pressed against the face of a disk at an angle, and the disk being set in rapid motion, its knives will cut the bark into small fragments, which escape through slots, in which the knives stand into the rear part of the case, whence they fall through suitable discharge openings. The angle at which the bark is introduced facilitates a more rapid cutting than if introduced squarely or at right angles with the cutters, and it also assists to feed the bark in as it is cut. This particular cut given the bark leaves it in a shape in which the valuable portion may be more easily extracted than when reduced in any other manner.

REFRIGERATOR.—James Miller, Oakland. No. 264,184. Dated Sept. 12, 1822. This refrigerator consists generally in the construction and arrangement of peculiar vessels, providing for the holding of the substance to be kept cool a surrounding and underlying water space and a water supply. It consists particularly in a pan-like vessel, within which is set upon short legs a smaller vessel of smaller diameter and greater highth. Between these, a space is formed in which rests the base of a dome-shaped vessel with a flaring base, and provided with a cap. The object of the invention is to provide a simple and economical refrigerating device.

News in Brief.

THE damage by the floods in Italy and Austria is 2,000,000 florins.

A PELICAN that measured eight feet from tip to tip of wings, was killed in El Dorado county last week.

AN electric railway is to be one of the attractions and conveniences of Fairmount park, Philadelphia, soon.

MILLER & LUX proposed to stock the sloughs and ponds of the San Joaquin with fresh water eels from Holland.

THE Boston dry goods firm which sent some of its clerks to Europe this year is said to employ 3,000 people.

THE westward-bound trains on a Georgia railroad have carried over one million watermelons this year to Western cities.

THE Connecticut Supreme Court of Error has decided that women are eligible to admission as attorneys, and their sex is no bar.

A COUNTERFEIT silver half-dollar, made of babbit metal and glass, has been received by the Treasury Department at Washington.

THE Queen of England regards with satisfaction the fact that the tricycles which have been used by her grandchildren have helped their health.

A CONTRACT has been signed between the government of Portugal and Braam for laying a cable between Lisbon and the United States, touching at the Azores.

San Francisco Exhibit at the Denver Exposition.

Mr. E. G. Denniston, proprietor of the San Francisco Gold, Silver and Nickel Plating Works, 653 and 655 Mission street, is the only representative of the manufacturing interests of San Francisco or California at the Denver Exposition. Mr. Denniston is exhibiting his silver-plated amalgamating plates for saving gold. These plates are used with great success in quartz and placer mining. They are attracting great attention from Colorado and other miners visiting the exposition. Mr. D.'s trip has been very successful, he having secured quite a number of orders, with the best prospects of a large business in the future. Mr. Denniston will, before returning, visit most of the prominent mines of Colorado, New Mexico and the extensive mines in the Black Hills, D. T. From there a visit to Chicago and Eastern cities will be made for the purpose of visiting friends and making business purchases, one item of which will be a large electric machine for plating purposes, the increase in his business necessitating enlarged facilities.

Mr. Denniston's works are the largest and most complete on the Pacific coast, where every description of metal work is plated with gold, silver and nickel. The reputation of his work is widespread, particularly his silver-plated copper plates for saving gold.

Agents Now Wanted.

Extra inducements will be offered for a few active canvassers, who will give their whole attention (for a while at least) to our business. Apply soon, or address this office, giving address, age, experience and reference.

DEWEY & CO., Publishers,
No. 252 Market St., S. F.

Our Agents.

OUR FRIENDS can do much in aid of our paper and the cause of practical knowledge and science, by assisting Agents in their labors of canvassing, by lending their influence and encouraging favors. We intend to send none but worthy men.

G. W. MCGREW—Santa Clara county.
M. P. OWEN—Santa Cruz county.
J. W. A. WRIGHT—Merced, Tulare and Kern counties.
JARED C. HOAG—California.
B. W. CROWELL—San Luis Obispo and Santa Barbara counties.
H. H. MCDONALD—Solano and Yolo counties.
C. B. HUSE—San Joaquin and Amador counties.
J. J. BARTELL—Sacramento and Solano counties.
L. L. WOODMANSEE—Napa county.

Old Papers Wanted.

Twenty cents each will be paid for a limited number of copies of any of the following Nos. of the MINING AND SCIENTIFIC PRESS, if received soon at this office: No. 1 of Vol. 13, 1866; No. 5, Vol. 18, 1869; Nos. 1 and 26, of Vol. 20, 1870; No. 1, of Vol. 22, 1871. Also, 10 cents per copy for Nos. 2, 3, 4, 7, 10, 11, 12, 13 and 15, of Vol. 30, 1875. If any one who has files of back volumes of the PRESS, which they may like to dispose of at a moderate rate, will send us a memorandum of the same and the price, we may be able, sooner or later, to assist in their disposal.

Attend to This.

Our subscribers will find the date they have paid to printed on the label of their paper. If it is not correct or if the paper should ever come beyond the time desired, be sure to notify the publishers by letter or postal card. If we are not notified within a reasonable time we cannot be responsible for the errors or omission of agents.

For Sale.

A twenty-stamp steam mill, complete and almost new. Also, air compressors, drills and mining machinery. Anyone having a gold or silver mine warranting the investment, may buy this material on time by making monthly or quarterly payments. Address, CHARLES E. SHERMAN, Havilah, Kern County, Cal.

SAMPLE COPIES.—Occasionally we send copies of this paper to persons who we believe would be benefited by subscribing for it, or willing to assist us in extending its circulation. We call the attention of such to our prospectus, terms of subscription, etc., and request that they circulate the copy sent.

REMITTANCES to this office should be made by postal order or registered letter, when practicable; cost of postal order, for $15 or less, 10 cts; for registered letter, in addition to regular postage (at 3 cts. per half-ounce), 10 cts

ANNUAL STATISTICIAN of 1882.—"It is the most complete and accurate work of its kind in the world."—*S. F. Call.* Address L. P. McCarty, 502 Taylor st. Price, $4.

A TURNED LEAF will point out the article supposed to be of special interest to persons receiving sample copies of this paper.

HOW TO STOP THIS PAPER.—It is not a difficult task to stop this paper. Notify the publishers by letter. If comes beyond the time desired you can depend upon it we do not know that the subscriber wants it stopped. So be sure and send us notice by *letter*.

BY TELEPHONE.—Subscribers, advertisers and other patrons of this office can address orders, or make appointments with the proprietors or agents by telephone, as we are connected with the central systemin San Francisco.

Engraving. Superior Wood and Metal Engraving, Electrotyping and Stereotyping done at the office of the MINING AND SCIENTIFIC PRESS, San Francisco, at favorable rates.

NOTICE.

The old firm of MOREY & SPERRY, Manufacturers and Dealers in Mining Machinery, having been dissolved, a partnership has been formed between Eugene Sperry, Dudley S. Steele and Nathan W. Condict, Jr., under the firm name of SPERRY & CO., to continue the manufacture of and dealing in all kinds of Mining Machinery and Supplies for Mills and Mines.

MR. JAMES A. SPERRY, formerly of the firm of Morey & Sperry, whose experience extends over a period of 33 years, commencing in California in 1849, and embracing the western and southern sections of the United States, as well as Mexico and South America, will personally superintend the construction of the Machinery, and when desired, the erecting and starting of the same upon the ground.

The Machine Works and Foundry of MESSRS. STEELE & CONDICT in Jersey City will be especially at our service in filling orders, and we feel confident that our facilities will enable us to fill orders understandingly, promptly and at reasonable prices. Information and estimates will be cheerfully given.

NO. 7 IMPROVED

AIR COMPRESSOR.

SPECIAL ADVANTAGES.

Absolute certainty in the action of the valves at any speed. Perfect delivery of the air at any speed or pressure. The heating of the air entirely prevented at any pressure. Takes less water to cool the air than any other Compressor.

Power applied to the best advantage. Access obtainable to all the valves by removing air chest covers. Entire absence of springs or friction to open or shut the valves. No valve stems to break and drop inside of cylinders.

Have no back or front heads to break. The only Machine that makes a perfect diagram. No expensive foundations required. Absolute economy in first cost and after working.

DISPLACEMENTS in air cylinder perfect. Showing less leakage and friction than our competitors and a superior economy of about 20 per cent.

Small Sizes made in Sections not to Exceed 300 lbs.

GIANT POWDER.

MANUFACTURED UNDER ALFRED NOBEL'S ORIGINAL AND ONLY VALID PATENT FOR NITRO-GLYCERINE POWDERS.

All Nitro-Glycerine Compounds, for instance, so-called HERCULES, VULCAN, VIGORIT, NITRO-SAFETY Powder, Etc., are infringements on the Giant Powder Co.'s Patents.

THE GIANT POWDER COMPANY

Call Special Attention to their Improved Grades of Powder.

NO. 1.—The most Powerful Explosive Compound now in use here.
NO. 2.—Surpasses in strength any Powder of its class ever manufactured.
NO. 3.—This grade is a Strong and Reliable Powder, which does excellent work.

JUDSON POWDER

Is now used in all large Hydraulic Claims, and on most Railroads. It breaks much more ground, and obviates reblasting by breaking much finer. TRIPLE FORCE CAPS AND ALL GRADES OF FUSE.

☞The Giant Powder Company have also purchased from Mr. Nobel, the inventor of Nitro-Glycerine, his latest invention, known under the name of

NOBEL'S EXPLOSIVE GELATINE

This explosive is from 50% to 60% stronger than the strongest Nitro Glycerine Compound and impervious to wate. Even hot water does not diminish its strength. We are now introducing the same.

MINING AND SCIENTIFIC PRESS.

An Illustrated Journal of Mining, Popular Science and General News.

BY DEWEY & CO., Publishers. SAN FRANCISCO, SATURDAY, SEPTEMBER 30, 1882. VOLUME XLV Number 14

The Placer Diggings in New Mexico.

Moreno Mining District, Colfax County.

[Written for the PRESS by B. G. DAVIES.]

This district is in the Cimarron range of the Rocky mountains, a distance of about 53 miles from Springer (a railroad station on the A. T. & S. F. line). It has been and still is foremost in the rank of mining districts in the Territory. Discoveries and locations were made as far back as 1864, but no particular action towards its development was taken until the discovery of the enormous rich deposits in the Gronse, Hamburg, Nigger and Last Chance gulches in 1867, which gave an impetus to further researches, and subsequent bringing to light of other placer mines equally as rich. The lower portions of these gulches were worked out early with the waters of the Moreno; but having sufficient proofs of the richness of the higher portions of the gulches, a certain gentleman, Capt. Davies, 14 years ago, built a very large flume—42 miles in length—which cost him over $250,000, in its construction, to convey the waters of the Red river (of the Arroyo Hondo), in order to work out these placer mines. But after all, only a portion of the gulches could be worked out, even by this enormous flume, which portions are still in a very prosperous condition, and kept on in full working capacity for a season of eight months a year for the last 10 years, and could not be worked out thoroughly, by the present method, for the next 40 years. About three weeks ago I had an interview with the owner of these hydraulic mines—Mr. James Lynch—who made the statement that he cleared over $50,000 last season after paying all expenses.

Somewhere about two years after, Capt. Davies built his "big ditch." Mr. Maxwell, an old resident of Cimarron City built another large flume seven miles in length, in order to carry the waters of the Ponian river to be used to work the upper portions of these gulches; but after spending over $35,000 in its construction, failed to convey any water at all, on account of the porous character of the mountain-sides. Being of a volcanic formation, the water, instead of running through the ditch, percolated through the scoria earth, and was entirely absorbed before reaching the place where the mines are situated. On this account the upper portions of these rich auriferous gulches are still idle, except, indeed, a very little ganging done here and there by a few of the old fossils, who are only making a bare living by the operations of the most rude and primitive processes.

I have reference to one portion of these rich auriferous diggings in particular, which I visited last August. I was on the ground for three days, and by the permission of the owner, who is known in these mines all over by the cognomen of Italian Pete, made a thorough test of this gold-bearing wash-dirt. I was indeed permitted to sink holes here and there, and I drove two small short tunnels through the ground, which afforded me all the chances necessary to try the place. I panned out some dirt from off the bedrock close to the deepest part of the deposit, at the edge of the gulch; then two or three feet above the bedrock; then again from six to eight feet above the bedrock. Then I took carefully three different samples from each and every prospecting place that I dug, until I was quite satisfied that I put the ground through a very fair and crucial test, which allowed me to make a rough calculation of its *tesoro escondido*, and I consider five cents to the cubic foot of the whole ground the lowest estimation of its intrinsic value. Thus: 1,800 ft. long × 600 wide × 8 ft. thick × 5 cents = $432,000. Here there is a small fortune lying hidden in the ground, but there is not enough water in the gulch to bring it out, according to the present method, for the next 500 years. Several other very rich claims are on Gronse gulch—that of Greely's, Milton's, Irwin's, Ritchie's, etc., but have not sufficient water to work them, except about an hour per day, and for the remaining *twenty-three* they have to wait for the water to accumulate in the reservoirs; and here these poor miners live their apparently objectless lives in their humble log huts, excluded from society and the comforts of this world, year after year, with no ambition other than the privilege of existing. Now I ask any of the scientific men of San Francisco, is there any method, any process, any plan, any something by which the gold of these rich gulches could be taken out in a shorter period than by the present Methuselan-like mode. If a dam was built across the gulch in order to collect the water that already runs through it, would it be practicable to perpetually use the same water over and over again, by pumping it up to the reservoir? Would there be any difficulty caused by the obstruction of the tailings? Could this be rectified by constructing a brush-dam over a portion of the main dam next to the location of the pumps? The dry-washer cannot be made suitable to this kind of auriferous ground, I am afraid, on account of its clayey character and its moist nature.

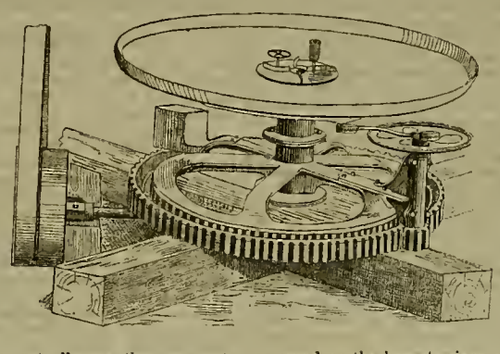

Fig. 2.

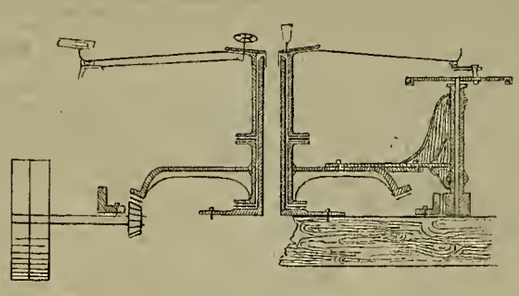

THE IMPROVED DUNCAN CONCENTRATOR.

ARTIFICIAL LIMBS.—Attention is invited to the advertisement of the Artificial Limb Manufacturing company, of Pittsburg, in another column. It is said every member of the company wears an artificial leg, and hence are competent to advise their customers as to the appliance best suited to their needs. They assure us that they employ the most skillful workmen in the manufacture of artificial limbs. Write for a descriptive circular to the office of the company, at 279 Penn avenue, Pittsburg, Pa.

IN the Wood River mining belt, from Bellevue to Galena, the greatest depth yet attained on any of the ledges, is about 300 ft., where they are larger and richer than on the surface. There are mines in almost all directions from Hailey—north, east, south and west, and nearly every ledge has some one taking ore from it, which will be shipped this fall.

WORK is pushed vigorously ahead in the mines and mill of the Twin River mining company at Ophir Canyon.

A FAITHFUL PUBLIC SERVANT.—The attempt to have James Crawford removed from the Carson mint resulted in a complete fizzle. On the investigation the complainants slunk away and refused to testify. It was a disgraceful attempt to besmirch the character of a faithful public servant.—*Mountain Messenger.* It would be well if all public officers were able to pass through investigation as well as the gentleman mentioned in the item. The writer knew him when he was a bedrock miner in La Porte, Plumas county, in 1860–3. No man in the community stood fairer than he; and there is no doubt that the Superintendent of to-day is as sound as the honest miner of twenty years ago.

THE Austin *Democrat* is creditably informed that Mr. Raphael, of Wadsworth and Downeyville, was offered $250,000 for his Downeyville mining property. The offer was made by Reuben Rickard, of the Victorine mining company, at Kingston. Mr. Rickard met Mr. Raphael at Reno and made him the above offer, which was promptly refused. Mr. Rickard, however, insisted upon Mr. Raphael accompanying him to San Francisco, which Mr. Raphael consented to, and it is believed that satisfactory terms will be arrived at, and that the property will be transferred at an early date.

PARTIES who went from Vienna, Idaho, to the Middle Fork of the Salmon river, where the great excitement about placer mines was raised last month, report the diggings a failure and a fizzle. They say of the bar prospected: "Sometimes a panful would go as high as 12½ cents, and again only five cents to the pan." If they call this a failure, we would like a few of that kind in California. Five cents a pan and plenty of water looks just the reverse of failure.

A LARGE car for hauling salt in bulk has been added lately to the rolling stock of the Carson and Colorado railroad. It is made after the pattern of the ore dumps, and is to be used for conveying salt from the works of the Nevada Salt and Borax Company, at Rhodes, to the quartz mills.

The Duncan Concentrator.

A machine for the rapid and effective concentration of all classes of ores, is a problem that has baffled the skill of the inventor for more than thirty years, and made more demands upon his ingenuity than any other class of machinery relating to the manipulation of mineral bearing ores. Vast deposits of low grade ore are known to exist in nearly every mining district, awaiting some cheap and effective mode of concentration to become sources of great wealth, while many rich gold mines, carrying a large part of their product in sulphurets, have been almost valueless, on account of the difficulty of eliminating them.

One of the machines intended to concentrate low grade ore is the Duncan Concentrator, shown on this page, and manufactured in this city by Rankin, Brayton & Co., of the Pacific Iron Works.

The machine herewith presented is simple in construction, automatic in its action, and combines all the requisites of a successful concentrator. It has been thoroughly tested on all classes of ores, and is now largely in use in various parts of the country, giving the most satisfactory results, especially so on ores carrying heavy sulphurets, which no other concentrator has been able to handle.

This machine has two motions—an irregular centrifugal and an oscillating. The centrifugal motion throwing the heavier or more valuable particles to the outer rim of the pan, and the oscilating, or shaking motion, causing them to settle to the bottom, where they are drawn out through a transverse opening and discharged by a spout attached to the bottom of the pan into a circular tank placed outside the gearing, while the sand flows to the center, through which it passes down and escapes. The pan, by its centrifugal motion (making, say nine full revolutions per minute), causes the pulp to flow around and over its surface about three full revolutions, or equal to a distance of some 30 ft., before it is discharged, thereby giving the finer, or heavier particles, sufficient time to settle before the refuse material passes off.

It is adapted to different grades of ore, by adjustable rings of varying hight, placed around the overflow, which, in connection with the opening given, the discharge gats determines the closeness of working and cleanliness of product. But little power and no skill are required to separate it. The cost is slight as compared with ordinary machines of the same capacity. Fig. 1 of the engraving is a perspective view, and Fig. 2 is a section of the machine.

A CHAIN-LIGHTNING DRIFT.—The drift now being run west from the Challar-Norcross-Savage shaft on the 2600 level is going ahead at a rate of speed that beats the old "lightning drift" of the Hale and Norcross. It was started about seven o'clock on the evening of Monday, September 11th, and Monday (18th) at seven o'clock it had been extended 100 ft., and on the 20th it was 120 ft. in length. As the station extends west 45 ft., this puts the face of the drift out 165 ft. In case the present ground continues, it is thought the drift can be sent along at the unprecedented rate of 20 ft. per day. This seems almost incredible when we consider that the drift is eight ft. wide and sight high. The great width of the drift facilitates progress, however, in blasting, as much deeper holes may be advantageously fired than in a narrow opening, but the work of removing and hoisting the rock is very heavy.—*Virginia Enterprise.*

THE reason why no more shipments have been made from the Wood River mines is this: Nearly all the mines are situated some distance from any public thoroughfare; that roads have to be built from these highways to the mines, which has been a matter of considerable expense; but now the roads are built, and nearly every ledge has on the dump from a few tons to as high as 25 to 50 tons, most of which will yield well. The mines are having their ore hauled and packed to Hailey, Bellevue and Ketchum preparatory for shipment to Salt Lake.

Contributions to the Ethnology and Geology of the Pacific Slope.

By Phillip Harvey, M. D., of Portland, Oregon.
[Original Publication.]

[CONTINUED FROM LAST WEEK.]

Theee views have at least the merit of probability, and are confirmatory of those of Leopold Von Buch, who is entitled to the praise of having heen one of those who prepared the way for Charles Darwin, ae Kepler did for Newton. In hie "Physical Description of the Canary Ielands," he eaye, "The individuals of continental epecies extend themselves and form, with their increasing dietance, varietiee which at length by their great divereity cannot longer intermix with other varieties and be led back to the main type, wherefore they hecome permanent species." From thie view we can see why a standstill in the struggle and consequent progrese of life can occur hut rarely and for a short time only in large areae.

According to

The Views of the Evolutionists,

Progrees largely depends upon the struggle for ife and survival of the fittest. It is ohvions, as already shown, how thie etruggle would be more intense on large areas. It should not be looked upon as an evil, but rather as a good, because it inuree to hardship and to etrife, and forces individnals and species that have degenerated to resign the field to better organisms. It is the same thing in nature as free competition in civil life, that givee tbe progressive man tbe advantage and pushes aside him who lingers in the rear. On emall secluded epaces, as, for inetance, on islands, the struggle for exietence is less active, being more limited in the divereity of its elements; in other words the violence of the struggle increases with the epace and the number of contestants; it has therefore been carried on the most strennously in the old world, and in consequence the largest, strougest and most intelligent heings have been produced there. These remarks do not apply to civilized man at the preeent day as forcihly as they do to lower beings, for commerce and intercommunication give to him all the world in common, and the new world and the old are as one. For him it is all one great battle-field, and to tbe victor belongs the epoils. But for the savage who comes in competition with bim, woe hetide him! Being the weaker, in spite of the teachings of philanthropy, he must succumb; that ie, unlees the civilization is a epurious one, that has enervated inetead of etrengthened its possessor, wben the more vigorous barbarian may and should obtain the victory, as wae the case in the etruggle between the Turks and Greeks that resulted in the capture of Constantinople. Gibhon showe clearly how the Greeks were there defeated, and bow and why they should have been.

The Maories of New Zealand recognize

The Inexorable March of Events

That muet result from their contact with Europeans, and have summed up the matter in the following pithy sentence: "Ae the white man's rat has driven away the native rat, as the European fly drives away our own, and ae their clover kills our fern, eo must the Maorie disappear before the wbite man himself." There ie much philosopby in thie, for not only the white man hae derived strength from the agee of intense conflict be hae paeeed through, but also tbe lower animals, and the plants have done the same.

A Fallacy about Indians.

Experience in tbe war of the Rebellion went to prove the fallacy of the common supposition that our Indian races have hetter constitutional powers of endurance than the whites, and that they are better able to stand up againet fatigue, privation and wounds. After Indian allies had heen brought into the field in the canee of the Confederacy, several regimente compoeed of Cherokeee, Creeke, Seminolee, Omahas, and otber tribee, were enlieted by the United States. Among theee, it was my fortune to serve in the campaigne of 1862 aod '63 in Arkaneas, Miesouri, Kaneas and Nebraska. I aleo had opportunitiee of seeing what kind of soldiers the negroes were capahle of making. Of all, tbere can be no doubt that the whites were in every reepect the moet efficient, more especially in intelligence, courage and endurance. It ie equally clear to my mind tbat the negroes made hetter soldiers than tbe Indiane, particularly in capability to withetand the effects of wounde. Of all, they recovered the beet and quickeet, and the Indiane the worst and sloweet. Among theee laet, too, conetitutional ailmente were the moet oommon, and their wounde were the most apt to be followed by diffuse inflammation, enpperation, gangrene and death. Resemblancee in tbe

Animal and Vegetable Products of Tertiary Periods.

And those of to-day, show, I think, that the climates of the earth were then not widely different from the preeent. The lignitee of the lower Columbia river region, reeulte of the arboreecent growthe of the eocene, give evidence of the exietence of timber there very similar to that now growing on the spot, and, coneequently, of analogoue conditione as to temperature and moisture. The fire, pines and cedare of Oregon and Waehington Territory are marvels of symmetry and magnificence. Shooting up to a hight of 250 ft., often 200 without a branch, from five to eight ft. in diameter, and straight as an arrow, they cannot fail to strike a beholder, unused to these forest giants, with wonder and delight. They grow in gloomy grandeur, marshalled side by side ae thick as they can etand together, shutting out the raye of the eun, and preserving a continual dampness and twilight in the hotteet and dryest weather. Where overthrown hy the warfare of the elements, their shattered trnnks exude resin copiously, as a stricken soldier on the battle-field pours out his blood. There, too, tbeir kindred giante of the eocene lie beaped togetber beneath them in liguite bede of an antiquity, compared to which the pyramids of Egypt are as things of yeeterday; and, as they lie imbedded, they show, thougb changed to coal, marks of the same woody fiber, and the same resinons exndation that the overthrown trees lying on the surface exhibit. Here and there in these coal-hede may he seen a tree that bae become infiltrated with silicious matter and transformed to stone, etill preserving a resemblance to the timber at present growing there, and ehowing its coniferous nature.

The Carboniferous and Tertiary Coal Depoits

Have an important connection with the introduction of the higher forms of life into the world. Iu the previoue ages, when all the carbon that served to form theee coals was mingled with the air and water in the form of carbonic acid, only low forme of life could he developed. Oxygen is a prime agent of vitality, and the more abundant it is, of course, the bigher and more active will be ite manifestations. The growtb of vegetation ie the result of the consolidation of the carbon of the atmospheric impurity and the liberation of the oxygen; and the rank vegetation that formed the carhoniferone beds made the advance in animal life that characterized the succeeding age—the mesozoic, or reptilian—a possibility. An eqnally profuse vegetation preceded the tertiary coal formations, and prepared the way for the mammalian age, and donbtless the procees still goes on and prepares the way for higher and higher forms of life. These are the two moet extensive coal formations, and they were promptly followed hy the greatest advances in animal life the world hae seen, ae far as we are instructed hy geology. From the wide diffusion of tbese two coal formations over the North American continent, we may infer that even in thoee early times it was the favored home of vegetation, as it is at present.

With Regard to the "Lost Tribes,"

That many of our good people delight to think and talk ahout, however completely they may have disappeared, and however long ago, so eager is the search that "undoubted" tracee of them are being from time to time "discovered;" and now they are sufficient to account for the population of half the globe. Among the latest of these "finde" is that of Rudolph Falb, a German professor, who, according to a San Francisco paper (the *Alta*), astonished the natives here, a short time eince, by the announcement that, by long study and observation, he had been able to identify the Aymaras, of Peru, with the ancient Jews. Of all American tribes, the Aymaras are the darkest and most beardless, and possees the long, coarse, straight and black hair of all the reet. A glance at the eculptures found by Mr. Layard at Nineveh and Bahylon, that furnieh us with the types of the pure and ancient Semitic race, would be sufficient, we shonld think, to convince anyone that this high and noble branch of tbe human family, cbaracterized hy wavy hair, magnificent and curly beards and a rather fair skin, cannot possihly be allied to the red man of America—moet certainly not to the degraded, black and heardleee Aymara; nor is it poseihle, with any ehow of reaeon, to enppose that one of theee races could have heen transmuted into the other in the brief limite of 3,000 yeare. Theee remarks are also, to some extent, applicable to other epeculations of a similar nature to the above, for which eee "The North Americans of Antiquity," by John T. Short, and other writings "too numerone to mention."

To-day all I thougbt of eaying to you on this prolific theme, I fear, would exteod my article to an undue length; though, as it ie, I have held myself in check. I will, therefore, conclude for the present by eaying, ae I intimated at the outset, a few worde about the "mound builders" as a distinct race. If you deeire it I may give you, at eome future time, a brief article on the civilization of Mexioo, Central America and Peru, and on the savage tribee of Sontb America, or, perhaps, I ehould rather eay, a eeriee of brief articles.

The Architectural Remains of the Aborigines

Of that portion of North America, now known ae the United Statee, are found moetly in ite eaeteru divieion. They conenst, for the moet part, of mounde and earthworke of varioue forms and extent. They are ecarce botb in New England and weet of the Mieeiseippi, but are rather numerous from the Great Lakee down to Florida, on hoth eidee of the Alleghaniee, chiefly, however, on the weet. I cannot, I think, do better tbao quote the hrief remarke of Peschel on thie head, which I incline to do, the rather ae his work ie but little known here. To be enre, a tranelation of it, from a London edition, wae pnblished hy the Appletone some yeare ago, but Mr. E. L. Yonmane writee me it hae heen but eparcely distributed. Thie I am eurprised at, for, though I consider the translation to he a poor one, the work itself is so excellent that it should he read and referred to hy everyone desirous of information on ethnology. The quotatione here introduced are from the original. "The majority of American archæologists ascribe these works—the Indian mounds—to a supposed extinct race, to which they give the name of "mound builders." Theee they imagine to have wandered from Mexico toward the northeast or from the northeast toward Mexico; but if these remaine were nothing but a ray of the Nahuatt civilization, they should occur more frequently the nearer we approach the highlands of the Ariahuac; but juet in Texae all tracee of them disappear, and there, as in Chihuahua, were seated, according to Cabeza de Vaca, very rude and half-starved tribes, who fed on fishes, roots and the fruit of tbe prickly-pear. The acconnts of the Spaniards

Of the Entrenched Villages of the Indians

In the former slave States, and the picture that Jacques Cartier bae left ue of tbe Iroquois city of Hochelaza, now Montreal, correspond sufficiently to the ideas we can form of those earthworke from the numerous ground plane and transverec cuts in Schoolcraft's voluminous work on the Indian antiqnities of the United Statee. We agree entirely in opinion with S. F. Haven, wbo eupposee tbese architectural remains to be the work of tbe ancestors of the present Indians. He has shown that a mound was erected over the body of an Omaha chief in the year 1801, and that there was found by Lewie & Clarke, on the upper Miseouri, a whole row of recent entrenchments. Charlevoix informs ue that the Iroquois, hefore bis time, erected more enteneive works than they have done since; so that they, as well ae many other undeveloped races, may have neglected their old arte after their contact with a more advanced oivilization. The huilders of tbese rude earthworke were, we conolude, the ancestors of those hunter tribes who were ousted by tbe European settlere and their descendants. They lived tben on tbe chase, and may have lived in the same way for untold centuries before the advent of the whites."

Mounds of Earth and Stonee

Are the most primitive of structures. They are tbe dawning evidences of the constructive genius, and bave heen made, in the first part of tbeir advance from the lowest barharism, by every people. Every Caucasian tribe or nation, whether Hamitic, Semitic or Aryan, has in one part of its career thrown np mounds, and semi-savages of every race bave manifested this propensity. Indeed, so obvious is the device that it can scarcely be called an invention. It is an instinct incident to the very hirst step of hnman progress, and the pyramids of Egypt, as well as the great maneoleum of the monaroh of Caria, at Halicarnassus, from whom (Mansolus) etructures of thie kind have received their name, however vast or elaborate they may have been made, are but advanced indications of the native impulse. It is mere folly to make the manifeetation of a mere dawn of this propensity, as seen in our Indian mounds, the distinguishing characteristic of a race.

As tbe century approaches its termination, ecience becomes characterized by a mode of reasoning based on obeervation, and not on dreams. Her mantle should be kopt whole, olean and simple; and ethnology, as well as the other eciences, should no longer be degraded by the tawdry rage of fiction.

El Dorado County Miners' Union.

In the last issue of the *Mountain Democrat* is published the following card, eigned hy D. J. Knighton, President of the El Dorado County Minere' Union: We deeire to make a etatement to the miners of thie county, and to its citizene generally, in regard to the Minere' Union juet etarted in thie county, its purpose and intention.

The El Dorado County Minere' Union, No. 1, ie established ae a benevolent and fraternal order for minere.

Whereae, in view of the fearfully hazardous nature of our vocation, the prematnre old age and many ille, the reeult of our unnatural toil, it ie good policy to found a eociety which would enable the miner to be hie own benefactor, and whereae it ie profitable to retain ekilled and experienced labor wben ite demand ie eignificant in proportion to the heneiit to be derived from it, and whereas we ehould cnltivate an acquaintance witb our fellowe, in order tbat we may be the better enahled to forman nndivided opposeition to acte of injnetice. Therefore, we, the minere of El Dorado connty have resolved to form an aesociation for the promotion and protection of our common intereets and bave adopted a constitution and by-lawe for our guidance; for united, we poeeeee etrength. Let ue then act juetly and fear not. The foregoing preamble and reeolution explaine our aim and purpose in all bnt one particnlar, and that ie, that the union ie pledged to resist the working of Chinese in the minee of thie county.

For the foregoing purpoeee thie union ie eetablished, and we confidently appeal to all minere to join witb us in making the nnion a power and hlessing in the community, a enpport to miuere in tbe bour of need, and a ebield and refnge to the widow and fatherless. To enable all to join at emall expenee, tbe charter will not be cloeed for two weeke; the fee for that time ie $1.90, after which it will be raieed to $2.50. All minere in thie county who wieh to join, can meet with ue in Placerville at Confidence hall, on Sundaye, at 2:30 P. M.

Drainage of Mineral Fields.

J. Van Cleve Phillips writee to the Chicago *Mining Review* as follows: The law disoovered and publiehed by the writer some time eince in the *Mining Review*, that all ores in mineral fielde have been deposited with direct reference to their drainage, or that the greatest amount of ore is where there is the least possible amount of water, all thinge in the geology of the vein being coneidered. Thie law ie directly opposed to tbe eenses, which tell tbe miner that where there is the moet water, there is tbe most ore; and to be able to grasp the philoeophy of thie law and apply it, makes it necessary that the vein sbonld be seen in tbe ideal, with all ite inclosing rock, altitude, topogiaphy and geological position in the mineral belt, or basiu where tbe ore occurs. This law of drainage applies to the coal veins under the hroad wet prairies of the center of the continent, which, hy impervioue strata and a system of faults, are formed in water-tight compartments; to the Iron mountains and knobs of Missonri, Wyoming, Lake Superior and Mexico; to tbe magnetic iron veins in the iron helt of Appalachian chain, wbich are contact veins in bornhlende slates, with a dip of 70° to all the oree in the iron hasins on tbe mountain slopes, or "great valley;" to all lead, zino, copper, silver and gold veins, whether the metale are in the hornblende slates of Virginia and North Carolina, or quartz veins in the clay slates of California, Arkansae, Old or New Mexico, the principle ie tbe same, and this law is to be tbe subetrncture on whioh the mining column of the future is to he reared. It most be remembered that for many thoueand yeare tbe senses said that the sun went aronnd the earth, and tbat science demonstrated the oppoeite. It has alwaye been believed that the center of the earth is filled with melted matter; science will demonstrate that the earth is a geode formed by orystallization, and has grown according to a life principle. It has heen believed that the earth cracked, and ores came up from a zone of gaseous metalloids that floated under the earth's crust; science will demonstrate that all ore veins are eystematically arranged in the strata in families, genera and epecies, and are the result of crystalline laws, that worked harmoniously with all tbe other forces and phenomena of the mineral field, as springs, lakes, ponds, creeke, rivers, ridges, mountains, valleys and ravines. That the elevating and abrading forces that formed the smallest golch or mountain canyon, formed tbe ravines of the Ozarks and miniature valley of tbe wide coal hasine. These are all for the drainage of the mineral centers. It may be the miniature epring branchee that drain the center of the 20 great basins that have a quaqna-vereal dip of the lead fields of the upper Mississippi, the great mineral centere and belte of the Ozarks, of the Appalachian cbain, or spring branches of the Arkansae, Platte, Columbia or Rio Colorado. These rivers, with their million hranches, are the drainage eyetem of tbe ore centers, and each spring hranch hae direct reference to, and carries the rain water away from its family of mineral veins.

Let us see how much money could have been saved, had this law been fully understood 20 years ago, and heen applied. The Sutro tunnel would have never heen run, and $6,000,000 been saved. For want of this knowledge, the impervione selvagee that inclosed the Comstock vein were cut and water let in, loeing, by needleee way of pumping of water from the mine, $10 000 000; mining by pumpe in upper lead field, $3,000,000; in Missouri lead fields, 3,000,000, which came under my own observation. Here is $22,000,000 lost, and think of tbe hundrede of mining campe in the mountains, and work done by novicee, where unneceeeary water has heen pumped. Thie law ie illuetrated io my eurvey by 100 mape, eectione aod diagrams, and applied to the mineral fielde of center of thie basin, coal, iron, lead, zinc, copper, and qnartz districts of the Iron Mountain regione of Missouri, upper lead fielde, eilver fields of Arkaneas and Mexico. My eurvey I made at my own coet, and the mining indnetry muet wait until each time as I have the neceeeary means to put thie law forward in a practical form, so that it can he applied hy the explorer, and need in developing minee.

THE NEW QUARTZ CRUSHER.—The company organized for the manofacture of the Dyer Cannon Ball quartz crushere ie making good progreee toward heing able to furnieh tbe demand for them, as the patterns of the different eizee are ahout ready. One of the larger eizee, a No. 3, capahle of cruehing 10 tone of quartz in 24 honre, has been pnt up on the Jim Crow quartz mine, Sierra coonty, and etarted regularly to work on Monday of thie week. Information hae been received that it worke admirahly, and givoe entire eatiefaction. Another machine, a No. 2, capable of cruehing five tone in 24 honre, hae been ordered to be eent to Gold Hill, Nevada. The No. 1 machine, which ie intended more for prospecting operatione, will crueh from one and a half to two tons in 24 houre, but none of these have yet heen bnilt, hnt will he eoon. All tbe machinee are to he constructed on the same plan, tbe only difference heing as to their crnshing capacity. One of the No. 2 machinee ie now eet up at Brnnsteter'e planing worke, where it may be eeen in operation daily. It attracts a great deal of attention from those intereeted in mining mattere, and ie regarded with great favor by all who have seen it work.—*Grass Valley Union.*

Mechanical Progress.

New Friction Gear for Wire Ropes.

The rapid wear and tear of steel-wire ropes for winding at mines, has always been a constant source of complaint, being due, in a great measure, to the sudden checking of the movement by the use of friction clips, especially when there is a heavy strain upon the ropes. Since the latter are by no means cheap, it is important to treat them in such a manner as to keep them in working order as long as possible, and the preservation of wire ropes has, consequently, long been a momentous matter for the consideration of mine owners and mechanical engineers.

An invention has, however, recently been patented, which promises to be of considerable value to all interested. It relates to improvement in brakes for steel, wire and other ropes, and is of more than ordinary interest to those using them. The invention is designed to check the rope without any of the severe punishment caused by hard compression or attrition, and without sensible wearing friction on the rope. For this purpose a brake is fixed, not on the rope itself, but on mechanism connected with V pulleys, round which the rope is twined, forming a figure 8. The friction on the pulley is so great, by reason of the turn round each pully given to the rope, that no appreciable relative motion can take place between the two. As the brake, however, is applied on the axles of the pulleys, or rather on brake-wheels on these, or on one of the axles, whatever friction is expended on stopping the rope, is spent on the brake-block or the belt and brake-wheel, and not on the rope.

The apparatus is simple and effectual. Upon the overhanging ends of two shafts, having bearings in a stout frame, four pulleys are placed, two on each shaft, connected by spur-gearing. On the other ends of the shafts are placed two brake-wheels with a single brake-strap, so arranged that a man, by means of a lever, can put a sufficiently powerful strain on the brake-strap, so as to give the brake the requisite power. Upon one of the shafts is a worm-wheel, or first wheel of other train of gearing, and a clutch, so arranged that the gearing can be connected with the shaft at a moment's notice.

The rope is passed from a reel through a guiding eye on to one of the other pulleys, around which it passes. It is then wound around the other outer pulley in the opposite direction, then around the opposite inner pulley, the direction being the same as in the first instance, and finally around the remaining pulley in the same direction as round the second pulley. The brake can be applied gradually or suddenly without any more friction or severe compression on the rope. By putting the clutch into gear, the apparatus becomes a winch, and, the brake being thrown out of action, the rope hauled in. In lowering heavy weights the brake can be applied, the clutch thrown out of gear, and the descent regulated with the greatest nicety by hand-pressure on the brake-lever. The apparatus is no more severe on the rope when the brake is applied than at other times, excepting, of course, the increased tensile strain necessarily entailed when the lowering of a heavy weight is checked, and while in other winding apparatus, there is the riding of one turn over the other, to the great injury of the rope.

A New Direct Process.—Mr. J. C. Bromfield, of Brighton, has patented a new process for making iron and steel direct from the ore, and which, we are assured, has been spoken favorably of by no less an authority than Sir Henry Bessemer. Besides the main features of the direct transition from the ore to a high class of metal, either iron or steel, the sub-products, notably the furnace gases, are by this process saved and utilized. Mr. Bromfield grinds to powder coal or coal dust and iron ore, or "blue hilly," in proportions varying in the nature of the materials; and, when much silica is present in the ore, he adds alumina with or without calcium oxide or carbonate of lime. At the same time he extracts a mucilage by hydraulic pressure from seaweed steamed in a close jacketed boiler. The powder and mucilage are intimately mixed with Portland cement, carbonate of lime, magnesia lime, or calcium oxide, in proportions varying with the nature of the ore, and this mixture is formed into bricks by a powerful press. When dry, the bricks are coked in a retort, whereby their sulphur and phosphorus are driven off. The gases are led through a hydraulic main and utilized, either for maintaining the combustion or for illuminating purposes, in which case the by-products are also turned to account. After coking, the bricks are ready for the smelting furnace, and, as it is claimed, produce a high class of metal, from which practically the whole of the phosphorus and other injurious elements of the raw material have been expelled.—*Iron.*

A self-blowing forge is among the recent mechanical inventions. The hearth and the hood of the forge are of the usual pattern, but underneath the hood is suspended a small steamer. At the top is a safety valve and steam gauge, while at the back of the hearth is a water gauge. A return pipe is brought from the boiler to the tuyere, the water in which becomes pretty well heated before again entering the boiler. At the back of the forge is a small vertical engine, with a two-inch cylinder and four and one-half inch stroke, which, by means of a grooved fly-wheel and endless band, rotates the fan. When lighting the fire, the bellows is worked for half an hour by hand, by means of a handle, and during this time sufficient steam will have generated to drive the engine, which will then work automatically as long as required. The blast is regulated by means of a tap between the engine and boiler. The same engine can also be employed to turn a small lathe, and will readily do about one-horse power—an ingenious application of the utilization of waste heat.

A New and Cheap Method for Enameling Water Pipes.

Two inventors in Bohemia have patented a direct process for enameling cast-iron pipes, which can be applied to other hollow castings that are made with cores. It consists in simply covering the sand core with the enamel, and then pouring in the iron as usual. The heat of the melted iron fuses the enamel, and it attaches itself firmly to the iron, and detaches itself so completely from the sand, that the enamel is said to be all that can be desired for water pipes and other industrial purposes. In casting sinks, basins, urinals, etc., the enamel can be applied to the sand on that side of the mold which is to form the inside of the basin.

The composition of the new enamel is kept a secret, but is said to differ from the old form in the simplicity of its preparation and the extraordinary cheapness of the materials used, It is so cheap that it has found extensive use in many branches of industry.

In color this new enamel is gray. It will be useful for gas pipes as well as water pipes, because it will make the pipes absolutely tight by this glassy lining. It will be no less useful for coil pipes, which are always liable to corrosion from the gas they contain, but for conveying acid liquors, like mine water, and in chemical works, for sinks and waste pipes in chemical laboratories it should displace lead, glass, or terra-cotta.

Employment of Iron in the Arts.

Iron is employed in the arts in three conditions: 1. In that of cast iron; 2. in that of wrought iron; 3. in that of steel. The 1st and 3d of these substances consists of iron combined with carbon: in cast iron with more carbon than in steel. Wrought iron is the metal nominally without combined carbon, but it is rarely obtained in practice so pure as to be absolutely devoid of a small proportion of carbon. When the molten stream of iron comes from the furnace, it is not in a state fit for the forger or the maker of steel. For this purpose it requires to be refined—that is, to have its carbon burnt away in a furnace called a finery, and, still further, in the process technically called puddling. Intense heat and atmospheric air form the means by which the superfluous carbon is discharged, and the iron left in a comparatively pure state. The further process of the metal is simple enough. It is submitted, while yet incandescent, to the operation of enormous hammers, which knead it into a tenacious mass. This is then taken to rolling machines, which reduce it to the requisite size and shape, whether of bars or sheets. For the production of steel, a still further series of processes become necessary. Cast steel is produced by melting the bars of blistered steel in crucibles of fire-clay and then pouring the fluid metal into ingot molds.

Improvements in Slide Valves.—One of the most needed improvements in slide valves has lately been effected and introduced, consisting in a method for reducing or preventing more efficiently than at present the noise made by exhaust steam of engines, which has heretofore been attempted to be accomplished by the employment of muffles and other similar devices. It is well understood that, with the ordinary link motion and slide valves used on locomotives, the exhaust edge of the valve must be moved the length of lap and lead before the piston receives steam from the direction in which it has been moving; in other words the exhaust opening begins before the piston finishes its stroke, and before the steam has fully expanded. The exhaust being also opened suddenly by the quick movement of the eccentric, a wasteful and disagreeable explosion of steam from the cylinder takes place. To remove this difficulty, the exhaust steam, instead of being allowed to explode in the manner described, is gradually released, and without back pressure.

The Smoke Nuisance.—A convention of experts has been discussing, at Leeds, England, the problem of how to abate the smoke nuisance in manufacturing towns. Many plans were presented, and the meeting finally passed two resolutions—one declaring that there are inventions by which smoke may be effectually consumed or actually prevented, and the other that, in the opinion of the meeting, the smoke arising from steam-engine fires and furnaces could be consumed, and often without injury to the boiler and with a saving of fuel.

Scientific Progress.

Spontaneous Combustion.

The growing frequency of fires, which can be referred to nothing but spontaneous combustion, has set the insurance companies, and many other parties, quite on the *qui vive* to search out, as far as possible, the many conditions under which such occurrences may take place. Among others, we note below two conditions, which, until recently, were scarcely thought of.

Spontaneous Combustion of Lampblack.

Lampblack, if packed in a leaky cask, when freshly papered, condenses the atmospheric gas on its surface, which, owing to the porous nature of the substance, is very large in proportion to its weight. In condensation, the gases give out a certain amount of heat, which, under favorable circumstances, is sufficient to cause the ignition of any very inflammable substance accidentally present, and this, by combining with the condensed oxygen, liberates heat enough to cause the ignition of the vegetable black, which, when once started, soon spreads, until the contents of the cask become red-hot. The spontaneous ignition is not infrequent in many large carriage factories, and builders' shops have been destroyed solely from this cause. So well is it known now, that various devices are adopted to obviate the chances of disaster. A large London firm packs the lamplack in half-pound packages, done up in brown paper, and then packed in casks. The use of printed paper would insure ignition from the absorption of the oil in the printing ink by the lamplack, generating gas which would speedily produce ignition.

One among many instances of well-attested cases of spontaneous ignition occurred at a large carriage works at Grantham, England, in a shop far away from fire, or the chances of a spark. The paint-shop, says the *English Mechanic*, was gradually illuminated on a mild summer's evening during daylight. It was noticed through the workshop windows, and seen to be a tub of loose lamplack consuming the cask. It was easily carried out onto the grass to finish its work. It was thought that, being near the grinding-paint stone, some oil had been splashed into it, or an oily rag had been dropped into the lamplack. The secret was soon found out by the pallet knife being among the ashes of the cask, having been carelessly dropped in with some wet paint on it, or even without wet paint—the dry, oily paints which accumulated on the blade, near the handle, would be sufficient to cause ignition. It is not the large quantity of oil, but the small quantity, which is the cause of it. This is so well known that some coach-makers, when they receive lamp-black, put it into a sound cask, and pour enough linseed oil into it to saturate the whole.—*Exchange.*

Spontaneous Combustion in the Process of Drying.

A recent fire on the premises of William S. Slater, in Rhode Island, which did some injury to his mills, brings into conspicuous notice the spontaneous combustion of yarn dyed certain colors while not fully recovered from the operation of the dry-room. The statement is made by Edward Atkinson, that during the past four years the several mutual companies of New England have suffered a loss of more than $300,000 from spontaneous combustion of dyed cotton goods in dry-houses or finishing departments. Some heavy losses have occurred from this cause where aniline, cutch, logwood, iron and other common substances have been used for dyeing, without the use of oil of any kind.

There are several colors produced in calico print works and dye-houses which are sources of danger from combustion. They are the colors developed after the materials have been applied to cloth or yarn by chemical reactions in the tissues, with the production of heat, and also by the aid of heat applied to the fabrics in the aging boxes and chambers. Spontaneous combustion in black, brown, slate, and pearl-dyed woven fabrics and yarn is frequent. The conditions under which fires have occurred seem to have been where cloth or yarn recently dyed or dried over dyeing cans has been rolled or piled hot or slightly damp, either of which conditions is hazardous as regards spontaneous combustion.

Some time since, Edward Atkinson suggested the following precautions to be observed by members of the company of which he is president: Provision should be made for a thorough cooling and drying of the fabrics before folding, rolling, or piling in bunches; dyed fabrics must not be allowed to remain in compact masses in an unfinished state over night, but have them starched, cooled, and finished as quickly as possible; dyed goods or yarn should not be piled in large quantities, but spread over a sufficient surface to permit them to cool readily; a suitable place of deposit, as nearly fire-proof as it can be made, should be provided for keeping goods over night that are liable to spontaneous combustion, if such keeping cannot be avoided.—*Manufacturer and Builder.*

How the Trees Drink.—A large tree on a dry summer's day throws into the air many barrels of water. This is forcibly pulled from its attachment to the particles of soil and lifted to the extremities, 50 to 100 ft. above, using in this fully as much force as would be required to raise the same by mechanical means.

Formation of Coal from Marine Algæ.

The theory that the various beds of coal had their origin in immense deposits of marine algæ, contrary to the generally prevailing opinion that they originated from accumulations of terrestrial plants, appears to be now meeting with acceptance by many geologists. The theory was advanced by the late Prof. F. Mohr in an interesting work entitled the "Geschichte der Erde," and in which he supports his views by many ingenious arguments, some of which have since been confirmed. The luxuriance of submarine vegetation in many portions of the ocean is astonishing, the Southern Hemisphere appearing to be the region in which these algæ occur most abundantly. In the neighborhood of Terra del Fuego, for example, a fucus-covered bank was passed which had a depth of more than 24 fathoms. Since the leaves of the *fucus giganteus* were buoyed up everywhere on the surface, this plant must have had some longer than 144 ft., as they never grow up vertically, but always inclined at an angle. Darwin compares the primeval woods of the South American continent with those of the bottom of the Antarctic sea, and declares the latter to be by far the grandest. Mohr mentions several facts tending to confirm his view of the origin of coal. One of the most noteworthy is the very small percentage of mineral matter in the majority of coals, which is very much less than that found in peat, lignite, etc., which are of terrestrial origin. Again, the considerable percentage of nitrogen found in coal is a confirmatory fact. The distillation of coal invariably develops considerable quantities of ammonia, which is rarely developed from peat or lignite. This large proportion of nitrogen is referred by Mohr to the innumerable animals that lived on the seaweed, from which he believes the coal was formed. One other important fact that speaks in favor of the origin of coal from marine algæ is the presence of bromine and iodine in coal soot, which was proved by Mohr and confirmed by Prof. Landolt. This fact is very significant, since the presence of these elements would seem to be a certain indication of a marine origin of the substances containing them. The great source of bromine and iodine is from the seaweed (kelp) gathered from the seashores. Taking these facts all together, they lend the strongest probability to the theory that the great coal beds originated from immense depositions of marine plants, and not, as has hitherto been very generally believed, from terrestrial vegetation.

Solar Physics.—In concluding a series of lectures on "Solar Physics," Prof. J. Norman Lockyer recently said: "I am in honor bound to say, as the result of the work on our solar physics, in that small branch of the inquiry into solar matters with which I am more personally connected, that my belief is that the late work has changed the views which were held, say 20 years ago, to this extent: Whereas, 20 years ago we imagined ourselves to be in full presence in the sun of chemical forms with which we are familiar here, I think, in this present year, we are bound to consider that that view may be modified to a certain extent, and that we are justified in holding the view that not these chemical forms with which we are acquainted here, but their germs really are revealed to us in the hottest regions of the sun."

Wood Decay.—The peculiar decay of wood is due to the inroads of a certain fungus on the fiber of the timber, says an American farming paper. When wood is seasoned, it is dried, so that fermentation of its sap cannot take place; in fact, the sap has evaporated. But when the wood, even after seasoning has been accomplished, is exposed to warmth and moisture at the same time, ordinary decay sets in, and paves the way for the growth of the little fungus, producing dry rot. Sometimes disease begins within the interior of the wood, the little spores or seeds of the fungus soaking into the roots of the trees while dissolved in rain water. The effect of the disease is that the wood fibers soften and dry, so that, finally, they may be rubbed to powder between the fingers.

Archæological.—At the late Archæological Congress, held at Tiflis, Prof. Samokvasoff gave an account of his discoveries in the graves near Pyatigorsk. He excavated about 200 places of interment belonging to the stone, bronze and iron periods. In the larger graves, bronze implements were found with the stone ones. As there were in these graves, besides the bones of sheep, several split human bones not belonging to skeletons, he inferred that during the bronze period the people in that part of the Caucasus were man-eaters.

Natural Sulphuric Acid.—It is said that a remarkable discovery has been made in Sweetwater county, Wyoming. It is a deposit of sulphuric acid in a natural state. The odor, chemical action and general appearance of the stuff demonstrates it to be a pure quality of sulphuric acid. The ground is impregnated over a large area—100 acres or more—and parties have filed claims upon it.

Ancient Stucco Luster.—The peculiar brilliancy of the mural painting of Pompeii is said to be due to a stucco luster of chalk and marble dust, and an Austrian architect, Hansen, who discovered this, has produced the same sort of work.

Mining Share Market.

Business at the Stock Boards this week has been fair, as our record of sales shows. At the north end of the Comstock nothing is being done that can at present much affect the market, though at no distant day it will assume much importance, and will prodnce an effect among dealers. The only thing liable to immediately affeot the price of stocks at any point at that end of the lode is the crosscut that is being run east on the 2500 level of the Union Consolidated to explore the southwest deposit, some 200 feet distant from the point where the stopes on that level were opened. Some ore was taken from that deposit, and mixed with that from the 2500 and 2600 stopes, hut nothing was done toward following it up, or making explorations to ascertain what might lie behind it.

At present the principal work in this section of the lode is being done on the 2900 level. It is of a character that will drain, ventilate and thoroughly open up all the ground above, and, at that depth, in both Mexican and Union Consolidated.

All is going ahead well in the old bonanza mines, hut they are not yet ready to make any regular and exteosive explorations. When a start is made in that part of the lode it will involve all the ground from the Ophir to the south line of the Gould and Curry.

At the middle mines the interest at present centers upon the drift that is going west on the 2600 level from the Chollar-Norcross-Savage shaft.

News in Brief.

GLADSTONE declines to interfere with the operations of the Mormons in England.

THE exhibition building at Sydney, N. S. W., has been totally destroyed hy fire.

IT has cost Chili $50,000,000 to the present time to prosecute the war with Peru.

THE recent earthquake caused $250,000 damage in Panama, and $100,000 in Aspinwall.

THE Khedive, with the approval of Eogland, has offered Baker Pasha the reorganization of the Egyptian army. He accepts the task.

IN three years past over 1,200 buggies and carriages have been sold in Los Angeles city.

WORK is progressing well on the Nevada and Oregon railroad. Trucks and other material for the road arrive almost daily.

BY the fall of a gallery in the exposition building at Pittshnrg, seven persons were injured, two fatally.

GENERAL WOLSELEY and Admiral Seymour are to he raised to the peerage for their distinguished services in Egypt.

A GRAND reception was given at Washington, Saturday evening, to Engineer Melville and party, of the *Jeannette* survivors.

AN account of a duel with six cowhoys on a side is received from Denver, Col., four men being killed at the first fire.

AN urgent appeal to public charity has been made for the scattered settlers and fishermen on the Labrador coast, threatened with starvation.

THE differences between the locomotive engineers on the Gould railroads and officials of that system bave been amicably settled, and a strike prevented.

The Judson Works.

The foundation for the blacksmith shop at the Judson Works is finished. The foundry will probably he completed hy the latter part of next week, as all the heavy timhers have been put in place, and the surface boards are now heing put on. The large tank on top of the offioe huilding is finished. A mansard roof has been huilt over it, and a 30-ft. flag-staff has been placed on top of the building. The halance of the machinery will arrive from San Quentin on the 1st of October. The shop where the Victor mowers are manufactured is finished, and is in running order. The machinery is heing pnt in position at the tack factory. This machinery inclndes several new improved machines from the East. Tbe rolling mills are heing pushed rapidly, and they expect to turn out iron hy the 1st of January. A first-class improved lathe, 30-inch swing, for the machine shop, is in position, and in fine running order. Tracks for cars have heen laid all over the grounds, and through all the huildings. The new horizontal 50 horse power engine is working daily, and is in splendid order. It is set upon a bed of granite, and is enclosed in a substantial house. The hoiler-room is completed, and a Root's patent sectional boiler occupies it. This building is of brick, with a corrugated iron roof, and is connected with a chimney fully 50 ft. in hight. The offices are a model of neatness and convenience, and are finished off in hlack walnut. A new wood-turning lathe has heen placed in position in the wood-working department; also a large-sized latest improved hand saw. The pattern workers are working on patterns for the foundry. The painting and varnishing-rooms are ready to receive work, and a number of wagons are now heing finished, and will he pnt on the market shortly. The shop is finished up in first-class style, and is a credit to the institntion.—*Oakland Tribune.*

THE Burro camp, N. M., is doing hetter than ever hefore. The output is steadily increasing, while the strikes recently made in the St. Louis, Pittshurg and Boston Queen eqnal in richness any development hitherto made.

THERE is one rule that never fails, and that is this: When promoters of a mining enterprise are more anxious to market their shares than they are to develop their claim, it is safe to give them a wide berth.

THE forests of the Adirondacks are doomed to destruction, a company having heen formed for the purpose of constructing a line of saw-mills through them, and converting the growing timher into merchantahle lumher.

A CLAIM sufficiently developed to give an intelligent idea of its merits is generally held for all it is worth, and if offered at a low price may be a dear investment after all.

THE new smelting works of the Little Wood River mining and smelting company, at Muldoon, have heen started. The costs of the works has heen about $75,000.

UNDER a new law, three women are to be appointed in each county of Ohio, in coojunction with two men as a hoard of visitors for the charity and correctional institutions.

MINING SUMMARY.

The following is mostly condensed from journals published in the interior, in proximity to tbe mines mentioned.

CALIFORNIA.

ALPINE.

STARTING UP.—*Monitor-Argus*, Sept. 22: Arrangements for the starting up of the Colorado mine is progressing favorably, and we expect soon to see work reasumed on this valuahle mine.

ISSABELLE CO.—Large quantities of lumber, timber, cable-wire rope and other machinery for the holsting works at the Stella mine, are being hauled through here en route to the mine. The capacity for working the Stella ore will soon be greatly improved, and as soon as the necessary improvements are made, the company will be making large shipments of bullion from this valuable property.

RICH STRIKE IN ORION MINE.—A very rich deposit of carbonate ore was struck in tbe Orion mine during the fore part of this week, and the prospects for a large depcait, as supposed by several experienced mining experts, who have examined it and report it the most flattering terms of this new and most important development, ever made in the mines of Alpine county. From a large number of assaya made, the ore averages $300 per ton in silver and 52% lead; some very fine specimens of crystallized carbonate assay as high as $500 per ton in silver and 60% lead. This ore is supposed to come from the same ledge as that passing through the Colorado No. 2 mine, the croppioga on the surface showing a ledgo over 100 ft in width. The rich strike in the Orion causes quite an excitement in Alpine.

LIMESTONE.—A sample of limeatone from A. M Grover's lime quarry, at the Hot Springs, 3 miles west of Markleeville, was handed to us last week, which we slacked, and do not hesitate in pronouncing it a number one article of lime. It was easily slacked, and is of a beautiful white color, not surpassed by any lime we have ever seen. Mr. Grover claims that there is a vast deposit of limestone formed from the springs, and he bas engaged and commenced hauling It to the Exchequer mill, where it la used in milling the Stella ore.

AMADOR.

ACME.—Amador *Sentinel*, Sept. 22: This quartz claim, located a few miles above Volcano, is being prosecuted vigorously. A contract has recently been let to sink the shaft 100 ft deeper, which will carry it dowo to 350 ft. Mr. McLaughlin has the contract to do tbe work. Also another contract has been let to Messrs. H. Allen and George Sterling to run a tunnel 100 ft in length, at a depth of 150 ft. The last clean-up from this mine, consisting of 280 tons, yielded at the rate of $15 per ton. The ore body has somewhat pinched, and hence sinking and drifting are in order.

DOWNS.—Sinking has beeo discontinued for the present. A ledge 7 ft wide has been struck in the new shaft. The mill cannot be started, owing to the lack of water. S. L Breese baa gone up to erect a building over tbe new hoisting works.

ITEMS.—The Amador canal has given considerable trouble of late, owing to the frequent occurrence of breaks. .....The Zeile mill has lost 5 days this month from this cause.....The clean-up at the Keystooe last month, we understand, was the best for a long time. Ths yield waa in the neighborhood of $40,000.

BUTTE.

BIG BEND OPERATIONS.—Gridley *Herald*, Sept. 21: It is evident that the company of capitalists interested in the scheme of turning the waters of Feather river, at Big Bend, and extracting the gold from the channel, mean business. The machinery to he used in boring the tunnel is nearly all on the ground, and it is likely the work will begin within a month. Major McLaughlin, the projector of the enterprise and a gentleman of indomitable will and rare executive ahility, has recently returned from the East, and is now personally superintending the carrying out of his plans.

CALAVERAS.

SOME GOLD.—Calaveras *Chronicle*, Sept. 21: Mr. C. Schlund, banker and buyer of gold dust in this place, showed us a gold bar of the value of $4,000. Mr. Schlund informed us that the bar was the amount of gold dust purchased hy him during the last 2 weeks. Not bad that —$4,000 for 2 weeks, or $2,000 a week. It is evident that the mining ground in this vicinity is not entirely exhausted of its auriferous wealth yet.

EL DORADO.

RICH ORE.—*Democrat*, Sept. 23: Ballard, Redd, Weatherwax and Alden continue to take out some exceedingly rich ore from their Alhambra claim, Kelsey district. It is dark in color, heavily sulphureted and extremely rich in free gold. From a chunk not larger than Daniel Webster's head, they recently crusbed over $500.....In the Kum Fa, at a depth of 624 ft, on the 30 degree incline, they have struck what appears to be bedrock, and have obtained a rich prospect.

ANOTHER DIAMOND FOUND.—Wm. Montgomery, of this city, having read our notice, in last week's issue, of former diamond finds in this vicinity, was thereby prompted to search in his black sand, the manipulation of which is his specialty, and succeeded in finding a diamond that if, on cutting and polishing, it is found to he without flaw or fleck, is estimated to be worth in the neighborhood of $80. The diamond which, in our last issue, we credited to Gideon Jeffreys, was found by James Jeffreys, in 1875, about 100 ft from the mouth of his tunnel, on Chile ravine.

INYO.

A FINE SPECIMEN.—Inyo *Independent*, Sept. 23: There has beeo on exhibition at the Independence assay office, during the past week, one of the finest gold specimens ever seen in this town. The piece is from the Palma gold mine at Cerro Gordo, now being developed under the general superintendence of Mr. M. A. Wheeler. The specimen is about 8 inches long, 4 inches wide and 3 inches thick. The surface is literally studded with fine points and grains of bright gold of a high grade of fineness. Mr. S. D. Woodbull, who brought up the specimen, informs us that similar pieces are taken out almost daily. Mr. Wheeler is pushing the work with great energy.

THE NEW FURNACE.—A. M. Stetson, one of the new Montezuma owners, was in town last Tuesday evening. He has been engaged in tearing down and loading up the furnace and machinery at Darwin for tbe new works. It is expected to have the material on the ground by next Monday, when the work of putting it up will be pushed as rapidly as possible.

LOS ANGELES.

CASTECA MINES.—The exteosive ditch to the Castoca mines will be finished in about 6 weeks. It will carry 1,500 inches, miners' measurement, of water, and have a fall of from 200 to 300 ft. There is no lack of water at the source of the ditch to supply this amount, and that being the case, we may look with certainty for gratifying reports from the Casteca country hereafter. Nothlog but a sufficiency of water was needed to make that region one of the best paying auriferous belts opened in this State. Gold in remunerative quantities is distributed through that entire region. So rich is it in places that for many years individual miners have made good wages whenever they could get a pool of water in which to wash the dirt by the pan process. With a large volume of water, and the force it will have when taken from the ditch, ground sluicing will give returns that will bo simply wonderful. The gold ranges at 22 fine, and brings at the mint $19 per

ounce. Its character is grain and coarse, although there is also a great deal of scale gold found in places. But the great advantage of this auriferous belt is in its immensity and in the general diffusion of gold throughout its entire area, reaching from a point a few miles above Newhall to Elizabeth lake, and taking in a breadth of country ranging from 10 to 25 miles in width. The outlay for bringing water to this district is as nothing to the returns this company will realize from their investment.

MONO.

THE ORO DEVELOPMENT.—*Bodie Free Press*, Sept. 21: The development in the Oro mine was visited on Wednesday by Superintendents H. A. Whiting, of the Bodie Con. B. R. Taylor, of the Noonday and Red Cloud; C. H. Golding, of the Tioga, and R. K. Colcord, of the Syndicate. All these gentlemen expressed a high opinion of the character of the development, especially as to its indications of permanency. The rich portion of the vein continues to widen as greater depth is attained. Superintendent Steel has doubled his force of men, and the work of developing this rich vein and prospecting the 314 level will be prosecuted as rapidly as possible. Our representative, who visited the development Monday afternoon, took the following samples, the first two being taken as an average of the vein at different points, and the last two were selected. The assays were made by A. Soderling:

	Gold.	Silver.	Total.
No. 1	$12 75	$329 80	$342.55
No. 2	23 05	132 50	155.45
No. 3	159 45	916 10	1,075.55
No. 4	55 80	363.50	419.31

PLACER.

DRIFT MINES AT DAMASCUS.—Placer *Herald*, Sept. 23: In the Bob Lewis claim, at Damascus, we understand they have a fine body of rich gravel. The owners of this claim have prospected it persistently. They are worthy men and deserve success.

In the Mountain Gate claim they are running the main tunnel ahead with the view of sinking to the bedrock lower down the channel, and then working up stream to avoid the trouble they have heretofore experienced with the water. They have struck pay, however, east of their main tunnel, and by working in this direction they will be going up stream, a condition that will facilitate drainage. There are a lot of good, hardworking and worthy men in this mine, and any development that indicates their further success is particularly gratifying.

THE Hogs Back claim, over the ridge from Damascus, which has been persistently prospected for years, is now, we are pleased to say, producing good pay gravel, and showing up very encouragingly.

SIERRA.

UNION MINE.—*Mountain Messenger*, Sept. 23: The Union drift claim, at Gibsonville, is proving to be very rich. It is one of those claims that it was supposed had been worked out years ago. But the owners had faith, and pushed their tunnel back into the hill until they found a deposit of gravel that pays $8 to the carload, and there appears to be a very large deposit of gravel. The tunnel is now 7,000 ft long. This will bring renewed life to Gibsonville.

TUOLUMNE.

PATTERSON.—Tuolumne *Independent*, Sept. 21: The Sonora foundry has completed four large mortars for the Patterson mine. The crushing capacity is being enlarged to 20 stamps, 10 of which are probably now running on ore. Several of Drake's amalgamating and grinding berdans will also contribute to the success of the gold-saving apparatus.....Romans, Cowie & Shepherd, of the Sonora foundry are at present running a large force of men on a rush of work. They have just completed, for the Green mine, an 8-inch jack-head pump, with 4-ft stroke; also a set of hoisting works, which are capable of raising over a ton.

NEVADA.

WASHOE DISTRICT.

SIERRA NEVADA.—*Enterprise*, Sept. 24: The north lateral drift on the 2700 level has been extended 27 ft; total length, 693 ft.

CON VIRGINIA.—The joint California southeast drift on the 2700 level has been advanced 15 ft.

CALIFORNIA.—Are still extracting ore from the croppings. During the week bullion to the value of $3,936.84 was shipped.

MEXICAN.—On the 2000 level the joint Ophir winze has been sunk 9 ft; total depth, 94 ft. The northwest drift on the 2900 level is being timbered up.

OPHIR.—During the past week 141 tons of ore have been extracted from the croppings.

CHOLLAR.—The Chollar drift west from the 2000 station of Chollar-Norcross-Savage shaft has been run 120 ft during the past week, making the total length from shaft 220 ft. The ground passed through has been porphyry. No water of any consequence has been encountered. The face of the drift is now in a mixture of quartz, clay and porphyry.

YELLOW JACKET.—The water in the mine continues to rise slowly. It has risen 12 inches since the last weekly report. At the Winter's shaft the north lateral drift on the Sagebrush level has been extended 30 ft. Ground quartz, giving low assays; whole length of same, 303 ft from the switch. On the second level they have reached the old west stopes and commenced prospecting in same. During the week they have reopened the old 6th, or 730 station, and have reached the old stopes east of the shaft from the same. They are extracting about 20 tons of ore per day from the 24, 3d and 5th levels, and have shipped 6 cars, or 48 tons, daily to the Brunswick mill.

COLUMBUS DISTRICT.

NORTHERN BELLE.—*True Fissure*, Sept. 23: Fine progress is being made on the 5th shaft level. An important strike has been made on the 2d shaft level, in the west part of the mine. In a crosscut running south, and 27 ft distant from the main drift, 3 ft of yellow chloride was encountered, which looks very promising. This is located 230 ft farther west than any body of ore ever found on this level. The outlook in the upraise from the 1st level is very encouraging, and some ore is being extracted from the development made there. The other shafts levels present about the same appearance as a week since, and continue their usual yield of ore. A large amount of work is being done in the levels above the adit, with good results. The stopes on the 8th and 9th levels are looking finely, and tureing out the usual quantity of ore. The ore body has been drifted into a distance of 47 ft on the 10th level. It varies in width from 2 to 12 ft, and now shows 2 ft of an excellent quality of ore in the face of the drift. The winze from this level is down 20 ft, and still in ore. In the crosscut started from the 11th level to meet this winze, a distance of 18 ft has been made during the week. Owing to the hardness of the ore now being extracted, only about 55 tons are sent to the mill per day, this being sufficient to keep the mill running steadily. The bullion shipments amounted to $10 212 70 for the week ending Sept. 25th, and the aggregate $49,610.00 on September account to the same date.

MOUNT DIABLO.—The winze started near the bottom of winze No. 2 is down 10 ft, and is showing 6 inches of $50 ore in the bottom. The east drift from winze No. 4 has reached a length of 72 ft, and shows streaks of chloride in the face. The west drift from the raise, nearly north of the shaft on the 2d level, shows a strong body of low-grade ore, with spots of a better grade, which gives assays of $50 per ton.

GENERAL JACKSON.—A small shaft is being sunk about 100 ft east of the Silver winze, and shows favorable ground for ore. Small bunches of ore are being developed in the shaft that give low assays.

COLUMBUS CON.—The long-wished for connection between shafts Nos. 1 and 2 is completed, and good air will be had without further trouble. The drifts for this connection have been pushed as rapidly as possible, but, owing to the circuitous course of the vein, which the drift followed, much delay was caused. Vigorous work will now be resumed in all parts of the mine.

CORNUCOPIA DISTRICT.

CORNUCOPIA MILL ATTACHED.—*Times-Review*: The tailings mill at Cornucopia, together with bar of bullion in transit to this place, was placed under attachment on Saturday last by Deputy Sheriff Al Parker, at the instance of E. Reinhart & Co., of Winnemucca, for the sum of $15,000.

EUREKA DISTRICT.

A NEW FIND.—Some samples of ore were sent down from the Eureka tunnel yesterday, taken from a shaft being sunk for furnishing air to the drifts from which the ore is being extracted. This is a new find, wholly unexpected, and may result in something of importance, as it is 112 ft from the vein from which the ore is now being extracted.

THE RICHMOND.—Ruhy Hill *News*, Sept. 20: At the Richmond for several months past, although the indications have been encouraging, the yield has not been so large as might be desired, and the consequence has been a general slackening in the work of the company. It was even feared a few weeks since that the furnaces would have to be closed down to await developments. New ore in considerable quantity was, however, opportunely met with, and a large amount of custom ore fell in to avert the trouble, and the furnaces are working as usual. Such a condition of affairs necessitated the shrinkage of all demands for wood, coal and other supplies, and to this may much of the dullness in Eureka be attributed. We are pleased to announce, however, that matters at the Richmond are assuming a much more encouraging aspect. Ore has been met with in fair quantities on the 7th, 8th and 9th levels, and, in fact, that on the 9th is of a more than usually high grade. These bodies are, of course, as yet comparatively an all, but they have the advantage of being in deep and unexplored ground, and the indications surrounding them, measured by the rule of experience, are of the very best. The formation in which they are found is of a broken character—the same as has heretofore been a concomitant of the large deposits—and at any moment a famous bonanza is likely to be cut into. If such an event should occur, and the management of the company could be warranted in putting on a large force of miners, and laying in a stock of coal and wood, there would be such a revivification of times in Eureka that it would amount to almost a boom. Such a thing is more than a possibility; it amounts to a promising probability.

LEWIS DISTRICT.

BETTY O'NEAL MINE.—Lewis *Herald*, Sept. 23: The ledge has been encountered on the 264 level, and is extremely rich in black sulphurets. Ledge is pitching east, and is the best defined ledge discovered in the mines, and is from 16 to 18 inches wide. Eight-hour shifts are drifting both north and south, and will continue to run crosscut west. Have started a raise in north end of upper level, with good indications. Stopes in south end, upper level, continue to produce the usual quantity of ore.

NORTHUMBERLAND DISTRICT.

WORK OF DEVELOPMENT.—From County Commissioner A. H. Spaulding we learn that the work of development is being prosecuted with great energy in the mines at Northumberlaud. The ore extracted is of a rich quality, and there are good quantities of this same class of ore exposed in the mines. It is confidently believed that in the near future Northumberland will prove one of the best mining districts in Nye county.

TYBO DISTRICT.

DOING GOOD WORK.—Belmont *Courier*, Sept. 20: From County Recorder Matt. R. Delano we learn that the Tybo mill is running nicely, and doing good work. On Wednesday last, Mr. Trowbridge shipped the 28th bar of bullion which was valued at over $1,700. The 2-O is looking well, and considerable rich ore is being extracted from it. The fact is, there are several good mines in Tybo district, and it is but a question of time when all the mining properties in that section of Nye county will be systematically and profitably worked.

WHITE PINE DISTRICT.

CHEERING NEWS.—Eureka *Sentinel*, Sept. 22: The news from Hamilton is better day after day. Since our recent report of the rich find in the Rescue, which is situated about a mile below Hamilton, later reports from the mine are still more flattering. The shaft is now down 22 ft, 14 ft of the east side is in ore, and portions of the north, south and west sides with every indication of ore body. The ore body is principally chloride, with some bromide and horn silver. Various assays have been made as the shaft was being sunk. The outcrop is a body of quartz some 40 ft in width, all of which on the surface runs from $15 to $20 per ton. At a depth of about 12 ft, an assay was made of once piece weighing about 20 lbs, which went $466.24. Between this point and the surface assays were made that showed between $300 and $700. On the 17th of this month an assay was made of ore about 19 ft below the mouth of the shaft, which went $1,231.59. On the 18th another assay was made from the ore at a depth of 21 ft, which went $1,324 82 and $4 822.02. Next week the work of chamberieg will be commenced, and the extent of this definitely ascertained. It is the opinion of all the miners who have examined the prospect that the indications are more than favorable for an ore body. The people of Hamilton, who have been waiting so long for something to turn up, are all feeling very good. If expectations are realized in the Rescue, the place will at least become a substantial mining camp once more.

THE Stafford, Original Hidden Treasure and Jacobson's mines are all looking well. Wood is being hauled to the Smokey 10-stamp mill, which will be ready to start in about 30 days. Ore is being hauled from the Rescue, Stafford and Hidden Treasure mines. When the mill starts up, there will be ore enough to run it for an indefinite period. On the whole, the Sweetwater Co. is to be congratulated on the flattering outlook of their property.

STRIKE ON TREASURER HILL.—Eureka *Sentinel*, Sept. 20: By private advices from Hamilton we are informed that in Eugene N. Robinson's mine, the Rescue (Truckee), at a depth of 20 ft, in the new shaft, rock running from $400 to $500 per ton was struck last Saturday, and that developments are being pushed forward vigorously from that depth.

ARIZONA.

TOTAL WRECK NOTES.—Tombstone *Republican*: From Mr. A. J. Mitchell, who has just returned from a week's sojourn in Pima's greatest mining camp, it is learned that in 30 days the 20 stamps of the Total Wreck mill will drop upon the accumulation of ore that has been as marked a feature of that mine as was the fat dump of the Grand Central for months before the mill of that company commenced work. The Total Wreck mine is developed 300 ft deep, and by levels covering 300 ft of the vein. These exploitations reveal ore—ore everywhere. It is estimated that there is sufficient now in sight to produce $4,000,000 in bullion. At no point where explorations have been made has it come to the end of the bonanza. This is destined to become one of the historic mines of Arizona, if not of the world. There are numerous other good prospects that await the hand of development, that make nearly or quite as good a showing as did the Total Wreck. Among these is the Forty-nine mine, situated about 2½ miles from the first-named property. There is a shaft 100 ft deep on this mine, with one drift 50 ft long. The ledge is 7 ft wide, of quite as good a grade of ore as the Total Wreck; that is, $60 free milling ore. This district must attract a great deal of attention when the bullion flow once begins.

TOMBSTONE.—*Epitaph*, Sept. 21: This week's review can reveal nothing strange or startling in the mining world. Everything pursues the even tenor of its way. The work of development in the young and partially untried mines is continued with vigor, and the number is daily augmented. The great producing mines are running along without visible change, the mills are all pounding away, bullion is being produced, and everything wears a cheerful aspect. There is hardly a doubt left now but that the sinking of the combination shaft on Contention hill will be commenced ere long. This will be a work of vast magnitude, and cannot fail to give a stimulus to all branches of mining industry in the district.

BIG BUG.—Prescott *Courier*, Sept. 19: Billy Gavin and another gentleman, whose name we cannot recall, arrived here Sunday afternoon from Big Bug mining district, where very promising mining properties are now being opened. A sample of a very large vein owned by Messrs. Gavin and Boggs is now in our table. Assays made of this ledge by Prof. Shafer gave very good results.

COLORADO.

DIRIGO AND NOROM BEGA.—Cor. Bowlder *News and Courier*, Sept. 21: The Dirigo and Norom Bega tunnels are situated on Four-Mile, at what is known as the Old Hoosier mill. The Dirigo tunnel is now driven 300 ft into the mountain. For the first 500 ft it will gain a depth of 1 ft for every foot that it is driven. It is in the nature of a crosscut, the object being to cut and develop a group of some 30 known leads, one of which is the extension of the now famous Yellow Pine, which it will cut at a depth of 300 ft from the surface. The Norom Bega tunnel is now run into the mountain 100 ft, and is also a crosscut, for the development of a group of 30 more known leads, one of which it will tap at a depth of 1,100 ft from the surface.

CASCADE DISTRICT.—Georgetown *Courier*, Sept. 21: Mr. G. F. McKeynolds, of Cascade district, was in town on Monday, and reported that mining matters are progressing finely in that district. Considerable prospecting is going forward, especially at Bullion Camp, at the head of Ute creek, opposite Silver creek, where a number of good strikes have lately been made, but the district still suffers by the lack of roads, which would enable the miners to ship their ore at a reasonable cost.....At the Financier lode, owned by Bosewick & McClure, of Alpine, and Reddell & Bell, of Cascade, the shaft has been sunk to a depth of 16 ft, and has yielded 100 sacks of ore, which, last week, were shipped to the smelting works at Golden. The ore vein is about 1 ft thick, and carries a large amount of native silver.....At the Humboldt the adit, which is now in 200 ft, is being steadily driven ahead under contract. The shaft on this lode has been sunk 130 ft and a drift driven from it 30 ft, the ore vein being from 2 to 3 ft thick, of very rich, free milling gold ore.....The Eclipse lode, owned by Denver parties, is being worked by Hickey & Co, under lease, who are engaged at sinking a shaft from the adit level, which has now reached a depth of 65 ft below the adit and 215 ft from the surface. They have a 6-inch vein of nearly solid gray copper, that mills over 1,000 ozs of silver per ton.....On the Charter Oak, owned by the Lebanon company, Hong & McOllum, lessees, are drifting and stoping about 20 ft from the surface on a 12-inch ore vein that mills about 125 ozs dressed into one class.....At the Great Eastern, owned by Doyle, Languish & Bearce, a winze is being sunk on a good-sized ore vein, worth about 150 ozs, which is improving in both quantity and quality with depth.....The Argo lode is a new discovery owned by Rudberg & Elliott, of Idaho Springs. The shaft has been sunk to a depth of 65 ft, and has exposed a vein of ore 8 inches thick which has assayed as high as 1,100 ozs gold and from 400 to 500 ozs silver per ton. There are 7 to 8 tons of ore on the dump ready for shipment, and a whim is being built for the further development of the property.

IDAHO.

SHOWING UP RICH.—Wood River *Times*, Sept 20: The Eureka mine shaft has been sunk to a depth of 70 ft below the water level, where a vein of 4 ft of solid high-grade galena ore has been cut into, and it is one of the best showing mines to-day in Bullion district. Eighteen months ago it was offered to anybody by the locators for $2,000. Col. Wall and Marshal Shaughnessy purchased it at $2,200, and placed men at work upon it. Within 5 days the ore body was cut into, and the property sold out, on the 6th day, to the purchased under $50,000. The development since are encouraging in every way, and the strike last week, at the lowest level, confirms the high opinion entertained of the value of the property.

A 2,000-FT TUNNEL BEGUN.—Prof. Jenney has started a tunnel, near Bullion, to tap the Durango group of mines. The tunnel will be fully 2,000 ft in length, and will cut the veins at great depth. It will be 5 to 7 ft, and will require 2 years to complete. The Durango group of mines is reported to be very valuable. It is owned by Craig, Chambers & Co. The tunnel enterprise will involve an outlay of a large amount of money, and, when opened, the mines will afford employment to a large number of men.

FIVE HUNDRED DOLLARS "DRY" ORE ON THE WAY TO THE SMELTER.—J. S. Wallace, superintendent of the Solace M. Co., Vienna, is in town, having come down to look after about $50,000 worth of ore from the mine on the way to the Philadelphia company's smelter at Ketchum. The ore is now between Galena and smelter on Dickinson & Bramble's freight teams. Everything at the mine is in fine working order, and ore is being extracted rapidly. Mr. Wallace will return to the mine this week. The ore on the way is expected to go about $500 per ton. It is "dry" or milling ore.

ANOTHER IMPORTANT STRIKE.—Wood River *Miner*, Sept. 20: A new and rich strike has just been made upon the Allen group of mines, on Warm Springs creek. This group is situated in the gulch traversed by the main wagon road, 5 miles from Ketchum, and is only 4 miles from the Ketchum smelter, with an easy down grade all the way. The strike was made in the tunnel at a point about 50 ft in, where the ledge was cut 35 ft below the surface. A body of ore 5 ft through was encountered. Lying upon the banging wall are 2½ ft of black carbonates and galena, mixed with whits lime, and the ore assays 336 ozs in silver and 67 in lead. Adjoining this is 2½ ft of solid black carbonate and galena ore, which is not yet assayed, and which extends to the footwall. Adjoining this again, and seemingly the footwall, is a body of sand carbonates not yet prospected. The vein is opened at other points by 2 shafts, 50 and 60 deep, each showing 9 to 15 inches of ore, the shafts being 1,500 ft apart on the vein. There is also another tunnel 55 ft in, which shows good ore. The vein is a fissure in lime formation, and is the south extension of the Black Hawk and West Fork mines.

MONTANA.

SUMMIT VALLEY MINES.—*Inter-Mountain*, Sept. 22: Occasional visitors to Butte pronounce the city quiet. Were they to visit and inspect the work being done in the great properties on which the town is sustained, their opinion would be changed. There is no external evidence of the great amount of labor being performed in our mines. The bullion shipments have weekly aggregated a sum of over $50,000—near $2,000,000 in ore, copper, silver, gold ores and copper matte sent elsewhere for treatment will swell the value of the weekly exports to a large amount. We do not think $20,000 too large a sum for the actual value of the mineral and bullion exports made weekly from this district. The shipments of the Lexington company are not given to the press. The mine is extraordinarily rich, a recent strike having been made where the ores carry a large percentage of gold. The 50 stamps of this mill would not be dropping, and the enormous expenditures necessary for the construction of the works of the Lexington company would not have been made, were the proprietors of the mine not certain of a rich reward for their faith in the undertaking. On many valuable mines the work is confined to prospecting and uncovering the ore bodies. The owners of some of the properties have in contemplation the erection of mills or smelters, or can afford to wait until a competing line of railway lessens the cost of mining supplies, and their ores will yield them a larger return than they can be worked for to-day. Some remarkably rich ore bodies are uncovered, and the veins being made ready for stoping, while not an unnecessary ounce of ore is brought to the surface. Summit Valley district has a prosperous future in store. The indications were never so favorable as to-day. A number of mines were visited yesterday, and without exception, the owners expressed themselves content, not only with the present returns, but with the evidences of permanence of the ore bodies and their increased richness.

GLOSTER NEWS.—*Inter-Mountain*, Sept. 23: Mr. J. G. Monaghan is in the city, and from him we learn that the hoisting works contracted for by Monaghan & McDevitt are complete, and have been accepted by the owners of the Gloster mine. The building for the engine, hoist and gallows frame is 36x30 ft in size. Additions to the building are a carpenter shop 20x30 ft, and a boiler room 20x40 ft. The town of Gloster is rapidly growing, and nearly all the inhabitants of the towns of Belmont and Vestel have removed to Gloster. Numerous new and substantial buildings grace the town, and a new city hall has been contracted for.....The two mills, one of 60 and the other of 20 stamps, are running constantly and successfully, and from 110 to 120 tons of ore are worked daily.....Mr. Monaghan is still of the opinion that the Gloster is one of the best mines in Montana. He leaves for that point in the morning, and expects to remain there during the winter. He will at once commence work on the erection of an extensive ore house.

MARYSVILLE.—Helena *Independent*, Sept. 24: The Parker and Griff ledes, near the Bald Butte cluster, head of Silver creek, are turning out to be better than the most sanguine expectations of their owners. A run of 57 tons a few weeks ago in the pony stamp mill returned $28.32 per ton saved. These two claims embrace 3,000 ft along the vein. A number of openings have been sunk down some distance, and a third is now under way that shows about 5 ft of high-grade ore from the surface down.....There are several other good showing mines near those above mentioned, that for want of milling facilities at the time of their discovery excitement did not gain much notoriety. Gradually they are coming to the front, and before long the region around deserted Vestel will be densely populated as ever, not a stampede or excitement, but a steady, healthy growth, which will be permanent.....At Mount Pleasant the mill is running on blue lime ore. Messrs. Cotter & Hickey have caused the excitement roll up and down the gulch past them. They have stuck like heroes to their claims, developed them in good shape, and are now enjoying the harvest brought on by industry and faith in their mines.....Belmont is nearly as quiet as a country churchyard at the midnight hour. Next season it is expected the 30 stamps will be in motion, and some of the old time life restored to the camp.

NEW MEXICO.

NACIMIENTO DISTRICT.—*Mining World*: A day and night shift is kept constantly at work in the Eureka mine taking out ore, a large quantity of which is now on the dump.

IT HAS been known for a long time that there were some of the largest copper deposits in the world in the Nacimiento mining district. The New Mexico and Illinois mining company has been engaged for some time in developing their claims, and in the past few months has accomplished a great deal.

A COAL mine has been opened near Copper City, where excellent coal has been found. The vein which is now being worked is 6 ft thick. The same coal has also has a saw mill, which is cutting between 6,000 and 8,000 ft of lumber every day, for which a ready market is found in the immediate vicinity.

CABALLO MOUNTAINS.—Hillman, Anderson & Co. are pushing work on the Good Hope, which is a galena lode running high in silver. They have 5 men at work on the Hard Case, which carries about 15 % of copper.

THE Jim Blaine mine, in the San Christobal mountains, looks well. It has steadily improved with depth, and is now considered the best mine in the range. It is down 100 ft, and carries a solid vein of galena, which runs very high in silver.

PETERS & SMITH have a 25-ft tunnel on the Philadelphia, and are taking out good ore. They have reached a depth of 30 ft on the Silver Trail. It carries an 8-ft vein of galena, which runs from 17 to 25 ozs.

THE Caballo mountains are rapidly coming to the front with development. Before next spring that section will be shipping bullion, and stand prominent among the mining regions of New Mexico. The ore is not high grade, but it has a good average. Copper exists in sufficient quantities to return a handsome profit.

BURRO MOUNTAINS.—*New Southwest*, Sept. 23: A big strike has been made in the 150 level of the St. Louis mine, by the discovery of an immense body of azurite, with some carbonate ore, which bears a great similarity to that of the Copper Queen of Bisbee. One of the new claims upon which active work has been commenced, is the Boston Queen, an extension of the St. Louis lode on the south, owned by Messrs. Stebens, Col. P. R. Smith and J. W. Fleming. This claim is attracting a great deal of attention, and is being prospected most vigorously.

THE Pittsburg, owned by the Valverde mining and smelting company, and being an eastern extension of the St. Louis, is another claim upon which work has been commenced since our last.

OREGON.

STERLING.—Jacksonville *Times*, Sept. 23: The Sterling mining company finished cleaning up this week, after a very satisfactory run.

CAPT. KELLEY, encouraged by results of last season, will operate on a larger scale at his Cayote creek mines this winter.

IT is said that Messrs. Pierce, Mulkey and Lwyer are sinking prospect shafts in the creek bottom at A. P. Tallent's place, on Wagner creek.

D. FISHER informs us that some mining is being done on the big bar of Rogue river. Mr. Jamison has found excellent prospects there and good diggings are promised soon.

MINE.—John Bolt, the genial Applegate merchant, was in town this week, from whom we learned that Derickson & Co. expect to have their quartz mill on Horsehead, Josephine county, running next Monday.

RETURNED.—Wm. Bybee has returned from California, and is now near Waldo, Josephine county, looking after his mining interests. His company is building a new ditch several miles long, and will also repair their old one, all of which work they expect to have completed in the course of a few months.

SLATE CREEK.—The property known as the Josephine mine, situated in Slate creek precinct, Josephine county, will be sold at Kerbyville next Monday by Hon. W. E. Gilbert, Master in Chancery, together with the ditches, appurtenances, etc., belonging thereto. Here is an opportunity for some one to buy a good piece of mining property.

GALICE CREEK.—A correspondent writes: While at Galice creek I visited the English company's diggings, which, I have been informed, are about to be sold. This ground, although it may not pay a large company to work it, would provide employment for several miners or many years. The Ankeny diggings would also make quite a little camp and give profitable employment for years.

UTAH.

GENERAL NOTES.—Salt Lake *Tribune*, Sept. 24: The past week has been unusually quiet. Bullion receipts have been about one-third less than ordinary, by reason of the shutting down on the Hanauer smelter, and the part closing of the Germania. The Hanauer was closed for repairs and renovation, and will start again during the week with renewed efficiency and energy.

THE part closing of the Germania was because of the improvements being made. The company is erecting two large brick buildings, in addition to the already extensive plant. These will be used for the new operations of making white lead and sheet lead, the plant for which will be put in with all possible speed. Afterwards it is the design of the company to add works for making lead pipe and shot. Altogether, the new operations will be of the greatest possible interest and importance to the whole Territory, which has heretofore been sending its enormously heavy lead out in crude shape and buying it back after it was fashioned into useful shape, at a heavy advance in price, and also paying exorbitant freights each way. This new scheme is in the interest of true political economy.

COL. FERRY has returned from the East, prepared to refit and extend the operations of the Marsac company. The various works are going on steadily, and the Pinyon Hill compromise is still gradually drawing near completion.

THE glorious old Ontario, with its output of nearly $2,000,000 so far this year, has paid 9 dividends in 1882, one regularly every month of $75,000 each, aggregating $675,000 in all. It will undoubtedly continue to do the same for an indefinite number of months to come. Its outside works, the long tunnel and the west shaft, are all progressing as fast as possible.

The Mining Liar.

Says the *Colorado Mining Review*: We have all heard of the fish liar, the snake liar, the hear liar, and the whole host of other liars with which the world is afflicted, and while willing to admit that many representing the classes of liars mentioned are entitled to favorable consideration as such, yet the mining liar stends without a perallel. The latter individual is the most dangerous of the lot, for while no one is foolish enough to place any credence in etatements of the others, there are nearly always people to be found, who, while acknowledging within themselves the improhability of the story told, yet go so far as to test its truth. To do this properly they are obliged to spend their time and money, and the consequence is, that hy giving hesd to the plausible talee of the mining liar, they are out of pocket and in humor to declaim against the truth of anything that may be told them concerning a mine. How true this is, only those whose experience has brought them into personal acquaintanco with the mining liar, and who have "run down" some of his prevaricetions, can fully understand. The individual of the kind alluded to is as much a drawhack to a camp as is the claim owner who will neither sell his ground for a reasonahle figure, nor work it himself. Particularly is the miuing liar happy when away from home he can get innocent people to listen to his exaggerations. He will tell them in a manner as ignorant as it is boastful, of the wonderful things to be found in the mine of which, by some means, he has secured the "handling." Sometimes he will succeed in ensnaring a victim, who after a while ascertains the truth, and sometimee he will succeed in inducing a mining man to visit his property for the purpose of examination. In either case the end is the same. The one will howl about the misrepresentation of mines, and the other by reporting against the property, will, to a certain extent, prevent others from going to look in the same locality. Thus, while apparently a mining liar hurts only himself, the fact is that he indirectly damages any district in which he may have located himself. He should be incontinently sat down upon by all houest miners and claim owners, whose endeaver it should be to see that the trnth as nearly as possible is all that is told of their camp. We might add that the exposition has brought a few specimens of the mining liar to Denver this summer.

Results in the Western Mines.

Greater interest concentrates in the mines of the western division of the district than elsewhere. This is because of the newness of the field, it having been tabooed by mining men up to a very recent period. The only saving operation to the ahove etatement is that of the Stonewall, which had been worked sporadically up to its purchase hy the Boston and Arizona Smelting and Reduction Company last fall, since when it has been worked in a syetematic manner, and with good results. One reason for this condition of effairs was the abandonment of the Lucky Cuss after it had made a record of $40,000 in hullion. As soon as work was suspended upon it, every claim in that vicinity received a black eye. Another hlow was the Sunset Hasco. These two claims should hs placed in the same category, both being the subjecte of mismanagement. Starting in upon the surface with rich ore, the moment that gave out work was suspended, and the mines pronounced a failure. The truth of the case is, that neither one of theee mines is a failure in the eenee of a known fact. Neither one of them hae been proepected bsyond the extraction of the eurfaoe ore, at which point they were abandoned. That there is a strong probability of the Lucky Cuse turning out a good mine, no person familiar with the ground will douht. Standing upon the apex of the hill, and tracing the couree of the Luck Sure ledge (what the foreman denominatee the small ledge), its course ie direct for the workings on the Lucky Cuss, and extending the line it etrikee the Old Guard. From the perfectly defined fiesure disclosed wherever work has been done upon the Luck Sure location, which covere at leaet one-half tbe length of the claim, the evidence of ite horizontal continuity over the length of the three claime ie almoet concluaive. That thie is a true fissure, every foot in depth attained upon it conclusively proves, and that when the outer shell of the hill, whicb is hide-hound with dolomite, ie once passed, the ledge will expand, is being atteeted in the bottom of shaft No. 1, which ie now down 80 ft., the ledge steadily widening and aseuming a more flat angle, which ie calculated to take it at 500 or 600 ft. directly under the center of the mountain. With this, and the eteadily improving condition of the Little Devil, confidence ie rapidly etrengthening in the western mines of the district.—*Tombstone Republican.*

Mines in California which were abandoned 30 yeare ago are again receiving attention, and many of the districts which had been given over to Chinamen are now being worked by white men. It ie likely that there are greater fortunes in some of theee old claims than the pioneers ever took out of them. There are now thouesande of men who are quietly working placer minee on their own account and making much hetter wages than could he obtained at any trade. Thie ie infinitely better for the State than if they were all owned hy a few speculative corporations.—*Oakland Times.*

Central Utah.

The mineral zone of central Utah may be appropriately stated as heing comprised within a parallelogram, lying between the 39th and 40th degrees of north latitude, and the 111th and 113th parallels of longitude west from Greenwich.

Within the area there are seven mining dietricts containing in aggregate, about 700 square miles of mineral land. The most prominent in point of development at the present time is Tintic mining district, which is situated immediately eouth of the 40th degree of north latitude, and west of the 112th perallel of west longitude. This district will become famous in the near future as a copper matte producing center hy the inaugeration of that class of enterprise upon an extensive ecale at the reduction worke of the Mammotb mining company in Tintic valley.

West Tintic mining distriot is situated on the Westerly slope of the Onoqui (or Skull valley) range of mountains, which is comparatively low in altitude, and traversing the Territory in a northerly and southerly direction from great Salt lake, to the confines of the great desert on the eouth. Its geological structure ie huilt up of rocks, of the aozoic and paleozoic eras consisting of granites, porphyries, limestones and quartzites; silurian schists are also abundant. These etrata or formations are conformable with each other, and conrse in a northerly and eoutherly direction in comparatively regular parallels. The largest proportion of the ore veins are found upon the line of junction of two formations, and are what is classically termed "contact lodes." They are opened altogether by shafts ranging from 20 to 100 ft. in depth ehowing a vertical dip and somewhat irregular vein formation, ranging in average about three feet in width; smooth walls and clay selvages are not apparent.

The most notable mining property, in the past as well as present, is the Scotia, situated near the center of the district, and in limestone; it is opened hy four shafts to a deptb of 200 ft., upon the vein which inclines slightly to the west from a vertical plane. It averagee about four feet in width. This is an old location and was worked several years ago quite extensively; the ores extracted ranged in assay by large quantities about 25% lead and 26 ozs. silver per ton; the vein product is largely carbonate lead ore with occaeional bunches of galena; in some portions of the vein, hlue carbonates of copper and iron occur of low percentage, carrying in assay from a trace to a few dollars in gold per ton; this mine ie eesily accessible and is prospectively a valuable property.

The Carpenter lode ie soutbwest from tbe Scotia, about a mile; is a contect vein between limestone and quartzite; is opened by a ehaft 160 ft. in depth, exposing an irregular vein formation, ranging from one to six ft. in width, carrying in the center of the vein carbonate of lead and galena, assaying in quantity 25% lead and 25 ozs. silver per ton. The largest proportion of the vein product consists of copper carhonates and iron, carrying small quantity of silver and traces of gold per ton.

The Queen Bee is situated about a mile eoutheasterly from the Carpenter lode, and is evidently a contact vein between limestone and quartzite. The discovery was made about 50 ft. easterly from line of contact upon a spur running into limestone. A shaft has been carried on an incline toward the line of contact. The oree extracted are carbonate lead and galena, aseaying 30% lead and 10 to 20 ozs. eilver per ton.

The Oak Creek mining district is eituated nearly due south of Tintic, ahout 50 miles, and poseibly in a continuation of the Oquirrh mountaine. The rocke composing this district are aleo of aozoic and paleozoic era, coneisting of granitee, eyenite, porphyry, schiete, quartzitee and limeetonee. The only discoveriee of minerale worth mentioning have been quite exteneive depoeits, or beds of iron of the hematite clase, carrying eome eilver and gold in aseay. The district is well timhered and watered, and distant from the Utah Southern railroad abont 15 milee.

There ie no prophetic gift required to foreeee the advent in the near future of an era of increaeed and permanent prosperity in the mining and kindred indnetriee of central Utah. The era of discovery ie completing its work; the coal measuree can he estimated by the townehipe and even counties. Iron ore ie abundant and univereally diffueed. The iron oree may be estimated by mountaine, and have been pronounced hy the heet anthoritiee to be the most remarkahle deposite of iron ore yet discovered on thie continent, and that there is no evidence that any other great deposite of iron existe in or beyond the Rocky mountains. The Tintic mountaine contain vaet storehousee of mixed copper, eilver and gold ore, which are being reduced into a eemi-metallic condition, known ae copper matte, at the rednction worke of the Mammoth mining company, in Tintic valley, under the general management of W. H. H. Bowere, mining and mechanical engineer, which is unqualifiedly eucceeeful, economically ae well as metallurgically. Near the eaetern confinee of the Great Sahara, a mineralized zone extends from the 39th to the 40th degreee of north latitude, and containe true fiseure veine, carrying mixed copper, eilver and gold oree, compared with which the copper minee of Chili and Lake Superior will one day fade into insignificance.—*Silver Reef Miner.*

Record Your Assessment Work.

The Lake City *Mining Register* saye too little attention is peid to recording, in the county clerk's office, annual assessment labor on mining claims. If there were more recording done there would be less litigation. It is true that a "Jumper" is required to show that a full assessment hae not been worked, hut the actnal owner is also required to show that the work was done according to law. The value of recording work, however, is most forcibly felt when a sale is about to be made. If the owner or his egent is abroad endeavoring to effect a sale, and the title of the property is questioned, reference is at once made to the county records. If the work has been recorded with other necessary documents, it showe care on the part of the owner. Official record of annual labor has saved many a man'e property, end negleot of this duty has lost many valuable claims. There are a hundred and one reasons why every owner of a claim should have his work recorded. Claim owners who are non-residents sbould be especially particular to have the work recorded, and no contract for assessment work should he let without a clause providing for the affidavit and proof of record. To our readers in the States we cell particular attention to this matter. The coet of record is trifling compared to its value. Please hear thie in mind, or yon may eome day regret it. As a class, our minere are thoroughly honest, but now and then a scallawag tnrns up who will accept $100 in payment for $50 worth of work. If he is required to make an effidavit that be has complied with the law before receiving his money, he will hesitate a long time before swearing falsely.

New Mines.

The recent discoveries of mineral near town continue to be tbe chief theme of conversation among the people, and the scene of the "finde" is thronged by residents and non-residente. Prospectors in wagons, on horses and on foot are wending their way to the adjscent hills, and that which, a week ago, wes a blind trail aorose the park is now the most traveled thoroughfare in the county. This condition of things was to hs expected, and yet the experience is so new to the people of this section that they ssem unable to realize ite full meaning. At the time of our visit, we eampled the ore face between the walls, taking a portion of all crevice matter, and the sample, crushed and assayed, returned $111.20 in eilver per ton. This indicates an unusually high average value for en ore body which measures more than six feet across, and the ownere should remove all donhts by bringing esveral tons down to the smelter at once. By that method only, can the commercial value of the ore and the productiveness of the lode he determined, and if Canyon City is to derive any snbstantial benefit from the discoveries, the vital question of produotiveness or non-productiveness must be settled promptly and incontrovertibly. Let this he done and the fact chronicled that the product of the new discoveries is being marketed with profitable results, and capital will be drawn here to stay for productive purposes, labor will be employed in developing all meritorious claims, languishing industries will be revived, slnggish streams of commerce will be quickened and every person in the community will be benefited directly or indirectly. —*Colorado Mining Gazette.*

South Boise.—The ahove-named stream heade against the headwatere of Smiley creek, one mile and a half or two miles southweet of Vienna. The minee we now speak of in that section were located thie epring hy E Keny, Al Hoekine, J. Condon and J. B. Black, the latter two of Bellevue. Among the locatione are tho Silver Cliff, Blue Silver, Lake View, Black and the Silver Bell. The mines are favorably located within a half circle of three quarters of a mile of the lake known as the Keny lake, and eituated near the eummit of the Keny mountaine. The lake ie rnnnd ae a plate and ahout 200 yarde acroee, only one and a half feet deep at the eidee, and gradually getting deeper until it reaches 10 ft. in the center. At the outlet on the north ie a stream carrying 100 inchee of water. A houee 14x20 hae been built, and work will soon he reeumed on them and carried on all winter.—*Vienna Reporter.*

To Mine Owners.—Miners are reminded that while competition in the sale of mines ie well enough, misrepresentation of each other's property ie not only vile of itself, hnt ie liahle to react. Help each other out, one sale makes many. If your camp ie good, you won't have to wait long after your fellowe have eold out, and if it ien't the lynx-eyed etrangere who are bujing here nowadaye cannot he lied into a purchase. Be fair, be honest, be candid; don't ask too much. Let your prospecte go to the hand that tendere the ready cash, and either sink deeper on what you have left or eeek a new eite. There ie plenty of room for proepecting yet. Plenty of quartz in the ground that hae never yet met the pick of the proepector, and eome of it probahly better than any yet unearthed.—*Prescott Courier.*

Fireproofing for wood may be made ae follows: With three parts of alum and one part of green vitriol, make a etrong, hot eolution with water; make another weak eolution with green vitriol in which pipe-olay has been mixed to the conciatence of a paint. Apply two coate of the firet, dry, and then finish with one coat of the last.

New Mining District.

A new mining district has hsen formed, says the Greenville (Plumae Co.) *Bulletin*, located on the east side of Light'e Canyon, ahout 11 milee from Greenville, and is to be known as the Emerald district, so called from the lake of the same name that lies within the district.

Already eeven locations have been made within the past few weeks. The first by Blough & Harvey, ie known as Lucky S., No. 1. This has been mentioned before; the ledge ie now two feet wide, and the ore is very rich. A later strike by the same parties is Lucky S., No. 2. This vein is five feet wide, and the ore is about the same quality as the other; a steady improvement is found in each, with every additional day's work. Ford and Bsan have lately made three locations; other locators are Hardgrave, Cunningham, Klein and Cottingham. Some excitement is growing abont this district, and very confident assertione are made that it will soon he the most important mining center in the country. A meeting of the various locators adopted the following resolutions:

On motion, William Blough was elected President and A. J. Ford Secretary. On motion, ordered that this sball hs known as Emerald district; that it shall he bounded as follows, to wit: Commencing at the residence of William Peters, and running easterly to and including what is known as the old Gifford mine; thence northerly to the east end of Rat Smith Valley; thence westerly to and including the Spelliar diggings, thence westerly to Light's canyon at the Reynolds cabin, thence follow the foot of the mountain to place of beginning. On motion, ordered that the following hy-lawe he adopted for the future government of the district:

1. That the Recorder of Plnmae conuty shall be the Recorder of this district, and that a copy of all notices of location shall be filed with him for record within 60 days after poeting the same.

2. All quartz claime shall be 1,500 ft. on the line of the lead or lode, and 300 ft. on each eide of the lead or lode of mineral-hearing rock.

3. That the proceedings of this and all subsequent miners' meetings of thie district, shall be filed with the Recorder of Plumas county, attested by the President and Secretary of said meeting.

The Difference Between a Cyclone and a Tornado.

The difference between a cyclone and a tornado is defined hy Mr. William Ferris, of the United States Coast Survey, to be this: A cyclone is usually a broad, flat, gyrating disk of atmosphere, very much greater in width than altitude; a tornado is a column of gyrating air, the altitude of which is several times greeter than its diameter. Cyclones are born of conditions extending over largo areas; tornados depend rather upon the vertical relations of the atmosphere, and occur when, owing to locel changes of temperature, the undor strata of air bursts np through the overlying strata. The enormous velocity of the ascending currents of tornadoss is supposed to he caused hy the difference hetween the gyrating velocities above and those on the surface. It is these ascending currents which carry up the vast bodies of water afterward precipitated in the form of a deluge of rain. The water is sometimes kept from falling hy the ascending currente, and is often projected outeide the area of the tornado, when it falle in a gentle ehower over a large area. When the weight of the water overheare the force of the ascending currente, there occure the tremendoue fall of rain known as a cloudburst. When the area of a tornado ie very small, a land-epout or water-spout may be formed, according ae it is over land or water. The width of these epoute range hetween 2 and 200 ft., and their hight from 30 to 1,500 ft. A white squall ie an invieible epont formed when the dew-point ie low. The accompanying clond ie invisible, becauee of ite hight, hut helow there ie a raging and boiling eea, with a gyrating current of air above it. Land-spouts and water-epouts are hollow.

Out of a Shaft.—A Colorado corresepondent of an Iowa paper ie reeponsible for the following "boee lie:" "Bill Nuckells, a prospector, fell down a proepect shaft 40 ft. deep, right into a nest of hlackenakee. Moet men would have died of fright, but Nuckelle wae not that sort of a man. He tied several enakes together and etarted them up the eide of the shaft, tying a fresh snake ae fast as the rest went up. Pretty soon the head enake got over the edge and started down the hill. Nuckelle kept tying on freeh reptilee until he had used up a couple of hundred—every enake there wae in the ehaft. By this time the crowd of enakee on the outside wae etrong enough to pull him out of the ehaft, and he eoon reached Mead'e ranch safe and sound.

An Ingenious Device.—By thrueting the end of green ecrub wood—"mallee scrub"—in the fire, and catching the sap driven out at the other end in a hark trough, an Australian enplied himeelf with water, and eaved hie life while croeeing a waterless region. He eaye that a dozen mallee eticke, four feet long, and two or three inchee in diameter, would give a pint of water in an hour, and euggeets that the eame device may possibly he found of vital importance to other hneh rangers and travelers in arid regione.

The Engineer.

Utilizing the Force of the Waves.—It is both interesting and instructive to watch the progress of engineering in this direction. *La Nature* describes a recent invention having this object in view. It is an invention of M. Ganchez. It has a float weighing from 35 to 95 tons, as may be required, connected with a bell-shaped compressor by means of ropes or chains, which pass over suitably arranged pulleys. The float, of course, rises and falls with the action of the waves. When the float falls it raises the bell, which had been previously below the surface of the water, and as it empties itself of water the air rushes into it through openings in the top. As the float rises again the bell sinks, the water rises in it, and, compressing the air, drives it out into pipes, which conduct it to reservoirs on shore, where it can be distributed as required. There seems to be a very general effort at the present time to utilize all sources of mechanical power. The discovery of the Faure accumulator has done much to stimulate this. There is no doubt that soon there will be many better attempts than this of Ganchez's to capture "waste" force.

An electric accumulator, which is a vast improvement on the form at present in use, has been introduced by Mr. Kabath. The problem for inventors in this line is to increase the active surface of the plates, without proportionately adding to their weight, for it is at the surface and over a relatively slight thickness that are produced those reactions which give rise to the secondary current. To provide this greater extent of active surface, Mr. Kabath makes each plate consist of 80 or 100 thin strips, alternately corrugated and flat, bound together so as to allow a free circulation of the liquid used. This is a very ingenious arrangement, and a battery of this description should store up much more energy than a Faure accumulator of equal weight; how much, experiment will determine.

Electricity in the Arts.—An electrical railway is used at the linen-bleaching establishment of M. Paul Duchesne-Fournet, at Le Breuilen-Auge, France, to collect the fabric after it has undergone the final whitening process of exposure to the rays of the sun. The train is driven by a locomotive having a Siemens dynamo-electric machine for a motor. The currents to drive this motor are derived from a battery of Faure accumulators contained in a separate vehicle. The train starts from the factory with the wagons empty. It stops when it arrives at the bleach fields. By the movement of a bandle, the motor is thrown into gear with a set of windlass rollers used to wind up the linen.

Closing up.—There is now a gap of a little more than 600 miles between the approaching ends of the Northern Pacific railroad, and this is being closed up at the rate of nearly four miles per day. On the first of this month a daily line of four-horse stages commenced running between the two ends of the line, and by the 1st of October the schedule passenger time between Chicago and Portland will be reduced to eight days, which is less than the present time between the two cities by way of San Francisco. A force of 8,000 men is employed in pushing forward the road, and the whole line is expected to be completed and in running order early in 1883.

Experiments have been made with an electric lamp for locomotives on the system of Messrs. Sedlaczel and Wikulill, on the North of France railway. The lamp is placed in front of the engine, so as to light the permanent way. The experiments have shown that it burns steadily, even when the train goes at express speed; that the light does not interfere with the visibility or the distinctive color of the signals, and that neither the engine-drivers nor officials of the train carrying the light, nor of other approaching trains, are dazzled by it. The drivers are able to see the line distinctly for a distance of 300 yards ahead.

A movement is on foot for constructing a railway across Australia, but the difficulty is the arid nature of the center of that large island. This is hoped to be overcome, however, by sinking wells. It is known that the underlying rock is an almost level bed of sandstone, which is believed to be saturated with water.

A petroleum pipe line constructed from the Couban oil territory over the Caucasus mountains to Novorossiask Harbor, on the Black Sea coast, was opened on May 27th. This line of pipe, which is 105 miles long, can deliver every day not less than 1,000,000 lbs. of petroleum.

Breading.—The "breading" of any article, consists of simply rolling its moist surface in sifted bread crumbs or cracker dust; if the crumbs are unlikely to stick, the article is next dipped into beaten egg, and then again rolled in crumbs. The crumbs should always be sifted so that they may be of one size, and as fine as possible, or they will be apt to fall off during frying. They are made by drying stale bread, rolling it fine, and sifting it through a fine sieve; the coarser crumbs may again be rolled and sifted, or kept for stuffing or puddings. Crackers can be rolled in the same way; cracker dust is sold ready for use.

Useful Information.

Rosewood has been the leading wood to veneer piano-fortes for the past 30 or 40 years. The best comes from Rio Janeiro, some of which is very rich, but varies considerably in different places where it is cut. Bahia rosewood is generally longer, heavier and harder to work, but some of it is handsomely cross-figured. As people generally demand dark-colored rosewood, it has led to staining the light wood very often, which may be known when legs, arms, etc., of furniture and piano-fortes look unnaturally dark. At one time, we used to cut rosewood veneers in ribbons to veneer picture frames, but they soon imitated rosewood to such perfection by staining that the demand for rosewood veneers for picture frames ceased altogether. It is impossible to imitate mahogany, by staining, so as to deceive or to mend bad places in the wood, as is done in other kinds of wood. So says the *Furniture Trade Review*.

Green Corn.—A novel way to serve green corn, and one which is pronounced a notable addition to the house-wife's bill of fare, is as follows: Take one dozen ears of tender corn, choosing ears that are nearly of the same size and those of medium size; grate them; then add one quart of sweet milk, in which you have stirred till free from lumps three tablespoonfuls of flour, a quarter of a pound of butter, or a piece as large as an egg will do; four eggs, whites and yelks beaten together, with pepper and salt to your taste, are all the ingredients called for; butter a large earthen pudding dish, and bake this mixture for one hour; this will be long enough if the oven is hot when the dish is put in. This is to be served with meat and potatoes as a vegetable, though with the addition of sugar, and with a rich sauce, it takes the place of a pudding.

Glass Veneer.—A Boston genius has invented glass veneers. Underneath a plate of glass, is a substance made in exact imitation of the grain of wood, oak, mahogany, rosewood, maple, etc., and the whole attached to the article of furniture, either as a panel, top, or otherwise. The effect thus produced is said to be beautiful in the extreme, surpassing any polish of the natural wood that it is possible to produce. One of the most important features attending these glass veneers, is the great variety of uses to which they are applicable. They are adapted for paneling, dado work, top of center or side tables, mantles, office furniture and even doors.—*Ex.*

A new process for preserving wood has been invented in France by M. Jacques. He first impregnates the timber thoroughly with a simple solution of soap, mixed with an acid—preferably phenic acid. This causes the fermentation in a few days, within the wood, of a fatty acid, which is insoluble in water, and impregnates the remotest fibers. The reaction of the acid on the soap does not take place until a portion of the water has evaporated. It is claimed that more perfect impregnation can be had in this way than with creosote, and there is no danger of the washing out of the preservative from the exposed surfaces, as when sulphate of copper is used.

To Freshen Salt Fish.—Many persons who are in the habit of freshening mackerel or salt fish never dream that there is a right and a wrong way to do it. Any person who has seen the process of evaporation going on at the salt works knows that the salt falls to the bottom. Just so it is in the pan where your mackerel or white fish lie soaking; and, as it lies with the skin down, the salt will fall to the skin, and there remain. When, if placed with the flesh side down, the salt falls to the bottom of the pan, and the fish comes out freshened as it should be. In the other case it is nearly as salt as when put in.

New Belting Material.—A machine belting made of woven camel hair, or a hair known as camel hair, is being manufactured and used in cotton mills in Manchester, England. A test of a belt of this material, 6 inches wide and 0.27 thick, showed a breaking strain of 9 181 lbs., with an extension at the rate of 2·68% at 1,200 lbs., 5 % at 2,400 lbs., 6.60% at 3,600 lbs., and 13.07% at 4,800 lbs. It is said that this belt slips less on pulleys, does not deteriorate to anything like the extent of driving belts of vegetable fiber, and is thoroughly waterproof, and not affected by variations in temperature.

Irish Oak.—The original rafters of Westminster hall were of Irish oak. In early days an idea prevailed that Irish wood was a sort of sacred material and proof against all objectionable reptiles. The venerable Bede lays it down that timber from Ireland "bath a virtue against poison," and after the earthquake of Lisbon, the king of Portugal specially imported Irish oak, presumably from some belief in its blessed qualities, for a magnificent new church.

Coating Wood with Stone.—The following is a German recipe for coating wood with a substance as hard as stone: 40 parts of chalk, 50 of resin and 4 of linseed oil, melted together; to this should be added 1 part of oxide of copper, and afterwards 1 part of sulphuric acid. This last ingredient must be added carefully. The mixture, while hot, is applied with a brush.

Something for the Ladies.—Science has made a discovery of a new method of bleaching white goods. It is as simple as it is said to be efficacious, and is vouched for by German chemists. It consists in dissolving one part oil and turpentine in three parts strong alcohol, and placing a tablespoonful of the mixture in the water for the last rinsing. The clothes are to be immersed in this, well wrung out and placed in the open air to dry—not in a room. The bleaching action of the oil of turpentine consists in its changing oxygen into ozone, when exposed to the light, and in this process the turpentine disappears, leaving no trace behind. It is so simple as to warrant one or more trials.

Mr. C. Weiss, of Mulhsim, has patented in in Germany a new method for manufacturing driving belts with sailcloth. The sailcloth, woven in the ordinary breadth, is folded two, three, four, and even eight folds, according to the breadth required for the belt and for its strength. The folded cloth is then sewed and covered with other cloth of the same material, which is also sewed across so that the seam comes between those underneath. By this outside covering and sewing, the belts are said to be stronger and more durable, as the inside seams are protected.

To imitate ebony, wash any compact wood with a boiling decoction of logwood three or four times, allowing it to dry between each application. Then wash it with a solution of acetate of iron, which is made by dissolving iron filings in vinegar. This stain is very black, and penetrates to a considerable depth into the wood, so that ordinary scratching or chipping does not show the original color of the wood. It is a mistake to mix the solutions of logwood and iron before applying them to the wood, as some recipes direct.

Shoemakers' Measures.—The correct standard of shoemakers' measure seem to be pretty well settled thus: Children's measure is four and three-eighths inches, and that every additional number calls for an increase of one-third of an inch in length. No. 1, adults' measure, is 8½ inches long, with a gradual increase of one-third of an inch for additional numbers, so that, for example, No. 10 measures 11½ inches. This measure corresponds to the number of the last, and not to the length of the sole.

Weight of Coal from Different Woods.—The best quality of charcoal is made from oak, maple, beech and chestnut. Wood will furnish, when properly charred, about 20% of coal. A bushel of coal from pine weighs 20 lbs.; a bushel of coal from hard wood weighs 30 lbs.; 100 parts of oak make nearly 23 of charcoal; beech, 21; apple, 23.7; elm, 23; ash, 25; birch, 24; maple, 22.8; willow, 18; poplar, 20; red pine, 22.10; white pine, 23.

When Keys Are Lost.—When it is not convenient to take locks apart in the event of keys being lost, stolen or missing, when you wish to fit a new key, take a lighted match or candle and smoke the new key in the flame, introduce it carefully into the keyhole, press it firmly against the opposing wards of the lock, withdraw it, and the indentations in the smoked part of the key will show you exactly where to file.

Umbrellas.—Philadelphia manufactures more umbrellas than any other city in the world; the annual production is valued at $20,000,000.

The Carbonaceous Residue from the Solution of Steel in the Double Chloride of Copper and Ammonium.—When steel is treated with the double chloride of copper and ammonium, it dissolves and leaves a carbonaceous residue. Mr. Andrew Blair, in a series of experiments, washed this residue with the above double chloride acidulated with hydrochloric acid, and finally with water, until the filtrate gave no precipitate. Then nitrate of silver was added. A careful examination of the substance then revealed the fact that it contained carbon, hydrogen, oxygen and chlorine, besides a small quantity of nitrogen. It appears probable that the carbonaceous substance is not simply a hydrate of carbon, but rather a carbon compound.

A party of Comstock mechanics, says the *Territorial Enterprise* of September 13th, left here yesterday for Mexico. They have been engaged by William Salkeld, who is interested in some valuable mining property at a place 325 miles from Mazatlan and 75 miles from the city of Durango. From Mazatlan to Durango, a distance of 250 miles, the trip will be made on mules. From Durango to the mines, 75 miles, the party will go by stage. The following compose the party: Samuel Connors, Robert Sellers, Thomas Fisher, Samuel McCleare, Lewis Perrin, Joseph Sparks, J. C. Bryant and Nail Loynahan. The carpenters will receive $6 a day and board, and the others $5 a day and board.

To Sweeten Butter.—Butter that has become strong may be sweetened so that it can be used for cooking purposes, as follows: Add a handful of salt and a teaspoonful of soda to two or three pounds of butter; let come to a boil; pour into a crock and set in a cold place. Take off the top, careful not to disturb the settlings.

Good Health.

Medicine Taking.

After more than 30 years of medical practice, I am fully convinced that the masses take much more medicine than is needful. I will go further, claiming that an utter disuse would be less dangerous to society—an extreme we need not adopt—than the present, reckless employment of all sorts of drugs, with but little thought or care about the nature of the drugs used. While there are a few altruists who ignore all drugs, as they oppose all existing customs, from a mere love of oddity, it may be, there is a strong probability that enough and more than enough of "patent medicines," etc., will be taken, at least, till the whole community shall learn that "an ounce of prevention is worth a pound of cure."

Many "give the reins to their passions and appetites," with the delusive idea that they can do just as they please, indulge all of the appetites, like the swine, or worse. Encouraged by the quacks who say, "Eat what you please while taking this marvelous medicine," they may not know any better, and then expect to escape the just penalty of their sins of gluttony, etc., by taking medicine.

Though medical treatment may modify diseases, mitigate human sufferings, doing the best that can be done under the circumstances, the evils of wrong doing cannot be wholly obliterated. The Bible statement, "The soul that sinneth shall die," might have the same significance when applied to the body. Like the laws of the "Medes and Persians," those of the body never change, are never abrogated, and know no forgiveness. The "pound of flesh" must be granted, since no one can put "coals of fire in the bosom, and not be burned."

It is not the mission of drugs to abrogate God's laws of the body, but to co-operate with the recuperative forces of that body in the removal of existing evils, after the penal authority has asserted its sanctions, to deter from future violations of the sacred conditions of health and vigor, for a moral effect. Prevention is not only easier than cure, but far safer and more economical. The intelligent and honest physician orders drugs when he thinks it right and proper to do so, and then the patient should unhesitatingly take them, or discharge the doctor. The less honorable man sometimes orders them when not needed, simply because of the pressure brought to bear, well knowing that the ignorant will discharge him, and get one who will heed the whims of the sick, thinking it preferable to give some inert medicine rather than give place to a reckless and unprincipled quack.

But the great danger in medicine-taking is the popular custom of taking any nostrum that may chance to be advertised (printers' ink sells anything), neither knowing the nature of the disease nor the compound offered for sale. There is a recklessness in this matter which we do not practice in other respects. Most of this class of empirics know enough of the human system to give some of the symptoms usual in almost all diseases; so that all may find something to resemble their symptoms, and then give one trial, at least.

All should know that medicines, vegetable as well as mineral, are poisonous, at least in their more concentrated forms. As such, they should be employed with the same care that we use other poisons. It would be no more foolish for one to enter a drug store with a prescription from a reliable physician, and then, in the dark, take the contents, in part, of the first bottle reached, than to swallow the various nostrums offered for sale at the groceries, wrapped in an abundance of recommendations, which may be purchased at the small price of one dollar a dozen. It is a matter of but little importance that these nostrums are pronounced "purely vegetable," even if true, since the most poisonous substances in the world are of vegetable origin. Metallic substances, used for medicines, are more objectionable on account of the difficulty in eliminating them from the system, than from their simple, poisonous character.

I repeat, it is injudicious to take medicines at random. It is far safer to do nothing, trusting to nature's wonderful and gracious efforts—always in the right direction—than to "leap in the dark," taking, we know not what, or for what. If human health is of any value, it is of sufficient worth to justify care, intelligence, and seeking advice from those who are supposed to be well-informed in such matters, on the same principle that a "wise builder" has a plan, seeks good materials and good workmen.—*Dr. J. A. Hannaford.*

New Application for Ulcers, Etc.—Medical practitioners are employing a new application for ulcers, sores, etc. They take a hundred parts of plaster of Paris, finely powdered, and coal tar from one to three parts, and mix in a mortar; add olive oil enough to reduce the mixture to the consistency of ointment, and preserve it for use in a close vessel. The mixture is of a dark brown color, and has a bituminous smell. If applied to an ulcer, or running sores of any kind, no matter how offensive, it not only absorbs pus and destroys its fetid smell, but also dispenses with the necessity of employing lint. The oil binds the powder, without dissolving it, so that the compound retains its absorbing quality when placed in contact with a suppurating sore, and it never dries sufficiently to become inconvenient to the patient by its hardness.

SAN FRANCISCO:

Saturday Morning, Sept. 30, 1882.

TABLE OF CONTENTS.

GENERAL EDITORIALS.—The Placer Diggings in New Mexico; The Duncan Concentrator, 209. Passing Events; Influence in Mining Camps; Mineral Claims and Pre-emption Filings; Placer Claims; The Mechanics' Institute Fair, 216. The Denver Exposition—No. 7; The Colorado Iron Works at the Denve. Exhibition; Improved Hydraulic Giant, 217. Mechanics' Fair Premiums; Patents and Inventions; Notices of Recent Patents, 220.

ILLUSTRATIONS.—The Improved Duncan Concentrator, 209. Improved Form of Hydraulic Giant; 217.

MECHANICAL PROGRESS.—New Friction Gear for Wire Ropes; A New Direct Process; A New and Cheap Method for Enameling Water Pipes; Employment of Iron in the Arts; Improvements in Slide Valves; The Smoke Nuisance, 211.

SCIENTIFIC PROGRESS.—Spontaneous Combustion; How the Trees Drink; Formation of Coal from Marine Algæ; Solar Physics; Wood Decay; Archæological; Natural Sulphuric Acid; Ancient Stucco Luster, 112.

THE ENGINEER.—Utilizing the Force of the Waves; Electricity in the Arts; Closing Up, 215.

USEFUL INFORMATION.—Green Corn; Glass Veneer; To Freshen Salt Fish; New Belting Material; Irish Oak; Coating Wood with Stone; Something for the Ladies; Shoemakers' Measures; Weight of Coal from Different Woods; When Keys are Lost, 215.

GOOD HEALTH.—Medicine Taking; New Application for Ulcers, etc., 215.

MINING STOCK MARKET.—Sales at the San Francisco Stock Board, Notices of Assessments, Meetings and Dividends, 212.

MINING SUMMARY from the various counties of California, Nevada, Arizona, Colorado, Idaho, Montana, New Mexico, Oregon and Utah, 212-13.

MISCELLANEOUS.—Contributions to the Ethnology and Geology of the Pacific Slope; El Dorado County Miners' Union; Drainage of Mineral Fields, 210. The Mining Liar; Results in the Western Mines; Central Utah; Record Your Assessment Work; New Mines; New Mining District; The Difference Between a Cyclone and a Tornado, 214.

Business Announcements.

Dividend Notice, Bulwer Consolidated Mining Company.
Dividend Notice, Bodie Consolidated Mining Company.
Annual Meeting, Eureka Consolidated Mining Company.
Iron Mine for Sale, Mrs. D. S. Roblwing, St. Helena, Cal.

Passing Events.

Indications point somewhat to New Mexico as the next place where a good mining boom is to be experienced. Many persons are now prospecting in the mining regions, and considerable attention is being turned that way. The Lake Valley mines, about which so much has been said, will attract a great many persons to look in that direction.

Just now, copper mines in various parts of the country are proving so profitable that people are hunting for that metal everywhere. Mines that have been outfitted with smelting furnaces, etc., are mostly making money very fast.

Many new strikes are reported from the Wood River region, and both Eureka and Tombstone come in for their share this week. It will not be long now before prospectors will have to hunt winter quarters, and give up their out-door work for a while.

CORRESPONDENT.—W. S. Taylor has started on a trip through the mining regions of Nevada as correspondent and agent of the MINING AND SCIENTIFIC PRESS. He will send us descriptions of the various camps and districts, and collect a variety of information of value and interest to our readers. We hope miners everywhere will afford him what facilities they can in furnishing him information.

A NEW furnace has been erected in Chicago for the purpose of testing a new process of treating ores, from which important results are expected.

Influence in Mining Camps.

In the early days of a mining camp, hardly anything is of more importance to it than the character of the men who are at the head of affairs of the leading mining company. If they are progressive, enterprising, honest and skillful, the camp will get a reputation that will stand it in good stead and contribute greatly to its growth. If they are careless, apathetic, ignorant, or untrustworthy; or if they keep making promises they do not meet; or make contracts they do not carry out; or do not make proper arrangements to pay the men when payment is due, the camp gets in "bad odor," and it takes a long time to overcome the prejudices which exist against it.

The superintendent of a big mining company has, therefore, on his hands, not only the welfare of the company with which he is connected, but the welfare of the camp itself.

All the miners who have had any experience in several camps can remember instances where a churlish superintendent or manager has brought his company into disrepute; can remember where an ignorant superintendent has badly injured his company by unnecessary expenditures or foolish operations; and when the mine in question is one which is considered the principal one of the camp, injury is done to all the mines and all the prospects. Failure of a representative mine in any camp will hurt the district badly, as men look to it to prove the value or poverty of the veins or deposits. No matter what the merit of a camp may be, it may struggle on a long time, if ignorance, dishonesty or stupidity characterizes the managers of the leading company. Failure will follow failure until the patience of well-wishers is exhausted.

With men at the head of affairs, however, who are honest, and who, if ignorant of details of mining or milling, have sense enough to employ men who have the requisite experience to carry on matters, a very different state of things exists. If the leading company pays its men, and manages its business in a business-like way, a sort of confidence is established in the camp that is difficult to establish in any other way. Let a poor superintendent be deposed, and a man with determination, vigor, and above all, experience, take his place, and confidence will be restored in a remarkably short space of time.

There is no doubt that now there are many camps on this coast which are retarded more in their growth by the stupidity of the superintendents in their leading mines, than by any deficiency in the mines themselves.

It is not difficult to suggest a remedy for this evil, though it is not easily carried out. If superintendents were appointed for their fitness, rather than on account of some relationship, or friendship of the chief directors; or if, when men were found to be incompetent, they were at once removed, it would be all right. The difficulty is to get the matter properly before the right men. Half the time the superintendent is a man who is put there to carry out some object having, more to do with price of stock of a company than with the actual working of the mine or mills. In such cases it is difficult to get him removed, and few men care to come to the front in an aggressive way and make a fight, which will give them personal trouble, for the benefit of the many.

The thing that is usually done is to wait until the objectionable man becomes thoroughly played out and is removed; but mean time he may have done the camp harm from which it can never recover.

Mineral Claims and Pre-emption Filings

The attention of the mining community is called to the following circular which was received at the Register and Receiver's Office in this city, this month. It was issued by the General Land Office:

Register and Receiver, San Francisco.—GENTLEMEN: I am in receipt of your letter of the 29th ult., submitting the following for instructions, viz.: Should mineral claimants, seeking to perfect title to claims located on prior pre-emption filings and homestead entries, be required, in addition to the publication of the mineral notice and posting thereof, to give personal or published notice to the agricultural claimants, fixing a day for hearing?

A pre-emption filing is no bar to the filing of an application for a mineral patent, neither is a pre-emption claimant estopped from asserting his claim under his filing by the notice given by the publication and posting of the *mineral* notice. The party having a prior agricultural filing, or any other party, prior to the issuance of a patent on the mineral entry, may, upon the filing of the proper affidavits, have an investigation made to determine the *character* of the land.

Paragraph 94, page 30, office circular of Oct. 31, 1881, relating to this class of cases, prescribes the manner in which notice may be given. A prior pre-emption claimant under an unexpired filing, not receiving such notice, would, in the final examination of the mineral entry by this office, be entitled to a time in which to show cause why his filing should not be canceled.

I think, therefore, that although, as herein stated, the declaratory statement filing would be no objection to the receiving of the mineral application. It is your duty to notify all such mineral applicants of all prior agricultural filings, in order that they may give the required notice, which, if given and entered in the record, would greatly facilitate action on the case by this office.

A homestead entry is an appropriation of the land; it must be regularly canceled before a mineral application can be allowed for any portion of the same tract.

If it becomes necessary to investigate as to the character of the land, a mineral claimant initiating such proceedings must make service as required under head "Service of Notice," page 6, Rules of Practice.

Respectfully,
L. HARRISON,
Commissioner.

Placer Claims.

The Secretary of the Interior has issued an important circular to Registers, Receivers and Surveyors-General, with reference to placer claims, amendatory of the circular of October, 1881, in which the mining laws were summarized. It is directed against the consolidation of claims in one application for a patent, and was made necessary by the decision of the Supreme Court in the case of the St. Louis Smelting and Refining Company against Kemp, in which it was decided that the department had authority to allow the consolidation of claims. In the circular the Secretary directs that in the recognization of an application for a patent upon a placer claim care must be exercised in determining the classification of the land, to which end the clearest evidence of which the case is capable must be presented. If the claim be of placer ground, that must be stated in the application, and corroborated by accompanying proofs. If of mixed placers and lodes, it should be so set out, with a description of all known lodes situated within the boundaries of the claim. A specific declaration, as required by statute, must be furnished to each lode to be claimed. All other lodes are by the silence of the applicant excluded from all claim by him. The Secretary calls attention to the clauses of Section 2895, Revised Statutes, which require surveyors to note on their field books the due situation of all mines, salt licks, salt springs, etc., which come to their knowledge; also, all watercourses over which their lands run, and the quality of the land.

The Description

Is to be incorporated in the plat by the Surveyor-General, and the Secretary says if these instructions are followed they will furnish a reasonable guide to the district officers and the claimants in prosecuting their applications, but adds that experience has shown that great neglect has resulted from inattention to the law in this respect, so that regular plats are of very little value. It will, therefore, be required in the future that Deputy Surveyors shall, at the expense of the parties, make a full examination of all placer claims and duly note the fact, stating the quality and composition of the soil, the kind and amount of timber and other vegetation, and such other matters as may be proper upon the survey of the claims. This examination should include the character and extent of all surface and underground workings, whether placer or lode, for mining purposes. In addition to these requirements of the law, the circular says the deputy should report with reference to the proximity of centers of trade or residence; also well-known systems of lodes or individual lodes, and as to the adaptability of the claim for placer mining; whether water has been brought upon it in sufficient quantity to mine the same, or whether it can be provided, and finally, as to the work done by or the expenditures made by the claimants. It requires that the deputy shall report his examinations under oath to the Surveyor-General, a copy to be furnished with the application for patent to the claim and included in the oath of the applicant. The circular also provides that these regulations shall govern all applications for surveys of lands yet unsurveyed.

THE summer season is more or less a dull one in all parts of New Mexico and Arizona, owing to the fact that the heat causes a cessation of prospecting, and prevents the investment of capital. With the cool weather comes renewed activity in all branches of business here; new mines are discovered and opened up; the capitalist is visiting the camp, and seeking an investment for his money; the laborer is employed, and the merchant finds a ready sale for his goods.

WINTER'S INVENTIONS.—J. D. Winters, the well-known inventor of Davisville, Yolo county, had an interesting exhibit at the State fair of his portable derrick, his nets for unloading header wagons, his grab-fork for unloading hay or grain and his Golden Gate Washer. These inventions have been highly spoken of by those who have used them, and Mr. Winters is well known as an ingenious, worthy and substantial inventor.

THE contributions to the Garfield Memorial Hospital fund to date amounts to $80,000.

The Mechanics' Institute Fair.

In another column we give the premium list of the Mechanics' Institute exhibition, which has just closed. A glance at this long list will convey to the mind of those persons who did not have an opportunity to visit the exhibition an idea of the immense variety of things that were there displayed. Of course it cannot mention all that was displayed, by any means, and those things only are segregated which received premiums. It is difficult to give everything well disposed the management may be. In the meritorious its just reward, no matter how multitude of articles on exhibition some things of merit may not be suitably recognized.

Few persons appreciate what such exhibitions do for the community. It is not a mere matter of amusement, or one of advertisement that is accomplished. The city and the State are benefited in equal degree. It shows what the workers are doing, and what they have done. It shows that there are men among us who can do the skilled work that is done elsewhere, and do it as well, too. It illustrates what can be done in the way of manufactures, even in a comparatively new manufacturing region. We are shown a variety of products which would do no discredit to a community much older than ours. In a practical manner is brought before us the ways and means in which so many of the people among whom we live occupy their hands and earn their daily bread, for the results of this labor are here.

In some respects, the fair of this year excelled its predecessors. In one very important particular was this noticeable, and one illustration will suffice. The machinery department, which has always been a prominent feature of these exhibitions, has always contained more or less imported articles, but this year, nearly everything displayed was of home manufacture. It is unnecessary to go into details, but the fact remains that this important department was an illustration of what can be done in the line of mechanics. It was by no means large or very full, but most of what was shown we made ourselves, which is much more satisfactory to reflect upon than if the machinery had been four times as plentiful, and all imported.

The public should recognize and appreciate the fact that the managers of these exhibitions are doing really a service of value to the entire community in carrying them on. As to the exhibitions themselves, the words of a prominent speaker of this city in referring to them are worthy of repetition: "Such exhibitions, and the increasing interest taken in them, evidence a growing improvement in the tastes and morals of the people. It is a favorable omen when so many citizens find substantial pleasure in such an entertainment. There was a gigantic structure in the heart of imperial Rome, erected for the entertainment of the people, but it was devoted to disgusting contests between savage men and beasts. Our crowds gather to admire, instead, the exquisite handiwork of labor and creations of thought. This is an encouraging illustration of the progress and improvement of the race. But we need not go so far back for evidence. Such spectacles are supplanting the boisterous and vulgar holidays and festivals which are fresh in the memory of many of us. There is an invigorating and inspiring hope and promise in this. We are prone to repine that in public and political affairs so little regard is paid to moral considerations. We are apt to complain that the prizes of life are not distributed according to merit. But the bottom fact is that all things move forward by a steady march, and that step by step we approach the perfect goal. 'The world is gray with morning light.' Such exhibitions ennoble our ideas of man and the nobility of his work. He is more than a moving machine. Witness the splendid fabrics of his head and hand, the implements and improvements for saving time and toil. As we see what human skill can evolve from dull wood and iron, it would seem as if man had acquired the power which the gods were fabled to have given Midas, to turn the dead wood and black metal to gold at his touch. We stand amazed before the creative power of the human mind. The wonderful contrivances, and curious mechanisms, and subtle combinations, are the proofs of his immortality. The inventor cannot be a mere machine. The architect must outlive his work. Christopher Wren must survive St. Paul's cathedral. An ingenious and powerful piece of mechanism is in itself a proof of the worth and superiority of mind, of its alliance with God, and its immortal and imperishable destiny. The great poem may lift us to a higher plane; but who can stand upon a platform when the iron horse, whose sinews are made of steel, and whose provender is fire, 'black cavalry of commerce, with steam-flecked flanks,' as the silver-tongued orator of Arizona described it, when he was so glad to see it opening up that sterile land to civilization and the day—who, I say, can see him thundering down the grade without having excited in him emotions of wonder akin to worship?"

ABRAHAM LOISELLE, who was killed by a cave in the Silver Wave mine, Ellsworth, Nev., last week, was well and favorably known throughout Western Nye and on the Comstock, and his many friends regret his untimely fate.

The Denver Exposition—No. 7.

[Editorial Correspondence.]

Although now near its close, the mineral portion of the exposition is still receiving daily additions. It is much more of a show now than it was three weeks ago. Representations of agriculture are fast coming in, and make a most creditable appearance. The display of the three principal railroads, the Union Pacific, the Atchinson & Santa Fe and the Burlington, are perfect models, both in characteristic display and in the artistic manner in which they have been gotten up. They are each very extensive. From over the sea, Australia has just come in with the models of her famous gold nuggets—the largest in the world. They are shown in six well-filled cases as a side show. One, the largest, representing 620 lbs. of gold, the original being valued at $118,000, found at Hill End, New South Wales. North Carolina has also arrived with a knapsack full of gold nuggets from the Sam Christman placer mine of Montgomery county, N. C. This exhibit occupies a prominent position in Utah's front show-case. It attracts large crowds of admirers. This exhibit bears the following label: "The Ontario output, up to June 30, 1882, was $11,012,936." The claim of such a yield would seem to be a hold one. There are, in all, 67 nuggets, large and small, valued at $4,800. It is said that the Christian mine has yielded $150,000 during the last two years. It is a placer mine worked with only 36 inches of water.

CHAFFEE COUNTY

Chaffee county, Colarado, is located directly south of Lake county, from which it was set off in 1879. The great continental divide forms its western boundary, while its eastern reaches nearly to the base of Pike's peak. It is quite limited in extent of area. The early gold seekers made their appearance here soon after the discovery of gold in Gilpin and Clear Creek counties. All the region embraced in the counties named, and their immediate vicinity, was then known as the Pike's Peak diggings. The streams, here, as there, yielded considerable gold. Cash creek has continued to yield from that time to this.

Wonderful stories are told of a locality known as "Lost Canyon," which was said to have been prospected about 1861, and from which the miners were driven by the snows, and could never afterwards find it. Colorado creek was also rich. But little is known of the gold taken away from this region during the early years of mining here.

Silver was first discovered here in 1874; but little was done, however, toward developing the silver mines until 1879. The year previous, the Monarch mining camp was started, which soon developed into much value. That discovery, and the opening up of railroad communication to Leadville and Gunniston, each of which roads pass centrally, the one north and south, and the other east and west, through the county, have given an important impetus to mining in this county. At the present time, perhaps, no county in the State is better prepared for cheaper mining or smelting near the seat of production than is Chaffee.

Mines and Minerals.

Silver lodes are being found all along the eastern slope of the Rockies in this county. In the northern portion, toward Leadville, the formation is generally lime and porphyry, with occasionally, quartzite. The southern portion is mostly granitic or porphyritic. There are some seven or eight prominent towns in the county, and about the same number of prominent mining districts. The ores of the county generally present such a combination of lime, iron and lead that they furnish their own flux, and are therefore easily and cheaply smelted.

Chalk Creek District.

This is one of the most promising in the county. The veins are said to be mostly fissures, but of exceptional width, often widening out to 10 or 15 ft. or more. Of course, in such veins base metal and barren vein matter must predominate. Zinc and antimony, accompanied with iron and copper pyrites and galena, abound; but their quantity and the facility with which the ores are extracted brings up the value of the mines fully to as high figures, if not higher, than which prevail in veins yielding high-grade ore.

This district contains a large number of valuable mines, and makes a very fine and, in fact, an exceptional display, and also supplements its display by a very full description of the same and of the mines represented. The mines of this district extend quite up to the crest of the Rocky mountain divide. Porphyry occurs at intervals, with occasional contact veins between that and the granite; but as a general thing, the veins occupy fissures in the granite. They extend not only up to the summit, but are again found beyond on the western slope, in Gunnison county, possibly passing through the divide, but more probably entirely new and disconnected series of fissures. This occurrence of rich metalliferous

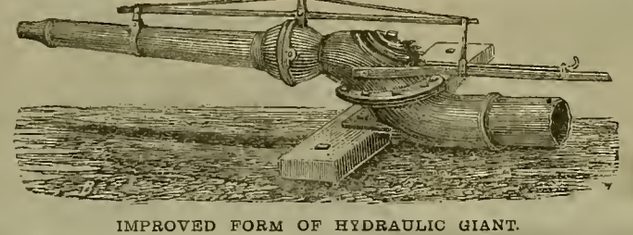
Veins at Such High Altitudes

And more often in porphyry or altered and greatly disturbed rock than in any other forms, one of the most noticeable features all through Colorado. In the San Juan district, which your correspondent has yet to describe, the veins are nearly all in porphyry, which is there present in three distinct overflows; the upper, the latest, and that occupying the highest elevation above the sea, carries by far the greatest number and the richest veins. The very country which in California would be passed over by the prospectors as barren and worthless is that which in Colorado the miner selects for his prospecting operations. The mines of Colorado are unlike those of California in their inclosing rocks as they are in their mineralogical character.

Colorado Mines Easily Worked.

There is also another peculiarity in almost every section of the mineral region. The mines generally occur in groups—an ordinary location of 300 ft. wide often coming from two to five distinct veins lying parallel. This fact enables several veins to be worked from one crosscut or tunnel, when the tunnel can be run at right angles to the veins. The facilities for tunneling are unequalled, and depth is easily acquired at small expense—the ore going down to the tunnels, with the water. Instead of being raised as it must be in a level country. Sinking and hoisting are most usually commenced at a great distance below the surface, thus achieving deeper workings at less cost than is usually incurred in other mining regions. Much discussion and speculation has arisen in regard to the question whether such veins which are usually narrow will not soon unite and form wide ones. A depth sufficient to decide this has not yet been reached anywhere in the State; but progress in that direction is rapidly being made, and some mammoth tunnel operations have also been commenced with that end in view, of which your correspondent will speak in future letters. Operations which rival in extent either the Sutro tunnel or that mammoth bore through the mountains of western Massachusetts, known as the Hoosac tunnel. If the deep and rugged canyons, and the precipitous mountain sides, are a hindrance to approach, and to the reception of machinery and supplies, that disadvantage is more than offset by the facilities which such a country affords to working the mines.

In the Hope and Granite district, the mines are largely gold bearing, that metal being found both in veins and placers. The Murphy mine, in Chalk Creek district, is largely gold bearing. That mine is being thoroughly opened, and an immense body of ore is reported as now in sight, and although but little has yet been worked, very large mill veins have been reported as high as $131 to the ton. About $250,000 have been taken out of this mine. The Chrysolite near St. Elmo, is very similar in character to the Murphy. The Monarch, of



IMPROVED FORM OF HYDRAULIC GIANT.

Monarch mountain, is also being rapidly and systematically developed.

The Milling Establishments.

The Foster ore and metal works, at Alpine, are owned by Boston capitalists, with Mr. N. W. Storer as manager. The rock is reduced at these works by two Blake crushers and Cornish rolls. They have two reverberatory roasting furnaces of the latest and most approved construction. In addition to a fine 25-foot headwater power, they have just put in a 35-horse power engine to drive mill and blast.

The Pombina Silver Mining and Milling company, a Philadelphia organization, under the superintendency of P. A. Snell, owns four mines, which are fast being developed with most promising success. They have a mill and concentrating machinery, with a short side track to the Denver and South Park railroad, over which their ores are shipped, after concentration, for furnace treatment. A Blake crusher and Cornish roller is used for crushing. For concentration, the ore passes from the crusher through a graduated series of screens, and thence to a set of Rogers swing gate jigs. In addition to that, a new jig has recently been put in, the invention of Mr. Robert Parry, from which, superior results are expected. We have not, as yet, heard any reports from this machine. The slimes are carried to and separated on a Rittinger table. So numerous have been the applications of late from neighboring mines for the reduction of their ores, that an importon addition to these works will soon be made.

The Iron City smelter, half a mile from St. Elmo, has a first class 40-ton water-jacket furnace, and a Blake crusher—Mr. J. D. McClusky is in charge. This company owns five mines, and machinery for roasting has been ordered at Philadelphia, all of which, will soon be, if, indeed, it is not already in operation at this writing.

The Monarch Co., of Monarch mountain, owns not only the mine there, but a so three others and a smelting furnace, which is kept in constant operation upon their own ores.

Chaffee County's Exhibit.

Chaffee county may well be proud of her exhibit as well as of her mines. Nearly every district is represented; ores from about 70 producing mines being shown, proving, most unmistakably, that she possesses great storehouses of the precious metals, and that capital and well directed effort, is all that is needed to bring to the light of day their hidden treasures.

In addition to the precious metals, this county also shows iron, lime, building stone, fine clay and charcoal, all of which combine to create the facilities for carrying on mining as a legitimate and profitable enterprise. The county was well represented by Messrs. E. R. Emerson and S. E. Lund, to whom too much praise cannot be accorded for the intelligent and faithful manner in which they have discharged their duties as commissioners.

FREMONT COUNTY.

This county is situated southeast, and adjoining Chaffee, and in the geographical center of the State. It is chiefly agricultural, but also possesses some very promising mines. Until quite recently, the mineral resources of the county have been quite overlooked by prospectors in their haste to reach the mountains, and probable millions beyond. Indeed, nothing in the way of mining has been done here, until within the past year. But during that time, not less than 7,000 men have been engaged in active mining or prospecting operations within the county. The result has been the discovery of a great number of promising mines, one of which is now shipping an average of a car load of ore a day to the smelter, with almost a certainty that the number of producing mines will be increased to five or six during the coming fall and winter. Enough has already been developed to warrant the assumption that the production of the precious metals in Fremont county will, ere long, form a potent factor in the estimates of Colorado's gold and silver production. Gold, silver, copper, zinc, cobalt, nickel and iron have already been found there. About 600 locations have been made in one locality.

The mineral discoveries are scattered over quite a large extent of territory in the western and southern or mountain portions of the country.

A discovery which is considered very important, has just been reported from the neighborhood of Canyon City, and in the Green Jacket mine. The ore, when struck, has been carefully sampled and assayed by a reliable mining expert, who reports 334 ounces of silver to the ton, with large ore body. A milling lot has been sent to Pueblo for furnace treatment, and another lot to the furnace at Canyon City.

Coal Oil and Building Stone.

Aside from the precious metals and her agricultural productions, Freemont county is undoubtedly rich in coal, coal oil and building stone. The present output of coal in this county is about 2,000 tons per day.

She makes a very fine and interesting exhibit, in a specially constructed pagoda, which is ornamented by two columns of Corinthian and Ionic architecture, wrought from the famous Branford sandstone, which abounds in this county. Some elegant specimens of variegated marble and granite, which take a beautiful polish are also shown. They are found in the jurassic beds, which occur four miles from Canyon city.

W. B. Ewer.

The Colorado Iron Works at the Denver Exhibition.

The exhibit of the Colorado iron works is very extensive. It consists of a 12x21 engine, which is employed in running the shafting on the east side of the machinery hall. It is nicely finished with the Hartford style of bed, and looks very massive. This is the smoothest-running engine in the building. This company also shows a 9x12 horizontal engine, plain slide valve; also a 9x12 upright-geared hoist; also a 9x12 horizontal friction hoist; also 27-inch Cornish roll, with chilled-iron shells, made very substantial and strong; also a Dodge jaw-crusher, ore cars, ore buckets, etc.; also working barrel and clack chambers of a 10 inch Cornish pump; also specimens of forgings. These forgings are good. The general design and all the workmanship of the machinery is good, but the designs will doubtless be changed as depth in the mines is obtained, necessitating heavier machinery. This exhibit is in the special charge of Mr. Joseph Marshall.

The Manufacturing Plant,

Shops and office of this company are located at the corner of Thirty-third and Wynkoop streets, and form one of the largest manufacturing institutions of Denver. Having become interested in the exhibit at their exposition building, your correspondent took occasion to visit the works at the above locality. This concern makes a specialty of manufacturing mining machinery. The projectors of the enterprise early foresaw the necessity of works of this kind in a section of the county where mining has become the chief industry. And, notwithstanding the destruction of their works by fire a year or more ago, they are now better than ever prepared to supply all the wants of the numerous mining camps which are springing up in every section of the State of Colorado and the neighboring States and Territories.

The works of the company are very extensive, and all the machinery, tools and other appliances are of the most approved design, and they employ none but the most experienced workmen. Their facilities for doing work are not excelled by any, even by the largest and best equipped establishments either East or West. The gentlemen in charge of the works, during a term of 22 years' experience, and an intimate personal knowledge of the mines and their needs, know just what is needed and how to prepare it. Residing and carrying on business in the immediate vicinity of the mines, they are much better able to know and meet the wants of the mines than manufacturers at the East who are removed from observation.

The Catalogue of Machinery

Which they manufacture is quite varied and extensive, and not altogether confined to that in the line of mining. In addition to everything connected with milling, hoisting, pumping, tunneling, etc., they are also prepared to furnish all kinds of iron-building work. Their catalogue, which is before me as I write, contains numerous illustrations of plain and ornamental columns, pilasters, etc., many of which have been turned out at this establishment for various buildings, public and private, in the city of Denver. The company is prepared to furnish mills or machinery at their works, or will set them up at the mines anywhere in the Rocky mountains.

The Casting of Car-Wheels

Is one of the specialties of this establishment, their full capacity in this work being 130 wheels per day. All the works are laid out with special reference to quick and economical working. They have a tramway running through the molding-room. Molds difficult to handle are often built up on cars, dried and run on tramway direct to furnaces for casting. They have two furnaces with a capacity of 10 and 20 tons respectively. The heaviest steam hammer has 3,500 lbs. weight of ram, with a 14½ inch cylinder and 40 inch stroke. The machine-shop as now used is 130 ft. by 50, with roof and other fixtures designed for doubling its capacity, and over head tramways run the entire length of the room, with crossing facilities to reach every lathe or other machine in the shop. The gear cutter, it is claimed, is the largest west of St. Louis, and capable of cutting gear wheels nine feet in diameter. The largest planer is capable of taking in anything 20 ft. long, 44 inches wide and five feet high.

All the main buildings are constructed of brick and iron, to guard against any future contingency of fire. The roof of the main building is both a novelty and a model of design. It is constructed entirely of iron, and of such massiveness, and so designed as to support all the shafting, pulleys, overhead tramways, etc. The extensive Grant Smelting works, which are in course of construction near by, have contracted with this company to build their roof after the same design, at a cost of $19,000. They are also turning out eight water jacket furnaces for those works.

One of the most notable improvements in this establishment is their mode of breaking and handling pig-iron, in charging their furnaces. The iron is thrown into a machine or breaker, which breaks each pig into four pieces, which drop into a car below, from which point, together with such other scrap iron as may be introduced, it is conveyed by steam power up an inclined railway direct to the mouth of the furnace, when it is almost automatically allowed to drop its load directly into the stack. It is claimed that with this machine three men are all that are required to handle the iron and coal, and attend to a 40 ton cupola, while with the ordinary mode of breaking the pigs and handling them and the coal, the labor of twelve men is required. This breaker is the invention of Mr. J. W. Nesmith, the superintendent of the works. These extensive works belong to four owners—Mr. Nelson Hallock, President; Mr. C. W. Fisher, Cashier; Mr. J. W. Nesmith, Superintendent; and Mr. W. R. Haven, of Leadville. Their postoffice box is 1921, Denver, Colorado.

Improved Hydraulic Giant.

The accompanying engraving illustrates a hydraulic nozzle which, in its construction, has several improvements over the old form. The improvements consist in having abolished the use of that portion of the machine designated as the deflector, by which the inconvenience and danger attending the necessity of standing alongside of the head of the nozzle when in operation, in order to direct the stream, is obviated.

The heavy, cumbersome, weighing part of the old form, is also abolished. This arrangement was originally intended to hold the nozzle in position when in operation, and the effect was that when the water was shut off the end of the nozzle dropped, whilst the new form is held in position by a ratchet and pawl, and the entire machine is now operated by a single lever connected along the upper length of the nozzle and projecting behind it.

By the use of this lever the operator or pipeman is enabled to easily and completely control the angle of direction and to readily observe from his position its effect.

This is the "Fisher" machine, made by Joshua Hendy, of this city. It is made under the reissue patent granted to F. H. Fisher, on September 2, 1879, and which has been decided as valid by the U. S. Circuit Court. The hook shown or the lever, is the end of the latch which holds the Giant in any desired position.

CHICAGO **FRASER & CHALMERS** ILLINOIS

MANUFACTURERS OF IMPROVED AND APPROVED FORMS OF

MILL AND MINE MACHINERY.

Having made extensive additions to our Shops and Machinery, we have now the LARGEST and BEST APPOINTED SHOPS in the West. We are prepared to build from the Latest and Most Approved Patterns,

QUARTZ MILLS

For working gold and silver ores by wet or dry crushing. The Stetefeldt, Howell's Improved White, Brunton's & Bruckner Furnaces, for working base ores. Rotary Dryers, Stetefeldt Improved Dry Kiln Furnaces.

SMELTING FURNACES,

Water Jackets, either Wrought or cast iron, made in sections or one piece, either round, oblong, oval or square. Our patterns most extensive in use. SPECIAL FURNACES FOR COPPER SMELTING. Slag Pots and Cars, improved form. Bullion and Copper Moulds and Ladles, Litharge Cars and Pots, Cupel Furnaces and Cars.

HOISTING ENGINES

Large or Small for flat or round rope. Double Cylinder Engines, from 6x10 to 18x60. This latter size furnished J. B. Haggin for Giant and Old Abe Co., Black Hills also Corliss Pumping Engines, 26x60, for Hoisting and Pumping Works, for 2,000 feet deep. **Baby Hoists for Prospecting, 4 H. P. to 6 H. P.**

Wire Rope, Safety Cages and any Size and Forms of Cars. **McCaskell's Patent Car Wheels and Axles—Best in Use.**

Principal Office and Works, Fulton and Union Sts., Chicago, Illinois. **New York Office, Walter McDermott, Manager, Room 32, No. 2 Wall St.**

Frue Ore Concentrator, or Vanner Mills.

Coarse Concentrating Works, Improved Jigs, Crushing Rollers, Sizers, Trommels, Rittenger Tables, and all other adjuncts for the proper working of Gold, Silver and Copper Ores, complete in every detail.

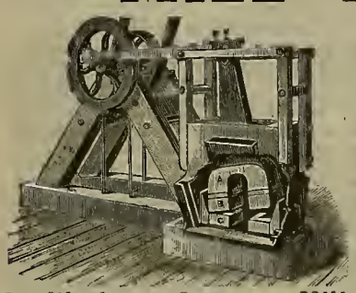
HALLIDIE IMPROVED ORE TRAMWAYS. We refer to Gen. Custer mine, Idaho, 5,000 feet long; Columbus Mine, Col., 4,750 feet long; Mary Murphy mine, Col., 5,000 feet long, all in constant operation.

LEACHING MILLS,

Improved Corliss and Plain Slide Valve Meyer's Cut-off Engines.

CORLISS ENGINES from 12x36 Cylinders to 30x60. PLAIN SLIDE VALVES from 6x10 to 36x36. BOILERS of every form, made of Pine Iron Works C. H. No. 1 Flange Iron, or Otis Steel. Workmanship the most careful. All Rivets Hand Driven.

MILL AND MINING MACHINERY.



Oscillating Stamp Mill.

Is has no Stems, Cams, or Tappets, and adjusts itself to the wear of the Shoes and Dies.

For simplicity, economy, durability and effective working, it exceeds anything ever presented to the public, and will do the work of five stamps with one-fourth the power. Awarded First Premium and Medal at Mechanics' Fair, S. F., 1880.

Manufactured by

F. A. HUNTINGTON, 220 Fremont St., S. F., Cal. | FRASER & CHALMERS, 145 Fulton St., Chicago, Ill.

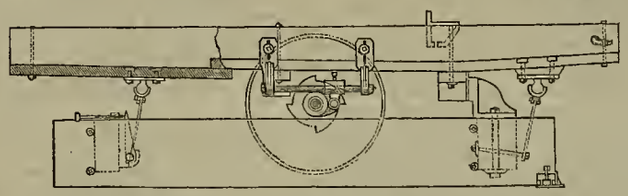
Improved Patent Grinding and Amalgamating Pans, Concentrators and Gold Amalgamators; also, Steam Engines and Mining Machinery of all kinds. Send for circulars.

F. A. HUNTINGTON,

220 Fremont Street, San Francisco, Cal.

F. A. HUNTINGTON,

No. 220 Fremont Street, - - San Francisco, Cal.

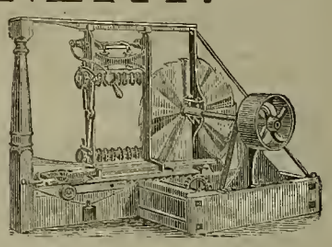


PATTEN'S CONCENTRATOR.

This machine requires less power, less care or attention, and is less liable to get out of repair than any concentrator now in use. All of which any practical miner will comprehend when seeing it in operation.

The wear and tear is nominal, and the construction so simple that any miner can put it up and run it; and the low price brings it within the reach of all mill men, as it will save enough to pay for itself in any mill in very short time. One machine will concentrate the tailings from a five-stamp battery.

☞ Send for Circulars. ☜



SHINGLE MACHINE.

For simplicity, durability and rapidity of action, these Machines have no equal, cutting from 3,000 to 4,000 per hour. They are now used by all the principal Millmen on the Pacific Coast.

MINING MACHINERY A SPECIALTY.

Our manufactures of mining machinery embrace every kind of machine and appliance for the mining and reduction of ores.

We have had an experience of more than twenty years in the manufacture and practical operation of mining machinery in Colorado and the neighboring States and Territories.

Our facilities are superior to those of any manufactory in the West, our works having been recently rebuilt, greatly enlarged and completely equipped.

We invite the investigation of mine owners and mill men seeking machinery. We can furnish, on board, at our works, or set up at the mines anywhere in the Rocky Mountain region, on short notice, the following machinery: Cornish Pumps, Steam Pumps, Stamp Mills for Wet or Dry crushing, Pans, Settlers, Agitators, Retorts, Bullion and Ingot Moulds, Reverberatory Furnaces, Bruckner Cylinders, Revolving Roasting Furnaces and Dryers, Melting Furnaces, Concentrating Machinery, Rolls, Crushers, Conveyors and Elevators, Ore Samplers and Grinders, Hoisting Engines, Water Jacket Furnaces, Slag Pots and Cars, Lead Pots and Ladles, Blast Pipes and Water Tuyeres, Blowers, Cupellation Furnaces, Market Kettles, Wire Rope, Cages, Buckets, Skips, Ore Cars, etc. Estimates furnished and prices quoted on application. Send for illustrated catalogue.

Awarded the First Premium at every Fair of the Mechanics' Institute for the last 12 Years.

STEEL CASTINGS

FROM 1-4 TO 10,000 lbs. WEIGHT.

True to pattern, sound and solid, of unequaled strength, toughness and durability.

An invaluable substitute for forgings or cast-iron requiring three-fold strength.

Gearing of all kinds, Shoes, Dies, Hammerheads, Crossheads for Locomotives, etc.

15,000 Crank Shafts and 10,000 Gear Wheels of this Steel now running prove its superiority over other Steel Castings.

CRANK SHAFTS, SHOES, DIES and GEARING specialties.

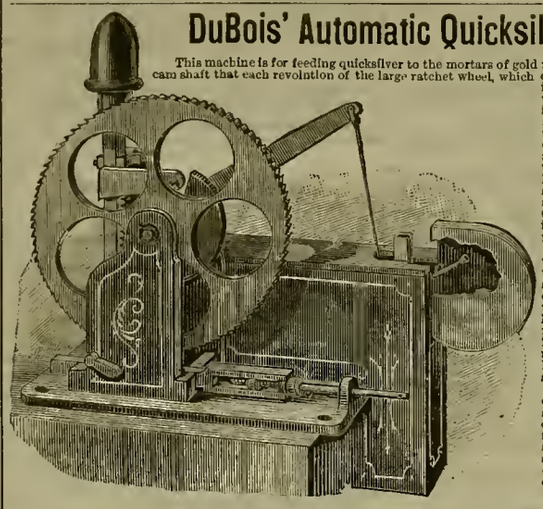
DuBois' Automatic Quicksilver Feeder.


This machine is for feeding quicksilver to the mortars of gold mills. It is so connected to the cam shaft that each revolution of the large ratchet wheel, which can be regulated to revolve once in one, two, three or four minutes, as desired, dips a small cup into a reservoir of quicksilver, and by a trip of the cam, empties the contents into a pipe leading down to the mortar, supplying an exact quantity at regular intervals, superseding the ordinary hand feeding, which is of necessity subject to great irregularity, and liable to neglect. It renders the amalgamation of all the gold in the pulp equally certain and perfect.
The mechanism to produce this depression and elevation of the cup, is driven by the cam shaft, similarly to the self-feeders, over which so much ingenuity has been expended to regulate the delivery of ore to the mortar. As it is to be desired to have the ore go in constantly and regularly, so it is equally desirable to have the mercury fed constantly and regularly.
A chief point of excellence of this machine is, that it allows the quantity of mercury which would be otherwise fed in mass, in one hour, to be subdivided into a number of small portions, and fed almost continuously; i. e., from every one to four minutes.
Price, complete, $75.
For Sale by **WHITNEY & MARSHALL,** Sole Agents
22 & 24 Fremont St., San Francisco.
Dealers in Iron, Steel, Hardware and Mining Supplies, Wrought Iron Pipe and Fittings, Pump Columns, Wire Rope, etc. A large stock of Boiler, Plate and Sheet Iron of every description.

Mechanics' Fair Premiums.

The following awards have been announced by the Board of Managers:

Machinery.

W. H. Ohmen—Vertical engine and boiler combined, in motion, silver medal.
W. H. Ohmen—Vertical engine in motion, silver medal.
W. H. Ohmen—Hoisting engine and boiler combined, bronze medal.
Hawley Brothers—Rice's straw-burning engine, silver medal.
P. H. Jackson—Device for more complete combustion of coal, silver medal.
W. T. Garratt—Display of steam-engine governors, flanged globe valves and safety valves, silver medal.
Wood & Kingwell—Tallow lubricator for engine cylinders, diploma.
Llewellyn Steam Condenser Manufacturing Company—Llewellyn heater and condenser, diploma.
Central Gaslight Company—Otto gas engine, bronze medal.
Central Gaslight Company—Calorio engine, bronze medal.
Occidental Foundry (Steiger & Kerr)—Orate bar, California make, diploma.

Machinists' Tools.

Pacific Saw Manufacturing Company—Display of edged tools, silver medal.
C. F. Marwedel—Best display machinists' tools, diploms.
Pacific Stove and Iron Works—Combined vise and anvil, diploma.
J. A. Studebaker—Tailor's square combined with sweeps, diploma.
W. T. Garratt—Anderson's improved furnace and forge fan-blower, bronze medal.
Abner Doble—Best general display blacksmiths' and stonecutters' tools, silver medal.
W. A. Williams—Soldering machine, silver medal.
J. B. Jardine—Power shears, punching machines and display of boiler tubes, bronze medal.
John Wright—Improved pick, bronze medal.
San Francisco Tool Company—Shaper and planer combined, bronze medal.
San Francisco Tool Company—Gear cutter and milling machine, bronze medal.
San Francisco Tool Company—Drilling and boring machine, bronze medal.
San Francisco Tool Company—Engine lathes, bronze medal.
San Francisco Tool Company—Best general display of bone-made machinists' tools, gold medal.
Pacific Saw Manufacturing Company—Best general display of cutters for wood-working machinery, gold medal.
N. W. Spaulding—Best circular saw with inserted teeth, silver medal.

Menufactured Minerals.

Selby Smelting and Lead Company—Best general display of lead and its manufactures, gold medal.
Abner Doble—Cast-steel bars, diploma.
W. T. Garratt—Tin, copper and antimony in pigs, bronze castings and statuary, diploma.
Occidental Foundry (Steiger & Kerr)—Iron castings, car wheels, etc., silver medal.
Betts Spring Company—Locomotive, car and carriage springs, silver medal.
California Wire Works—Iron, steel, copper, tinned and galvanized wire, gold medal.
California Iron and Steel Company—Pig iron, gold medal.
H. N. Cook—Fire buckets and hose pipe, diploma.
Griswold Bros.—Fire escape, silver medal.
W. T. Garratt—Best bydrant, diploma.
Will & Fink—Best general display of cutlery, gold medal.

Agricultural Machinery.

D. M. Osborne & Co.—Agricultural machinery, gold medal; self-binding grain harvester in operation, silver medal; reaper and mower with self-rake, bronze medal.
M. C. Hawley & Co.—Buckeye gang plow, silver medal; sulky rake and hay and straw cutter, bronze medals; sulky plow and lawn mower, diploma.
Jackson & Truman—Harrow, bronze medal; derrick fork-hoist, silver medal.
Hawley Bros. Hardware Company—Almond huller, bronze medal; Challenge feed mill, diploma.
Judson Manufacturing Company—Victor mower, silver medal.
George Bull & Co.—Riding cultivator, diploma; walking cultivator, diploma; sidehill plow, diploma; plow for general uses, diploma.
D. N. Hawley—Reaper, bronze medal; creamer, churner and butter-worker, diploma.
R. G. Bush—"California Clipper" grain cleaner, bronze medal.
T. A. Mudge—"Wheeler" fruit cleaner, bronze medal.
Batchelor & Wylie—Harrow and cultivator, diploma.
W. F. West—Grain chopper and grist mill, bronze medal.
A. La Jeunesse—Model of harrow, diploma.
Hawley Bros. Hardware Company—Keystone corn sheller, bronze medal; Champion fan mill, bronze medal; Buckeye cider mill, diploma.
J. S. Woolsey—Cheese vat and lawn sprinkler, diploma.
John Wiltz—Pruning shears, diploma.

Mining Machinery.

M. B. Dodge—Ore breaker in operation, silver medal.
W. T. Garratt—Rock drill, silver medal; air compressor, silver medal.
H. R. Redstone—Quartz mill, silver medal.
J. Hendy—Ore feeder, silver medal.
F. A. Huntington—Amalgamating and crushing pan, silver medal.
W. I. Tustin—Dry crushing mill, silver medal.
Triumph Concentrator Company—Concentrator, silver medal.
W. B. Farwell—Dry concentrator, silver medal.

Fruits, Flowers, Etc.

E. Meyer—Foliage, plants and ferns, silver medal.
Woodward's Gardens—Second best display, bronze medal.
John Pouyal—Third best, diploma.
J. T. Murphy—Cut flowers, silver medal.
Thomas Saywell—Second best, bronze medal; dahlias, bronze medal.
Sol. Runyon—Fruit, $75 cash and silver medal.
Mrs. McLellan—Prolific pear graft, diploma.
G. W. Hinckley—Mountain peaches, diploma.
Munson & Orevis—Tuscan wheat, diploma.
Evelyn & Nash—Fruit, diploma.
J. H. Thomas—Watermelon, diploma.
A. Crawford—Gravenstein apples, diploma.
El Dorado Fruit Company—Mountain peaches, diploma.
W. J. Hunt—Apples and peaches, diploma.
Francis De Long—Cider and cider vinegar, bronze medal.
B. F. Wellington—Seeds, mushroom spawn, etc., diploma.

Carriages, Etc.

David Kerr—Best truck, silver medal.
David Kerr—Best hose cart, silver medal.
David Kerr—Four-spring wagon with top, silver medal.
Jerry Lowney & Son—Best coal cart, silver medal.
O. F. Wiley & Co.—Best general display carriages and buggies, Eastern manufacture, silver medal.
Carvill Manufacturing Company—Best open buggy, bronze medal.
M. Kitzmuller—Best top buggy, silver medal.
M. J. McCue—Best general display carriages, California make, gold medal.
David N. Hewley—Two-wheeled phaeton, diploma.
E. Whitmore—Two-wheeled, side-bar phaeton, diploma.
J. A. Bilz—Jump cart, diploma.
W. H. Landers—Man catcher, diploma.
David Kerr—Best milk wagon, silver medal.
Main & Winchester—Best general display of harness and saddlery, gold medal.
H. N. Cook—Leather belting, silver medal.

Miscellaneous.

Franco-California Packing Company—For preserved fruit and vegetables, gold medal.
P. Wulff—Mustard, pickles and sauce, bronze medal.
J. T. Cutting & Co.—Crushed Indian meal, diploms.
Francis De Long—Boiled and sweet cidere and cider vinegars, bronze medal.
George Haas—Confectionery, silver medal; fine and fancy candies, diploma.
B. F. Wellington—Assortment of seeds, fresh mushroom spawn and illustrated collection of vegetables, diploma.
W. W. Montague & Co.—Marbleized iron mantels and grates, silver medal.
Gladding, McBean & Co.—Fire-brick, diploma.
John B. Owens—Best assortment of terra-cotta ware, silver medal; best yellow ware, Pacific coast make, bronze medal.
Gladding, McBean & Co.—Best sewer and drain pipe, Pacific coast make, silver medal; ornamental chimney-tops, silver medal.
G. O. Burnett—Best general display chemical and pharmaceutical preparations, silver medal.
Standard Soap Company—Best display California-made candles, silver medal.
Janies M. Souther & Co.—Best display of extracts and essences, California production, silver medal.
Col. Warren Leeds—Historical relics and curios, silver medal.
William Woodward—Natural history specimens, silver medal.
Seal Rock Tobacco Company—Tobacco, silver medal.
Pioneer Varnish Manufacturing Company (Heuter Bros.)—Varnishes, silver medal.
Whittier, Fuller & Co.—Paints and oils, California manufacture, gold medal; mixed paints, ground in oil and in colors, silver medal; Pacific rubber paints, silver medal; California-made glue, silver medal.
T. J. Bass—Artists' materials, silver medal.
Pacific Ink Factory—Inks and mucilages, silver medal.
George C. Thompson—Soda-water apparatus, silver medal.
Foy Bros.—Stove polish, lubricants, etc., bronze medal.
Columbia Soap Company—Best general exhibit of soaps of California manufacture, gold medal; best toilet soaps, silver medals.

Adolph Goebring—Artificial flowers, silver medal.
A. Rogers—White ostrich feathers, bronze medal.
A. J. Baluy—Ostrich feathers (colored), diploma.
John F. Snow—Refinished crape, diploma.
Mrs. M. H. Ober & Co.—Dress reform goods, diploma.
Columbia Soap Company—Best exhibit of soaps, California make, gold medal; best toilet soaps, silver medal.
Boericke & Shreck—Homeopathic remedies, etc., diploma.
F. C. Kiel—Perfumery and extracts, silver medal.
James N. Souther—Extracts and essences, California make, silver medal.
American Salt Company—Manufactured and rock salt, bronze medal.
William Woodward—Natural history specimens, silver medal.
Whittier, Fuller & Co.—Various assortments of paints, oils, glue, etc., one gold and three silver medals.
Henry Lake & Co.—California-made shoeblacking, bronze medal.
T. J. Base—Artists' materials, silver medal.
Davis & Cooper—Oil blacking, diploma.
Pacific Ink Factory—Inks, mucilage, etc, silver medal.
Pacific Fertilizing Company—Best exhibit of fertilizers, diploma.
George C. Thompson—Soda-water generating apparatus, California make, bronze medal; soda water draft apparatus, silver medal.
Foye Bros. (Dixon Crucible Company)—Stove polish, axle grease and lubricants, bronze medal.
J. J. L. Merrill—Asbestos, silver medal.
W. H. Reyburn & Brothers—Compressed shavings, diploma.
Mrs. J. Luger—Wax and skeleton flowers, diploma.
H. Reynolds—Skeleton leaf pictures, diploma.
J. G. Grundel—Ivory goods and canes, bronze medal.
Mlle. Delabaere—Wax models, statuettes, etc., diploma
Henry Cousins—Renaissance portrait frame, bronze medal.

Agents Now Wanted.

Extra inducements will be offered for a few active canvassers, who will give their whole attention (for a while at least) to our business. Apply soon, or address this office, giving address, age, experience and reference.

DEWEY & CO., Publishers,

No. 252 Market St., S. F.

Our Agents.

Our Friends can do much in aid of our paper and the cause of practical knowledge and science, by assisting Agents in their labors of canvassing, by lending their influence and encouraging favors. We intend to send none but worthy men.

O. W. McGrew—Santa Clara county.
M. P. Owen—Santa Cruz county.
J. W. A. Wright—Merced, Tulare and Kern counties.
Jared C. Hoag—California.
H. H. McDonald—Solano and Yolo counties.
L. L. Woodmansee—Napa county.
B. W. Crowell—Santa Barbara and Ventura counties.
Wm. S. Taylor—State of Nevada.
L. Walker—Butte, Sierra, Plumas and Lassen counties.

Old Papers Wanted.

Twenty cents each will be paid for a limited number of copies of any of the following Nos. of the Mining and Scientific Press, if received soon at this office: No. 1, of Vol. 13, 1866; No. 5, Vol. 18, 1869; Nos. 1 and 26, of Vol. 20, 1870; No. 1, of Vol. 22, 1871. Also, 10 cents per copy for Nos. 2, 3, 4, 7, 10, 11, 12, 13 and 15, of Vol. 30, 1875. If any one who has files of back volumes of the Press, which they may like to dispose of at a moderate rate, will send us a memorandum of the same and the price, we may be able, sooner or later, to assist in their disposal.

For Sale.

A twenty-stamp steam mill, complete and almost new. Also, air compressors, drills and mining machinery. Anyone having a gold or silver mine warranting the investment, may buy the material on time by making monthly or quarterly payments. Address, CHARLES E. SHERMAN, Havilah, Kern County, Cal.

Attend to This.

Our subscribers will find the date they have paid to printed on the label of their paper. If it is not correct or if the paper should ever come beyond the time desired, be sure to notify the publishers by letter or postal card. If we are not notified within a reasonable time we cannot be responsible for the errors or omission of agents

How to Stop this Paper.—It is not a difficult task to stop the paper. Notify the publishers by letter. If it comes beyond the time desired you can depend upon it we do not know that the subscriber wants it stopped. So be sure and send us notice by *letter*.

Important additions are being continually made in Woodward's Gardens. The grotto walled with aquaria is constantly receiving accessions of new fish and other marine life. The number of sea lions is increased and there is a better chance to study their actions. The pavilion has new varieties of performances. The floral department is replete and the wild animals in good vigor. A day at Woodward's Gardens is a day well spent.

Sample Copies.—Occasionally we send copies of this paper to persons who we believe would be benefited by subscribing for it, or willing to assist us in extending its circulation. We call the attention of such to our prospectus, terms of subscription, etc., and request that they circulate the copy sent.

Patents and Inventions.

List of U. S. Patents for Pacific Coast Inventors.

From the official list of U. S. Patents in Dewey & Co.'s Scientific Press Patent Agency, 252, Market St., S. F.

For the Week Ending September 19, 1882.

264,507.—Log Chute—Wm. H. Barnum, Reno, Nev.
264,508.—Grain Cleaning Apparatus—Daniel Best, Albany, Oregon.
264,509.—Grain Separator and Cleaner—Daniel Best, Albany, Oregon.
264,537.—Wheelbarrow—John Devey, Alpine City, Utah Ter.
264,569.—Machine for Making Wire Rope—A. S. Halidie, S. F.
264,521.—Forming Button Holes—Loo Chew Fan, S. F.
264,538.—Cuff Button—David Lubin, Sacramento, Cal.
264,539.—Bottle—David Lubin, Sacramento, Cal.
264,546.—Harrow—D. C. Matteson, Stockton, Cal.
264,549.—Can Opener—W. A. McFarlane, Ivanpah, Cal.
264,468.—Bed Spring—D. F. Mitchell, Ferndale, Cal.
264,561.—Door Plate, Letter Box, etc.—Chas. H. Parmenter, Oakland, Cal.
264,569.—Brass Shoe—A. W. Sanborn, S. F.
264,581.—Harness Buckle—J. T. Stoll, Sacramento, Cal.
264,586.—Soda Water Apparatus—F. S. Waldo, Alameda, Cal.
264,590.—Infusing Attachment for Tea and Coffee Pots—James L. Williams, Portland, Oregon.

Note.—Copies of U. S. and Foreign Patents furnished by Dewey & Co. in the shortest time possible (by telegraph or otherwise) at the lowest rates. All patent business for Pacific coast Inventors transacted with perfect security and in the shortest possible time.

Notices of Recent Patents.

Among the patents recently obtained through Dewey & Co.'s Scientific Press American and Foreign Patent Agency, the following are worthy of special mention:

Brake-shoe.—A. W. Sanborn, S. F. No. 264,569. Dated Sept. 19, 1881. This invention relates to brake-blocks loosely pivoted on the brake-bar and forced into position by springs. The bar or shaft is journaled under the body, and its arms extend downwardly on each side, and carry the brake-blocks in a vertical position and in line with the rear wheel or wheels. The blocks are arranged usually to impinge against the wheel at about the same hight as its center or hub, and at this point they meet the tire of the wheels squarely and impinge over their entire face. The blocks are rigidly secured upon the rod, and are brought against the wheel by the rocking movement of said rod. Now it is obvious that when the vehicle is loaded, and the body is borne down, the brake-blocks are lowered; but because of their being rigidly seonred upon the rod, they do not vary their inclination, but remain vertical and in a position to fit squarely against the wheel only at one point. Therefore they cannot fit the wheel at a point lower down. When thrown back against the wheel the top of the block alone impinges, and the leather, or other shoe upon its face, becomes so much worn that new ones have to be continually supplied. The reverse of this is true when no weight at all is put upon the body. In that case the blocks are elevated, and when forced back against the wheel the lower portions impinge. The object of the invention is to remedy this difficulty, and this is done by loosely fitting the block upon the rod, and so affecting it by springs that in whatever position it may be, and no matter whether the top or bottom impinges first, it may yield sufficiently to square itself against the wheel and wholly fit its face against it.

Combined Door Plate, Letter-box and Bell-puller.—Charles H. Parmenter, Oakland, Cal. No. 264,561. Dated Sept. 19, 1882. This invention relates to a door-plate, letter-box and bell-pull, and it consists in a box placed upon the inside of the door, to which access from outside is had by pulling out a drawer or chute fitting through the door, the front of which is adapted to receive a name, and which by its movement rings a gong, by means of suitable intermediate mechanism.

Grain-cleaning Apparatus.—Daniel Best, Albany, Oregon. No. 264,508. September 19, 1882. This invention relates to an improvement in grain-cleaning machines, and it consists in combining with a riddle and a blast-fan an auxiliary suction-fan in the top of the case, passages to such fan from the space above the riddle, and a hinge door for closing said chamber.

Method of Forming Button Holes. — Loo Chew Fan, San Francisco. No. 264,521. September 19, 1882. This invention relates to an improved method of forming button-holes in button shoes, and for similar purposes, and it consists in an improved continuous finish extending along the inner ends throughout the entire line of button-holes upon the inside.

Grain Separator and Cleaner. — Daniel Best, Albany, Oregon. No. 264,509. September 19, 1882. This invention relates to certain improvements in grain separating or cleaning apparatus, and it consists in certain specific details of construction, forming a novel and efficient grain separator.

Harrow.—Don Carlos Matteson, Stockton, Cal. No. 264,546. September 19, 1882. This invention relates to certain improvements in harrows; and it consists in an improved formation of the beams or bars of the harrows and in the manner of fixing and holding the teeth in place,

IMPORTANT SEMI-TROPIC COLONY ENTERPRISE.

The Fairest and Best of Colonies.

THE REDLANDS,

In San Bernardino County, California.

Superior Soil, Climate and Irrigating Improvemente.

The following information concerning one of the best-reputed and promising colony enterprises in southern California, is from the Riverside *Press*, of San Bernardino county, April 1, 1882:

A Model Settlement.

No place in California has sprung into public notice so rapidly and gained so deserved a reputation in so short a time as has the new tract of Redlands.

This tract is located between Old San Bernardino and Crafton on the south side of Mill Creek ditch and comprises 2,500 acres of as choice fruit lands as can be found in the State. The land is of a reddish clayey loam, not clayey enough to work hard, having sufficient admixture of sand to hold moisture and give the best results when planted to orchard or vineyard. The red lands of the State are everywhere celebrated as being superior for tree and vine.

The tract slopes to the northwest and commands one of the grandest views to be found in the State. To the north and northwest lies stretched out, several hundred feet below, the San Bernardino valley, with the towns of San Bernardino and Colton plainly in view, while, looking to the westward at night, the headlights of the Eastern-bound trains can be distinctly seen for 40 miles. Beyond the San Bernardino valley to the northwest, and stretching around to the northeast, the chain of mountains tower 9,000 ft. above the sea level, culminating in Mount San Bernardino, 11,000 ft. high, and Grayback, 11,550 ft. high, both of which stand up boldly from the Redlands point of view, and whose tops are covered with snow more than half of each year. Around to the left of the picture are the Cucamonga peaks, 40 miles distant, which complete the semi-circular mountain chain that makes such a beautiful background to the landscape. For mountain and valley scenery no more beautiful location can be found in the State than Redlands, outside of Yosemite valley.

Redlands is located 10 miles from the county seat, the same distance from Colton, and 15 miles from Riverside. The track of the Southern Pacific railroad runs one and a half miles from the center of the Redlands tract, and a depot will be established at once for the accommodation of Redlands, Lugonia, Crafton and Old San Bernardino.

The Redlands tract is laid off by running avenues from northeast to southwest, one-quarter of a mile apart and cross streets at right angles to those avenues every half mile, thus cutting the tract into blocks, each of which contains 80 acres. The avenues are each 100 ft. wide. The cross streets are 60 ft. wide.

Although the first work done on the tract by settlers could not be commenced till about the 1st of January, 1882, there are at the present time some 10 or 12 houses erected and in process of erection, with several to commence work soon. A number of tracts, in addition to those on which houses are being built, are being plowed up and planted to orchard and vineyard.

The lateness in the season when the land was bought by purchasers, prevented many from getting their land set out to trees or vines this year, but all who have purchased are making arrangements to plant extensively next winter and spring.

Town Plat.

Near the center of the tract is a town plat, consisting of 140 acres, cut up into lots ranging from an ordinary business lot to two and a half and five acre residence lots. Within this town plat, at the crossing of Palm and Center avenues, is a circular public park, with a fountain in the center. This park will be improved by the proprietors of the tract. Above the town plat will be constructed a small reservoir, from which iron pipes will be laid to supply the town with water under pressure.

The Water System.

Is one of the most perfect in the State. The water supply comes partially from the South Fork ditch of the Santa Ana river and partially from private water developments in the Santa Ana canyon and other localities. The waters are to be conducted to a large reservoir, located in a canyon adjoining the tract, and distributed from this reservoir by means of cement pipes. These pipes will be so laid as to carry the water without loss to the highest point on each ten-acre lot. The basis of water supply is one inch of water, statute measurement, to each eight acres of land. This is ample, and up to the best irrigated tracts in the State.

Work on the water system is being pushed as rapidly as men and money can do the work. The dam to the reservoir, which is ultimately to be 60 and perhaps 80 ft. high, is now about half done; the iron discharge pipes and watergates are in position, and nearly four miles of the largest distributing pipes are already manufactured, and most of this is laid. This portion of the work embraces the 8, 10, 12, and 14-inch pipes—the heaviest portion of the work. The smaller pipes, none of which will be less than four inches, will be made and laid as soon as the larger pipes are completed.

The orange, lemon, apricot, peach and raisin grape, will grow here to perfection.

Following is a list of the property owners at the present time. Those who have moved upon the tract are credited to Redlands, and the others to localities where they now reside:

Names.	Acres.
J. G. Cockshutt, Redlands	20
O. W. Kidder, Redlands	10
J. F. Webb, Redlands	20
B. W. Brown, Redlands	10
Israel Real, Redlands	20
O. E. Tuesdell, Redlands	20
R. B. Morton & Co., Redlands	30
O. A. Smith, Redlands	10

W. A. Merriam	10
J. T. Ford, San Bernardino	20
T. S. Ingham, San Bernardino	10
L. Jacobs, San Bernardino	90
Total sold	1,004

Judson & Brown (San Bernardino, P.O.), owners of the tract, are energetic men, who leave no stone unturned to make their enterprise a success. They do not try to figure how little they can do and sell their land, but where they can put another thousand dollars and make the tract more desirable to first-class settlers. There is nothing shoddy about their operations. Redlands will stand in a few years as one of the finest settlements on the Pacific coast.

Mining and Other Companies.

Persons interested in incorporations will do well to recommend the publication of the official notices of their companies in this paper, as the cheapest appropriate medium for advertising.

DIVIDEND NOTICE.

OFFICE OF THE

Bodie Consolidated Mining Company.

Room 62 Nevada Block, San Francisco, Sept. 27, 1882.

At a meeting of the Board of Directors of the above-named Company, held this day, a dividend (No. 11) of Twenty-five cents (25 ¢) per share was declared on the capital stock of the corporation, payable MONDAY, October 16th, 1882, at the office of Messrs. Laidlaw & Co., New York, only on stock issued from the Transfer Agency in that city, and at the San Francisco office only on stock issued here. Transfer books will close on Tuesday, October 10th, 1882, at 3 o'clock P. M.

GEO. W. SESSIONS, Sec'y pro tem.

DIVIDEND NOTICE.

OFFICE OF THE

Northern Belle Mill & Mining Company.

San Francisco, September 9th, 1882.

At a meeting of the Board of Directors of the above-named Company, held this day, Dividend No. 64, of fifty cents (50c) per share, was declared, payable on FRIDAY, September 15, 1882. Transfer books close until Saturday, September 16, 1882.

WM. WILLIS, Secretary.

Office—Room No. 29 Nevada Block, No. 309 Montgomery Street, San Francisco, Cal.

DIVIDEND NOTICE.

OFFICE OF THE

Bulwer Consolidated Mining Company.

San Francisco, September 25, 1882.

At a meeting of the Board of Directors of the above-named company held this day, dividend No. 11, of ten cents (10c) per share, was declared, payable on THURSDAY, October 12, 1882. Transfer books closed on Monday, October 2, 1882, at 3 o'clock P. M. This dividend is payable at the Farmers' Loan and Trust Company in New York on all stock issued there, and at the office in this city on all stock issued here. WM. WILLIS, Sec'y.

OFFICE—Room No. 29 Nevada Block, No. 309 Montgomery street, San Francisco, Cal.

IRON MINE FOR SALE.

An Iron Mine of three claims consolidated, situated two and a half miles from Rutherford, on N. V. R. R. Contains very large body of high grade ore, samples of which may be seen at this office. For particulars address,

MRS. D. S. ROHLWING,
St Helena, Napa Co., Cal.

ASSESSMENT NOTICE.

Gould & Curry Silver Mining Company.

ASSESSMENT, NO. 43.

Levied	August 24
Delinquent	September 28
Day of Sale	October 19
Amount per Share	Fifty Cents

ALFRED K. DURROW, Sec'y.

Office—Room 69, Nevada Block, 309 Montgomery St.

ANNUAL MEETING.

OFFICE OF THE EUREKA CONSOLIDATED MINing Company, Nevada Bank, Room 37, San Francisco' September 25, 1882. The annual meeting of the stockholders of the above-named Company, will be held at the office of the Company, Room 37 Nevada Block, San Francisco on MONDAY, October 16th, 82, at 1 o'clock P. M., of said day, for the election of five Trustees to serve to for the ensuing year, and for the transaction of such other business as may be presented.

W. W. TRAYLOR, Sec'y.

Engraving. Superior Wood and Metal Engraving, Electrotyping and Stereotyping done at the office of the MINING AND SCIENTIFIC PRESS, San Francisco, at favorable rates.

Guide to Silk Culture.

A Useful Manual for Beginners.

The "Silk Growers' Manual," by W. B. Ewer, contains, in a condensed and clear form, instructions for the sericulturist. We advise our lady friends to buy a copy.—*Fresno Expositor.*

Furnishes in a brief and explicit manner all necessary information in the matter of silk culture.—*San Jose Mercury.*

An interesting compilation to encourage home silk culture in California. Everybody should read it.—*Anderson Enterprise.*

Anyone interested in silk culture will find this full of valuable information.—*San Joaquin Valley Review.*

Furnishes all necessary information to begin the silk business.—*Marysville Appeal.*

It is a very interesting little work, and well worth the price.—*Mendocino Beacon.*

It is worthy the perusal of all interested in silk culture.—*Concord Sun.*

Copies of "The California Silk Growers' Manual" mailed from this office for 25 cents each.

ARTIFICIAL LIMB

Manufacturing Co.

(Incorporated by the State of Pennsylvania.)

Every Member of which Wears an Artificial Leg.

MANUFACTURE

Adjustable Lacing Socket Limbs.

The most comfortable and durable limb, and the nearest approach to the natural member of any invention of the age.

Write for Catalogue, which gives a full description of these Legs, with numerous certificates from persons using them.

When patrons can't visit our establishment we forward blanks to take measures.

ARTIFICIAL LIMB MANUF'G CO.,

279 Penn Street, Pittsburg, Pa.

J. W. THOMPSON,
Secretary & Business Manager.

San Francisco Pioneer Screen Works

J. W. QUICK, MANUFACTURER,

Several first premiums received for Quartz Mill Screens, and Perforated Sheet Metals of every description. I would call special attention to my SLOT CUT and SLOT PUNCHED SCREENS, which are attracting much attention and giving universal satisfaction. This is the only establishment on the coast devoted exclusively to the manufacture of Screens. Mill owners using Battery Screens extensively can contract for large supplies at favorable rates. Orders solicited and promptly attended to.

32 Fremont Street, San Francisco.

PACIFIC POWER CO.

Room with steam power to let in the Pacific Power Co.'s new brick building, Stevenson street, near Market. Elevator in building. Apply at the Company's office, 314 California street.

BOONE & MILLER,

Attorneys & Counsellors-at-Law,

Rooms 7, 8 and 9

No. 320 California Street, S. F.,
(Over Wells Fargo & Co.'s Bank

Special Attention Paid to Patent Law.

N. B.—Mr. J. L. Boone, of the above firm, has been connected with the patent business for over 15 years, and devotes himself almost exclusively to patent litigation and kindred branches.

The undersigned are agents for, and are prepared to furnish prices and all particulars for

THE BALDWIN LOCOMOTIVES, every style and for any service.

THE BALDWIN STEAM MOTOR for use on City and Suburban Roads.

FREIGHT CARS,

Builders of Steam Machinery

IN ALL ITS BRANCHES,

Steamboat, Steamship, Land

Engines and Boilers,

HIGH PRESSURE OR COMPOUND.

STEAM VESSELS, of all kinds, built complete with Hulls of Wood, Iron or Composite.

ORDINARY ENGINES compounded when advisable.

STEAM LAUNCHES, Barges and Steam Tugs constructed with reference to the Trade in which they are to be employed. Speed, tonnage and draft of water guaranteed.

STEAM BOILERS. Particular attention given to the quality of the material and workmanship, and none but first-class work produced.

SUGAR MILLS AND SUGAR-MAKING MACHINERY made after the most approved plans. Also, all Boiler Iron Work connected therewith.

WATER PIPE, of Boiler or Sheet Iron, of any size made in suitable lengths for connecting together, sheets rolled, punched, and packed for shipment ready to be riveted on the ground.

HYDRAULIC RIVETING. Boiler Work and Water Pipe made by this establishment, riveted by Hydraulic Riveting Machinery, that quality of work being far superior to hand work.

SHIP WORK. Ship and Steam Capstans, Steam Winches, Air and Circulating Pumps, made after the most approved plans.

PUMPS. Direct Acting Pumps, for Irrigation or City Water Works purposes, built with the celebrated Davy Valve Motion, superior to any other Pump.

WATER JACKET SMELTING FURNACES

—FOR—

Galena Silver & Copper Ores.

The PACIFIC WATER JACKET SMELTERS embrace many features that are entirely new and of great practical utility, which are covered by letters patent.

No other furnaces can compare with these for durability and in capacity for uninterrupted work.

MORE THAN SIXTY of them are now running on the Pacific Coast, giving results never before obtained as regards continuous running, economy of fuel, grade and quality of bullion produced. We are prepared to demonstrate by facts the claims here made.

These Smelters are shipped in a complete state, requiring no brick or stone work, except that for the crucible, thus saving great expense and loss of time in construction.

Complete smelting plants made to order of any capacity and with all the improvements that experience has suggested as valuable in this class of machinery. Skilled and experienced smelters furnished when desired to examine mines and to superintend construction and running of furnaces. Estimates given upon application.

Send for circular.

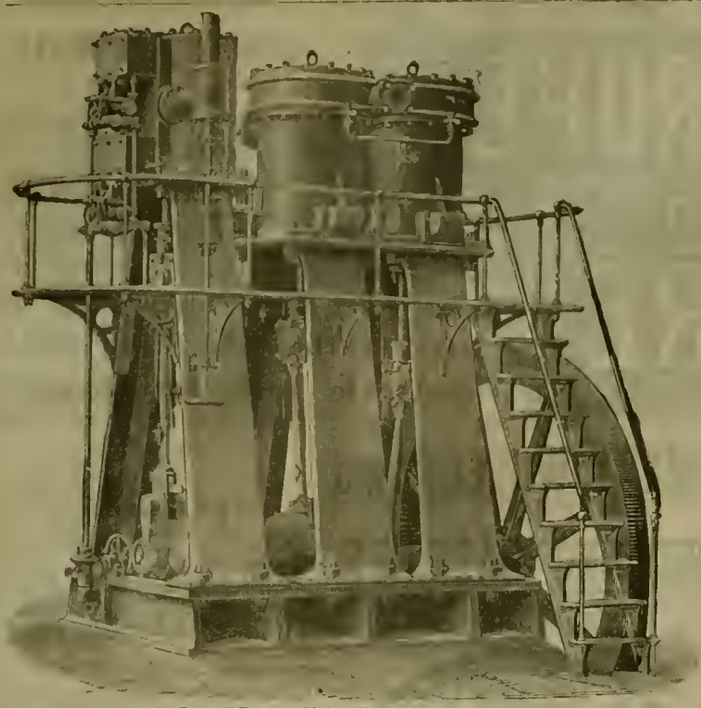
Engraving.

Superior Wood and Metal Engraving, Electrotyping and Stereotyping done at the office of the Mining and Scientific Press, San Francisco, at favorable rates.



With Adjustable Cut-off Poppet Valve Engine, and Forced Iron Crank Shafts.

Mining Machinery Depot,

PARKE & LACY,

21 and 23 Fremont Street. S. F.

NO. 7 IMPROVED

AIR COMPRESSOR.

SPECIAL ADVANTAGES.

Absolute certainty in the action of the valves at any speed. Perfect delivery of the air at any speed or pressure. The heating of the air entirely prevented at any pressure. Takes less water to cool the air than any other Compressor.

Power applied to the best advantage. Access obtainable to all the valves by removing air chest covers. Entire absence of springs or friction to open or shut the valves. No valve stems to break and drop inside of cylinders.

Have no back or front heads to break. The only Machine that makes a perfect diagram. No expensive foundations required. Absolute economy in first cost and after working.

DISPLACEMENTS in air cylinder perfect. Showing less leakage and friction than our competitors and a superior economy of about 20 per cent.

Small Sizes made in Sections not to Exceed 300 lbs.

PACIFIC MACHINERY DEPOT.

The Korting's Injector is the simplest, cheapest and best in use. Will draft its own water, hot or cold, and feed under varying pressure. Send for Circular.

MINERS' HORSE-WHIM.

One Horse can easily hoist over 1,000 pounds at a depth of 500 feet. The whim is mainly built of wrought iron. The hoisting-drum is thrown out of gear by the lever, while the load is held in place with a brake by the man tending bucket. The standard of the whim is bolted to bed-timbers, thus avoiding all frame work. When required these whims are made in sections to pack on mules.

NOTICE.

The old firm of MOREY & SPERRY, Manufacturers and Dealers in Mining Machinery, having been dissolved, a partnership has been formed between Eugene Sperry, Dudley S Steele and Nathan W. Condict, Jr., under the firm name of SPERRY & CO., to continue the manufacture of and dealing in all kinds of Mining Machinery and Supplies for Mills and Mines.

MR JAMES A. SPERRY, formerly of the firm of Morey & Sperry, whose experience extends over a period of 33 years, commencing in California in 1849, and embracing the western and southern sections of the United States, as well as Mexico and South America, will personally superintend the construction of the Machinery, and when desired, the erecting and starting of the same upon the ground.

The Machine Works and Foundry of MESSRS. STEELE & CONDICT in Jersey City will be especially at our service in filling orders, and we feel confident that our facilities will enable us to fill orders understandingly, promptly and at reasonable prices. Information and estimates will be cheerfully given.

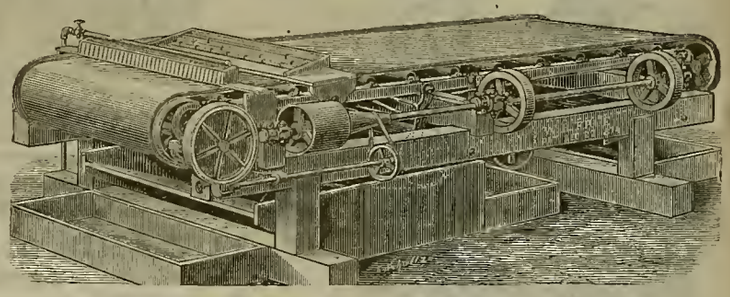
$1,000 CHALLENGE!


THE FRUE ORE CONCENTRATOR.
Nearly 300 are now in use, giving entire satisfaction. Awarded First Premium and Silver Medal at the Industrial Fair for 1880 of the Mechanics' Institute of San Francisco, Cal.
Saves from 50 to 100 per cent. more than any other Concentrator in use, and concentrations are clean from the first working. The wear and tear are merely nominal; water required is less than in any other wet Concentrator; the power required per machine is less than one-half horse power; the labor required is light, one man on a watch can attend to sixteen machines.
We challenge any other Concentrator in use for a fair and impartial competitive trial, side by side, for stakes of $1,000 each, and we mean business.
☞ A machine with all improvements can be seen in working order and ready to make tests, at the office of Hinckley, Spiers & Hayes, 220 Fremont street.
ADAMS & CARTER, Agents, Room 7 No. 109 California Street, S. F.

DEWEY & CO.'S
Scientific Press Patent Agency.

[ESTABLISHED 1860.]
Inventors on the Pacific Coast will find it greatly to their advantage to consult this old experienced, first-class Agency. We have able and trustworthy associates and Agents in Washington and the capital cities of the principal nations of the world. In connection with our editorial, scientific and Patent Law Library, and record of original cases in our office, we have other advantages far beyond those which can be offered home inventors by other Agencies. The information accumulated through long and careful practice before the Office, and the frequent examination of Patents already granted, for the purpose of determining the patentability of inventions brought before us, enables us often to give advice which will save inventors the expense of applying for Patents upon inventions which are not new. Circulars of advice sent free on receipt of postage. Address DEWEY & CO., Patent Agents, 252 Market St., S. F.

Concentration in Metallic Lead.

The amount of the precious metals extracted from their ores by the process of smelting, even including the silver obtained from the treatment of argentiferous galena, is small as compared with the annual production by amalgamation.

This mineral, however, although without exception containing proportions of silver, cannot be for that reason regarded as a silver ore. Since the value of the lead which it affords is generally far in excess of that of the silver and galena, it must, therefore, be considered as an ore of lead, affording variable quantities of the former metal. In the various processes which have been adopted for the extraction of the precious metals from their ore by smelting, advantage is taken of the affinity which lead possesses for them when in a fused state; and, consequently, it performs, when in that condition, a similar service to that rendered by mercury at lower temperatures. From the great facility with which the sulphides of silver are converted into an impalpable powder, which, by floating off on water, becomes commercially lost. The mechanical concentration of silver ore is a very wasteful operation, and hence the solubility of sulphides of silver in other fused metallic sulphides is generally made use of as a means of concentration. The gold present in the ore is also concentrated in these fused metallic sulphides.

This observation, as far as it relates to silver proper, is also to a great extent applicable to argentiferous galenas, in which the sulphide of silver, at least evidently to a great extent, exists in the form of a mechanical mixture, and consequently it is not generally advantageous to carry the mechanical concentration to a very advanced stage. From this circumstance, the processes employed for the metallurgical treatment of galenas rich in silver differ materially from those made use of for smelting ordinary lead ores, and the peculiarities of treatment adopted in some cases almost entitle them to be regarded as ores of that metal. The details of the various methods for the reduction of gold and silver ores are, to a greater or less degree, modified in accordance with the resources of the districts in which they are employed, and consequently the processes adopted in different localities are so exceedingly numerous and complicated that even a brief reference to all of them would occupy far more space than is at our disposal. The presence of gold in an ore of silver in no way modifies its treatment in the furnace, since the former metal invariably accompanies the latter, and is ultimately separated from it by the process of parting.

The Denver exposition closed, according to the original programme, on the 30th of September, having continued open for two months. Our correspondent will continue the publication of his letters until the entire mineral exhibit has been written up, full notes having been taken for that purpose before he left Denver.

New Engine Lathe.

The lathe illustrated herewith is made by the San Francisco Tool Company, of this city, and is in many respects a departure from ordinary practice in this country, or, as we should say, the New England type of tools. As there is seldom much change made in lathes, we propose to notice at some length the new features of this one. The lathe shown is 25-inch swing, the spindle gearing being the same as is usually found on Eastern lathes of 30-inch swing. The wheels are 16 inches, 4½ inches, 15 inches and 5 inches in diameter, respectively. The cone pully is 15 inches in diameter for the largest step, and receives a three-inch belt. From this the driving power can be estimated. The frames are of a hollow box section, and are inflexible, or nearly so, irrespective of foundations or working strains.

The lathes are usually arranged with both belt feed and wheel feed, although the former is not of much importance, because the screw feed is controlled by friction clutches, and starts instantly, while the wheel train is so arranged that only one wheel has to be changed in cutting standard threads from No. 5 to No. 20.

The lead screw is 2 inches diameter, and is placed in front where the greatest resistance comes. The screw nut is in halves, cut out from solid iron, and much more durable than soft alloys or brass.

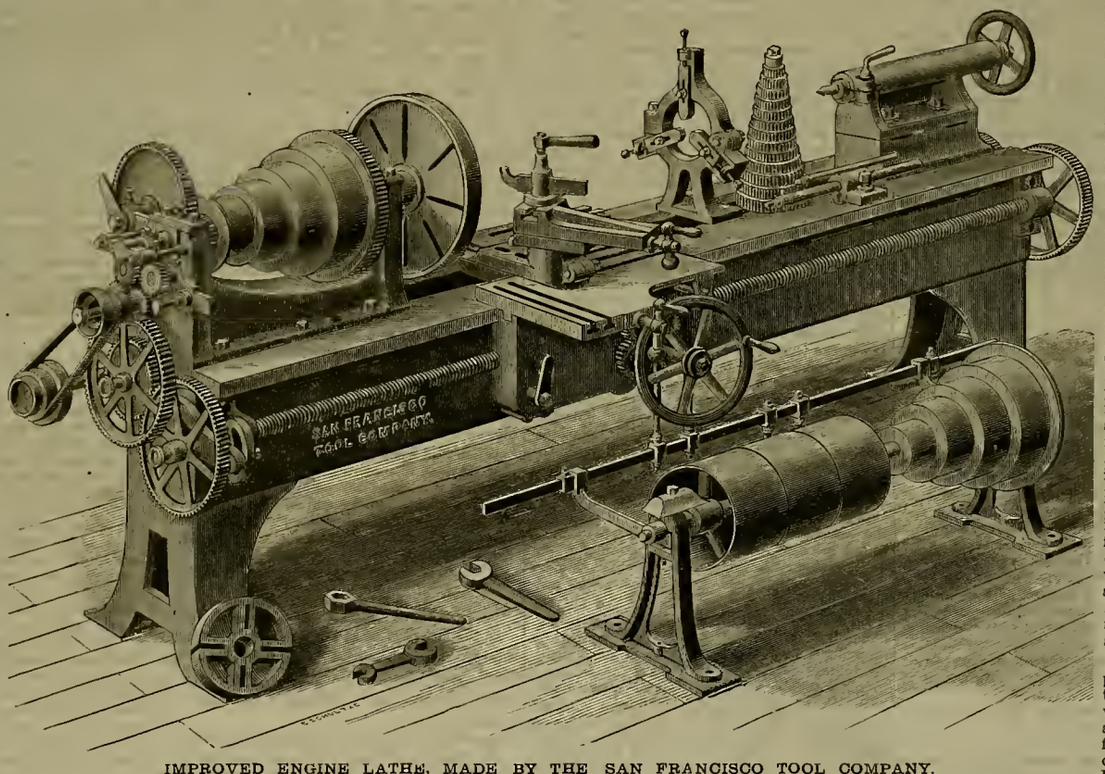
The wheel trains of all lathes of 25 inches and less are made with teeth of three-eighth-inch pitch. The tumble gears have one-half inch pitch.

The carriages are not mounted on V ways in the usual manner, but are gibbed the whole length on the edges of the frame, with a broad, flat bearing on top. This being a method of construction not common among American tool makers and often a subject of discussion, we have requested Mr. Richards, superintendent of the San Francisco Tool Co., to prepare a short essay on the subject, which will be published soon.

Another peculiarity of the lathes being described relates to screw cutting. We give below a list of wheels for standard threads, from which it will be seen that a No. 16 wheel stands for threads from No. 6 to 20.

Wheels 8 pitch, Screws 4 per inch.			Single geared.		
No.	Stnd.	Screw.	No.	Stnd.	Screw
1	64	16	10	16	40
2	48	24	11	16	44
3	32	24	12	16	48
4	36	36	13	16	52
5	16	20	14	16	56
6	16	24	16	16	64
7	16	28	18	16	72
8	16	32	20	16	80
9	16	36			

In the next table is shown the fractions that may be cut with a single train of wheels. Other or complex fractions can of course be cut by compounding the wheel trains.



IMPROVED ENGINE LATHE, MADE BY THE SAN FRANCISCO TOOL COMPANY.

Fractional Table.

No. of Threads.	Stnd.	Screw.	No. of Threads.	Stnd.	Screw
1½	64	24	3½	64	52
1¾	64	28	3¾	32	28
2	64	36	4½	32	36
2½	32	20	5½	32	44
2¾	64	44	6½	32	52

Pyramid Mines.—A good deal of prospecting is being done down near Pyramid lake, and some fine ore is being found. The veins are generally large The Roma-Union tunnel is in 800 ft., and work in it is being prosecuted vigorously. They have about 35 ft. to run to cut the vein, which on the surface has been proved by prospect shafts and drifts to be nearly 100 ft. wide. The tunnel has cut several large feeders to the main vein, one of which was 18 ft. wide, and several others about six. The mine is situated about 2,500 ft. northeast from the Jones and Kinkead.—*Virginia Enterprise.*

Manganese for Flux. — It is said the smelter at Charleston is successfully working the ore from the Tombstone mining company's property. The experiments of using the manganese ore from the Lucky Cuss for flux has proved successful, and men and teams will be busily engaged for some time to come breaking and hauling ore from the mine. Ten men have been employed to build a road to the mine in order to facilitate the transportation of ore,

Copper.

It seems pretty likely, from present appearances, that the price of copper will hold good for several months, at least. The lake companies have contracted with the principal consumers for some 12,000,000 lbs., at 18 cents per pound, the delivery at said price to extend up to December 31st of this year. This heavy transaction insures the price to that time, anyhow, and probably up to the opening of navigation in the lakes next spring. These transactions show that, although the production of copper has been very greatly increased, the consumption must also have increased. The mines on this coast now exercise some influence on the market, some of them being very heavy producers.

In Idaho, Montana, New Mexico and Arizona, many new copper properties are being opened up, and great attention everywhere is being turned to the metal. In this State there are comparatively few properties being worked. Arizona has assumed the most prominent position of any of the Western States in the matter of copper mining, and this is due, mainly, to the wonderful Copper Queen mine, in Bisbee district. Copper Queen's product ranks with lake copper, and sells for the same figure in the refined state. This is because it carries neither arsenic nor antimony, those debasing elements for rolling purposes. The ore from this mine is worked in a modern-style water-jacket furnace, and is easy to smelt. Baltimore copper is immovably quoted at 17⅜ and 17¾ per ton.

Chili exports of copper for the year, up to the end of last month, were 31,686 tons fine, as against 25,253 tons fine in 1881. Stocks of Chili produced in Liverpool and Swansea are equal to 23,140 tons fine; and stocks of other than Chili produced in Liverpool and Swansea, London and Havre, equal 13,347 tons fine. This, with what is afloat, makes a total visible supply of 51,430 tons fine. The imports of copper from January 1st to 1st inst., (exclusive of pyrites) amount to 51,353 tons fine. The price in Liverpool, as per James Lewis & Sons' quotations, in last monthly report, are as follows: Chili bars, £67 10s to £67 15s per good ordinary brands, usual terms, and £68 10s per ton with three months prompt. Good ore, 14s, and regulus, 14s 4½d to 14s 6d per unit.

Ex-Senator E. B. Dickinson, Superintendent of the Queen Springs property, was in town several days this week, says the White Pine *News*. He reports that they are taking out some good ore, and that the prospects in the mines for large quantities of the same kind are good. The development of these outside mines are of great importance to Cherry Creek, and we are always pleased to hear good reports from them.

The Lightning Drift.—The main west drift from the 2600 station of the Chollar-Norcross-Savage shaft is out over 280 ft. from the shaft. As it has but about 400 ft. to go to reach the vein, it will soon be an object of special interest to holders of stock in the middle mines.

Forest Trees of California.*

Magnificent Red Silver Fir.

(*Abies [Picea] nobilis var. Magnifica.*)

The fir grove murmurs with a sea-like sound.—W.

This most magnificent cinnamon-bark silver fir of the Sierrae—their valleys or intervales, steppes, meadow margins, or contiguous to cliffs of the ragged rocks—is by far the largest and most stately of all the firs. Found at an altitude of 7,000 to a little above 9,000 ft.; attains from 200 to 300 ft. in bigbt, 10 to 12 ft. in dameter, and is reported even 14 ft. In its glory we bebold the massive, towery and eomewhat rounded or domed sequoian summit; indeed its general port is even of more densely thickened outline than those giants of our Alps. The mass of this foliage is made up of formal, well-defined, round, table-like terraces, as in the typical *nobilis:* like branching, more or less in successive flights to the top, yet sufficiently broken, here and there, to preserve variety and still suggestively bold the mind to ideal order, dignity and grandeur the most imposing, the most magnificent. These innumerable segments of circles, silver lined and baized above, that deeply naps the ample folds of this broad mantle of eylvan magnificence, are but multiplied lines of regal beauty, perfection and eymmetry. The earlier etate of growtb does not greatly vary from that of age, but rather foreshadows it; the form, tben, is one of perfect regularity, on the precise conical plan, from a broad base by lessening turreted series of branches, whirling aloft to the conic or, at lengtb, sub-conic top, tipped by a strong, straigbt, rigid leader sboot of vigoroue growth. Perhaps tbis would proove too formal for the eye to dwell upon alone, but in nature tbey are never alone, nor in forests of their own. This strict outline is more bold viewed in midday among the mountains. It then and there stands in striking relief againet the usual rngged background of rocks and awe-inspiring alpine cliffs, and seems more barmoniously combined, complemented, and in due keeping witb higb mountain scenery. Yet, as a eingle object, or within a restricted circle, it is mucb more softened and silvered from beneath by the nightly camp-fire, or when naturally crimson-tired by rising and eetting sune. When thus aglow, diversified by other eylvan eurroundings, the picture ie one of surpassingly softened beauty—fascinating quite beyond description; the very warm, glowing bark of body and boughs, always lovely, now more radiantly reflective than ever, reminds us of that other "fir tree eet in the desert of the deserted"—eacred emblem of perceptive scientific trutb of a superior order. As the wind waves leave their own beautiful rippliog records on the highland sands, so do the water wavee leave theirs along the sbore; they also sing a similar song, the emblematic significance of which is nearly alike the same, for saith not the poet truly?

"The fir grove murmurs with a sea-like sound."

Hence it ie that hearts nicely attuned to nature's barmony in the great forestal variety full oft catch the grand orchestral ohant that swells sublime in the mountain hights or eweetly dies along the gale, and even the taoit echoes from some far-off song, perchance, comee softly swelling on the listening ear when a still small voice of silence is all about—above, below—and not a leaf astir among the boughs.

As for the serener haunts of the hermit mountain bird and the merry pine squirrel, the fir trees are tbeir house—a velvety bed, and board forever spread in silvered emerald. The beams of these temples are as the goodly cedars, and their rafters of fir, decked in gold and royal purple pillars, as it were, of the beaven's tent and table, silver lined, balsam perfumed, tbeir aire are pure and sweet as the breatb of lilies. Lordly shadows and secure shelters are they, where the weary pilgrim is wont to rest or repose in Eden sleep, on a virgin bed of boughs.

Dr. Englemann remarks: "Leaves of the young tree flat, scarcely grooved, never, I believe, notcbed; fibrous bundles in twos. On full-grown treee, and especially on fertile branches, tbe leaves are one-fourth wider than thick, or even perfectly square; the reein ducts in these leaves, placed equidietant from the edges and keel, separated from the epidermis by a layer of hypoderm cells, externally indicated by a green stripe dividing the bands of stomata, so that these leaves show four lower wbite bands. Cones six to eight inchee long, two and one-half to three and one quarter thick, purple; bracts lanceolate, shorter than the broad scale, wing of the slender seed very oblique, wider than long; the only seed examined had ten cotyledons." The scales flat and set borizontally, or uot bent, so as to cnp the cone.

The texture of tbe timber appareutly like cedar—darker beart; makes excellent firewood; hae been accredited valuable by eome writere, but we have no pereonal experience or observation of ite applied utility; said to have been cxteneively used in some localitiee, bnt from our observation of fallen treee in the foreet, it eeeme to us liable to epeedy decay when left expoeed to the weatber.

* From "The Forest Trees of California," by A. Kellogg; published by the State Mining Bureau. State Printing Office, Sacramento, 1882.

UMBRELLAS. — Pbiladelphia mannfacturee more umbrellae than any otber city in tbe world; tl e annual production is valued at $20,000,000.

Metallurgy of Nickel and Cobalt.

In a paper read before tbe Society of Chemical Industry at Manchester, and illnstrated with a fine collection of specimens lent by Messre. Wiggin & Co., Prof. Huntington remarked that an important feature in the recent progress of this branch of metallurgy is tbe rendering tbese metals malleable. In dealing with arsenical ores, Louyet's method is largely employed. For ores wbicb do not contain arsenic, the following method is said to be used: Tbe ore is first fused with iron pyritee, by wbich means the nickel is separated in the form of a sulphide. The regulus of mixed sulphides ie next treated, for the separation of iron and sulpbur, much in the same way as in the Swansea method of copper smelting; that is, by a eeries of calcinations and smeltings, the "metal," in some cases being finally roasted in a fused state, or treated with niter to remove tbe last traces of iron. The remaining sulpbur is tben easily got rid of, and tbe more or less pure oxide of nickel thue obtained is reduced to the metallic state in the same way as in the wet process.

It wae explained that thie method is sometimes applied to the treatment of the New Caledonian ore, a silicate of nickel and magnesia, containing, on the average, 7% to 10% of nickel. This ore, which is very plentiful, is now, bowever, for the most part smelted on the spot, much in tbe same way that iron is treated, and the metal exported to tbis and other countries in the form of pigs, containing carbon and about five per cent. of silicon, and, occasionally, a little antimony. The difference in cost for carriage between ore and pig amounts to about 20%. The pig is refined without expense for arsenic, by mixing witb it a euitable proportion of arsenical ore. Hitherto nickel has only been used in alloy witb other metals, as a whitening agent. The reason of tbis is that it could not be obtained in a workable form. Tbe metal resulting from tbe fusion of grain nickel ie always wanting in malleability and ductility, behaving in a eimilar way to wrought iron which has undergone fusion, and probably for a similar reason.

In 1879 Dr. Fleitmann succeeded in rendering nickel malleable by adding to it, wbilet in a etate of fusion, one-eight per cent. of magnesium, introduced throngh a bole in the top of tbe crucible, a few lumps of charcoal having been previously added. In this way it ie possible to produce malleable nickel, whicb can be welded to iron or steel at a white beat, and rolled into thin sbeets witbout separation. Dr. Fleitmann failed to get the same resnlts by the use of manganese, aluminum or calcium. Mr. Alfred Smeaton Johnstone, of the firm of Wiggin & Co., wbo had previously been experimenting witb manganese, has, bowever, succeeded perfectly in rendering both nickel and cobalt malleable by means of manganese. Commercial manganese (about 95%), or any ferro-manganese, may be used for the purpose, tbe presence of iron not destroying the malleability of the nickel or cobalt. Tbus the analogy between the treatment of nickel and cobalt and of iron wbicb bas undergone fusion is perfect. Tbe manganese is added a little at a time to the fused nickel or cobalt, wbicb is kept well etirred during the time, and finally poured ont into molds when tranquil. Tbe metal is considerably agitated by the escape of gas during the addition of the manganese. For most purposes, the addition of two per cent. of metallic manganese is eufficient, but when the maximnm degree of malleability and ductility is required, the quantity added may be increased to as much as five per cent., beyond which there is no gain nnder ordinary circnmstances. The manganeee left in the nickel need not exceed about two tenths per cent.

Zirc can, Prof. Hnntington went on to explain, be successfnlly alloyed with nickel by reducing tbeir oxides in a state of admixture. By rapidly fusing the alloy thns obtained, a tough, malleable and ductile metal can be made. The melting point of nickel is too high to admit of zinc being introdnced into it after tbe nickel is molten. The addition of one-tenth per cent. of maguesium ie said to improve the working properties of this alloy. It is not likely that important applications will be long wanting for a metal possessing such valuable properties as malleable nickel, the price (about four shillings a pound) being comparatively low. Malleable nickel anodes are already being substituted for the old cast anodes. The former certainly have a great advantage in tbeir uniformity of structure, whicb not only prevents, to a great extent, tbeir being eaten away irregularly, but also avoids loss througb secondary currents. The greater rarity aud consequent higher price of cobalt precludes its general nse in tbe metal etate. It is, bowever, said to be used for electro-plating, the articles coated with it being sold ae superior nickel plate.

In tbe couree of tbe diecuesion whicb followed tbe reading of the paper, Mr. A. H. Allen, of Sheffield, remarked that eome time since be paid a good deal of attention to the production of nickel from New Caledonian ore, and in tbose days we ueed to have the ore sent direct to England. Tbe ore ie now emelted out there, and imported to England ae a regulus, and thie practice bae entirely disorganized a great many experimenta made in England witb tbe view of ntilizing tbe ore in particular ways. Tbe plan whicb he adopted wae to treat tbe ore with acid, eulpbnric or hydrocbloric, and, after aeparating tbe eilica, to precipitate the iron by an equivalent amount of magnesia. The nickel waa next thrown down as sulpbide, by tbe combined reaction, witb an equivalent of magneeia and eulphureted hydrogen. The latter he generated by the action of the waste liquors, containing chloride or sulphate of magnesinm upon soda waste. The process was independently arrived at, bis object being, at the time, to utilize his waete magnesinm solutione from the nickel precipitation, and be did not realize the full importance of the reaction.

Stout-Hearted Men.

The Pains and Perils of Miners.

Our miners almost daily face dangere that require all the courage of a soldier on the battle field. Often tbey do things tbat reqnire even more cool aod steady courage than do the feats of tbe soldier, whicb are performed amid the roar, rush and excitement of battle, while the miner has no euch etimulus.

Ae related in the columns of this paper, recently, Roger Stinson had botb of his legs broken while at work in the Chollar croppings. Altbough the account of tbe accident that reacbed the ears of the public was but a brief mention of the fact, yet when we come to make inquiry, and learn all tbe particulars, we find that even in connection with so small an affair as this, there were displayed admirable conrage, devotion and stoical endurance of pain.

The accident occured 50 ft. below tbe surface of the ground. There were two caves or falls of rook. When Mr. Stinson was knocked down and partially covered up by the first, bis comrades did not besitate to run to bis assistance and do all in their power to extricate him, thougb a second fall of rock upon the same spot was imminent. Indeed, they were only driven back when the second mass was in actnal motion—falling. Twice was tbe unfortnnate man covered up in caves of earth and rocke, bnt his friends stood by him, though all abont them was crumbling and tbreatening to come in. When he was finally dug ont, he was, of course, utterly belpless as regarded locomotion. He was at once carried back to a place of safety, wben a messenger was sent for a surgeon. As tbere was a shaft 50 ft. in depth to be ascended, and the only way of reaching the surface was by means of a rope and bucket, the miners thought that a surgeon could come down into tbe mine, and in some way eo mend the legs of tbeir wounded companion, as would enable him to go up in tbe bucket.

When tbe surgeon came he said it was of no use to try to do anything witb the man down in tbe mine; he must be brought out. The miners descended and set to work upon the problem. The etrongest man among them stood erect in the drift, when the others lifted Stinson upon bis back. Witb a loog rope, the two men were tben lashed togetber, Stinson being so placed, that bis broken lege were well up from the ground.

The miner, witb bis living load thus lasbed upon his back, then got into the bucket and was boisted to the surface. At tbe enrface, the wounded man was carried into an old blacksmith shop, and laid upon the ground.

The surgeon then eplit up some old barrel etaves, and bandaged these temporary splints upon the broken limbs, preparatory to placing him on a wagon for removal to his bome.

When laid upon his back in the blacksmitb sbop, instead of bowling and bellowing about pain, Stinson asked bis companione to fill bis pipe and give it to bim, which, being done, be smoked as calmly as any old Indian brave conld have done under like circumstances.—*Virginia Enterprise.*

Duncan Concentrator.

In the last number of the PRESS we illustrated tbe Duncan concentrator, manufactured by the Pacific Iron Works of tbis city. The following item from the *Iron Age* relates to the same machine.

Another invention in tbis direction is that of J. S. Duncan, of San Francisco, consisting in the employment of a rotating pan, to which an oscillating motion is given. Tbe earth, sand and water are put upon the revolving pan at ite outer edge, and fall into a cbannel there formed. Tbe centrifugal force bas a tendency to tbrow the beavier or precious particles to the extreme onter edge, while the oscillating motion of the pan settles them to tbe bottom. As the operation is continued, and the material ie constantly tbrown up against tbe outer rim, the cbannel becomes filled witb precioue particles, while tbe sand lies on top and is filled up against the rim, forming a downward grade to the center of tbe pan, wbere it can be easily drawn off. A furtber advantage of the rotating pan results from the length of time necessary for the water to return to tbe center, tbne giving the particlee time to eettle. If the pan were etationary the water would flow directly from tbe peripbery to the center, and, baving but a sbort distance to cover, would be likely to carry eome of tbe precioue particlea witb it and waste tbem; but by revolving tbe pan tbe water ie forced to take a spiral course to tbe center, and thus cover greater epace, giving the particles time to drop out. Ae a consequence of thie, an increase in tbe volume of water ie felt more gradnally, and tbere ie no ruebing force to the center. Suitable arrangements are made for drawing off tbe preciona metal. S-shaped flanges are placed near the center of tbe pan, to break tbe force of the water and condnct the latter to a central aperture, wbere it ie discbarged.

Life of Mines.

Tbe Tombstone *Republican* says: The life of mines is a qnestion of more than ordinary interest to those wbo are asked to put their money into tbie kind of investments. There have been most senseless articles widely circulated, to the effect that silver mines never give ont, bnt on tbe contrary they uniformly grow richer the deeper they are worked. The history of Mexico, that oldest of silver-producing countries, ie a complete refutation of such pernicious statements, and when we come home to the United States, wbere eilver mining is less than a quarter of a century old, the wrecks of once rich mines are to be found from one end of tbe country to tbe other. The Comstock lode is the exemplar of this fact; discovered in the eummer of 1859, and actively worked eince the spring of 1860, since when it has enriched the world by $365,000,000, a sum only excelled by perhaps three or four individnal lodes in the world, it is virtnally a dead lode, ite riches having been exhausted witb the Con. Virginia and California bonanza, the largest single body of ore that we have any record of. Its life has been 20 yeare, the last two having sbown nothing worthy to rank it among prodnctive mines.

Humboldt, White Pine, Pioche, Pahranegat, Palmetto, Cerro Gordo, Kearsarge and Panamint, with many other districts, have, since the discovery of the Wasboe mines, come npon the stage and played their part and passed off again. Tbese, alone, in the one State of Nevada. How many eimilar observations migbt be made of the mines in Utah, Idabo, Montana and Colorado, we are not in a position to say, but doubtlese they are as nnmerous as in Nevada. The oldest productive gold mine that we know of ie the Idaho, at Grass Valley, Nevada county, California. That has been steadily paying dividends for a little over 13 years, having paid 158 consecutive dividends, aggregating $3,279,750. Tbere is no other mine of the precione metals that can show encb a record. It ie safe to say that the life of individual minee will not average above 10 years. There was no mine on the Comstock lode that bad an active paying existence of more than half that term.

The fact that the life of mines is short ought not to militate against the business. For the period that tbey are in bonanza the profits are enormous, being many times their first cost. A table ehowing the actual profits of virgin mines would be most interesting reading. Take Contention for an illnstration. Purchase price, $10,000; two assessments ($100,000 each) $200,000; total, $210,000. Dividends, over $2,000,000, witb another year's in sigbt, say $3,000,000, dividends up to one year from this date, and we bave over 14 times the first outlay. After repayment of first cost, the profits have been 13 times the first investment. This is only one out of many which go to illustrate the fabulous profits to be derived from a judicious investment in mines.

A Terrible Fall.

Says John B. Gough: A minister of the gospel told me one of the most thrilling incidents I have beard in my life. A member of his congregation came bome for the first time in his life intoxicated, and bis boy met him upon the door step, clapping bis hands and exclaiming: "Papa has come home!" He seized tbat boy by the shoulder, ewnng him aronnd, staggered and fell in the hall. That minieter said to me: "I spent the night in that house." I went out, hared my brow that the night air might fall upon it and cool it. I walked up and down the hall—there was the child dead! There was his wife in strong convulsions, and he asleep—a man of about 30 years of age, asleep, with a dead child in the house, having a blue mark upon the temple where the corner of the marble eteps had come in contact witb the head as he swung him round, and a wife upon the brink of the grave.

"Mr. Gongh," said my friend, "I cursed drink. He told me that I must remain until he awoke, and I did. When he awpke, he passed his band over his face, and exclaimed: 'What ie the matter? Where am I? Where is my boy?' 'You cannot see him.' 'Stand out of my way; I will see my boy.' To prevent confnsion, I took bim to the child's bed, and, as I turned down the sheet and ehowed him the corpse, he nttered a wild shriek: 'Ah, my child!'" That minister said further to me: "One year after tbat he wae brougbt from a lunatic asylum to lie side by side with bis wife, in one grave, and I attended his funeral."

The minister of tbe gospel wbo told me that fact, is to-day a drunken bostler in a stable in Boston. Now tell me what rum will not do? It will debase, degrade, imbrute and damn everything that is noble, bright, glorione and godlike in a bnman being. There is nothing drink will not do that ie vile, daetardly, cowardly, eneakisb or bellish. Why are we not to fight it till tbe day of our death?

A RAILWAY engineer, eaying tbat the usual life of a locomotive wae only 30 yeare, a paseenger remarked tbat encb a tough-looking thing ought to live longer than tbat. "Well," responded the engineer, "perbaps it would if it didn't smoke eo much."

MINING projecte are out of favor. People are aick of the bole bneiness.

MECHANICAL PROGRESS.

Interchangeable Systems of Manufacture.

The London *Times* comments on the American system of what is called "assembling" in manufacture, as follows:

Among the various phases of the manufacturing interests, it is worth calling attention to the rapidly-increasing development in the United States of the interchangeable system, which has of late years become so important, and been applied to so many different branches, that it has been thought worth while to devote a special report to it in the census investigations. Mr. Fitch, to whose hands this inquiry was intrusted, remarks that not only American manufactures, but also American agriculture depend largely for their success upon the application of this particular feature. The art of making complete machines or implements, each part of which may be introduced into any machine of the same kind, and especially the adaptation of special tools by which handwork in fitting the parts is often entirely avoided, is one of American origin. The farming classes have been benefited in an extraordinary degree by the interchangeable system, for they are enabled to provide themselves with every kind of implement at a great reduction of price, as well as of manual or muscular exertion, while the durability and working performances of the implements are notably increased. Nor is it only agricultural machinery that is thus affected, the system being applied with equal success to sewing machines, watches, firearms, railway cars, locomotives, etc. The development of one of these branches of manufactnre, viz., firearms, there being now 38 establishments on the interchangeable plan, mostly in Connecticut, Massachusetts and Pennsylvania, employing nearly 6,000 hands, and having a capital of over $80,000,000,000. America stands high in the estimation of the world for firearms and ammunition, since 1867 the Danish, Swedish, Spanish, Egyptian and Japanese governments being supplied with American arms and machinery, as well as Chile, Peru, Mexico and the Argentine republic. During the late Turco-Russian war both belligerents were furnished from American armories, and the Prussian government arsenals at Spandau, Erfurt and Dantzic are supplied with American gun-making plant.

New Locomotives.

Mr. E. W. Webb, superintendent of the London & Northampton railroad, has invented a locomotive to economize fuel by the use of both high and low steam. There are two sets of driving-wheels, which are not connected, but each set is driven by independent engines. The steam is first received, under high pressure, in two cylinders, placed on each side of the boiler, and about half way back. The pistons of these work the rear drivers by direct motion. The steam from them is then exhausted into pipes, which are conducted in front of the boiler flues, to keep the steam hot, and then into one large cylinder located directly under the front of the boiler. This cylinder carries, by a shaft under the boiler, the forward drivers. A saving of over 25% upon ordinary requirements is made in coal.

Another fuel-saving locomotive is being tested on the St. Louis & San Francisco railroad, which is known as the shut-down engine. In a trip from Springfield, Mo., to the mouth of the tunnel through the Boston mountains at Winslow, in Arkansas, and from there to Wichita, Kansas, returning to Springfield, a distance of 750 miles, it attained a speed of 50 miles an hour. To this engine is attached a smoke consumer and smoke arrester, and during the trip above referred to, no smoke was observable while the engine was working, though some could be seen to escape when the steam was shut off. It is stated that the consumption of fuel was at least one-third less.

RULE FOR SETTING A SAFETY VALVE.—The following is the rule to find the weight necessary to put on a safety-valve lever when the area of a valve, pressure, etc., are known: Multiply the area of valve by the pressure in pounds per square inch; multiply this product by the distance of the valve from the fulcrum; multiply the weight of the lever by one-half its length (or its center of gravity); then multiply the weight of valve and stem by their distance from the fulcrum; add these last two products together, and subtract their sum from the first product, and divide the remainder by the length of the lever; the quotient will be the weight required.

METALS, and especially steel, brought to a cherry-red heat and strongly compressed, the pressure being continued until the mass is perfectly cold, are said to acquire an excessive hardness, and a striking fineness of grain. Steel thus treated acquires a coercitive force which enables it to become magnetic. The durability of this property requires to be studied.

A GOOD rivet, cold, should bend double without breaking. The head should flatten out, when hammered hot, to ½ inch thick without fraying at the edge or breaking. Boiler plates should be caulked with a convex tool,

Substitutes for Steam.

It is known that the expansion of liquids by heat takes place with such force that practically it may be considered irresistible, while vapors being elastic, any resistance causes compression. It is true that the expansion of liquid into a vapor causes an expansion many hundred times equal to the volume of the liquid, and that the expansion of the liquid itself by heat is very small; but in compensation for this, the force developed is enormous.

This is now being applied to develop power, and experiments made in London, in which either oil or glycerine is made to perform the functions of steam by the same means—the application of heat—have excited no small interest. The heat expanding the oil placed in small cylinders, a pressure of 10,000 lbs. per square inch may be obtained without the danger of steam explosions, which latter prevents the use of a pressure of more than 200 lbs. to the square inch generally. In this instance an explosion will only crack the cylinder containing the oil. The application of this process appears, from the accounts published, to have been successfully made to the printing press, and to machines for riveting and punching, and it is alleged that the variety of uses of which it is susceptible will be found very great.

It is known that the rapid motion of a steam piston may, by gearing and belting, be made to produce a very slow but powerful motion over a very small space, able to punch and cut iron plates, otherwise requiring tons of pressure to penetrate, and it is equally evident that this operation may be inverted, and that a slow and very powerful motion over a small space (as is obtained during the expansion of liquids by heat) may, by gearing and belting, be made to produce as rapid a motion as is obtained by any steam engine.—*American Manufacturer.*

MODERN BUILDING is often contrasted to its great disadvantage with building in ancient or mediæval days. How much scamped work was done in Rome, or Venice, or Paris, or London, or provincial cities in any country of old, no one knows, because only substantial structures lasted. But no doubt there was more good building in proportion to the whole than now. No doubt, either, the poor were lodged in hovels infinitely more uncomfortable than the houses they occupy in the modern world. As for the enduring buildings, they were built for men before whose eyes things were shifting rapidly. A merchant could not safely reckon that his great-grandchildren or men of their generation would carry on his business in his shop; it was wise, therefore, to make its walls thick, to finish its wood-work well, and to ornament it in an appropriate manner. So it was throughout Europe, men built well because it would have been wasteful to build badly. Men build badly now because on the whole it would be wasteful to build well. The supply of structures is equal in stability and beauty to the demand. But because it is inevitable that makeshift structures should be run up when population grows rapidly, it does not follow that buildings should not be sufficiently looked after to secure the public safety and health.—*Builder and Wood-Worker.*

INTERESTING PRE-INDIAN RELICS FROM VIRGINIA.—Mr. M. S. Valentine, of Richmond, Va., has sent to the Anthropological Institute of London, for exhibition, a collection of very curious articles fashioned in soapstone and clay, which were found lately between the ranges of the Blue and Alleghany mountains, near Mount Pisgah, North Carolina. The objects are said to be of a type absolutely unique, consisting partly of human, partly of animal figures, either in the round or in various degrees of relief. Some are household utensils. They appear to have been sculptured by metal instruments, so perfect is their workmanship. The human type is alike in the various objects, but is not Indian. All are fully clothed in tight-fitting garments. Some are seated in arm-chairs, others on all sorts of animals—bears, prairie dogs, birds, and other shapes belonging to North America. But some also represent types of the old world, such as the two-humped camel, rhinoceros, hippopotamus. Some of the specimens were obviously made since the advent of the whites, and these are fresher looking and of ruder workmanship. The inference hazarded is that the articles were made by an earlier and more civilized race, subjugated and partially destroyed by the Indians found in Virginia on the arrival of white men.

A NEW SCREW.—It is well known that screws when used in soft wood are usually driven in with a hammer, and given a turn or two with a screw-driver to bring them flush. Recognizing this fact, a manufacturer has brought out a new screw which is adapted for driving, and which enters the wood without tearing the grain. The gimlet point is dispensed with and a cone point substituted. The thread has a pitch that it drives in barb fashion, offering no resistance in entering, but firmly resisting all attempts to withdraw it except by turning it with a screw-driver.

LUBRICATING MATERIAL.—For general purposes of lubrication, sperm oil answers best; next, winter-strained lard oil. For high speed and heavy pressure, add finest air-floated plumbago (graphite, black lead). For cooling heated journals, use flour of sulphur and olive oil. For curing badly scored journals, use lead filings.

SCIENTIFIC PROGRESS.

Is Man the Highest Animal?

The measure of zoological rank is the specialization exhibited by all the organs, taken collectively. Specialization may be exaggerated in one or several organs, without the animal therefore attaining, as a whole, a high rank. This is the case in man. The measure of specialization is afforded by embryology, which shows in earlier stages the simplicity and uniformity of structure, which, in later stages, is replaced by complexity. The human body preserves several important embryonic features. In man we find three series of high differentiations, namely, in the brain, in the changes induced by or accompanying the upright position, and third, in the opposibility of the thumbs to the other digits. These are the principal, though, of course, not strictly the only characteristics of man, which show that he is more specialized than any other animal. In other respects he shows a still more striking inferiority. It is, of course, a familiar observation that his senses are less acute than those of many animals—he has neither the keen vision of the falcon, nor the delicate scent of the dog. He is equally inferior in many structural features. His teeth are of a low mammalian type, as is shown both by his dental formula and by the presence of cusps upon the crowns of the teeth, a peculiarity of the lower mammalia, entirely lost in the horse, the elephant, and many other "brutes." His limbs show a similar inferiority, since they are little modified, preserving, even, the full number of five digits; and in respect of these members, man stands, therefore, very low—lower than the cow and the pig. He plants the whole sole of his foot upon the ground, yet none except the lower mammalia, together with man and his immediate congeners, are plantigrade. So, too, with his stomach, which is so simple as compared with that of a ruminant, and, indeed, is about the same grade as that of the carnivora. It makes, however, a still more forcible impression to learn that the human face, which we admire when withdrawn under a high intellectual forehead, is, perhaps, the most remarkable of all the indices that point out man's inferiority. In the mammalian embryo the face is formed under the fore brain or cerebral hemispheres. In our faces the fetal disposition is permanently retained, with changes which, when greatest, are still inconsiderable. In quadrupeds the facial region acquires a prominent development leading to the specialization of the jaws and surrounding parts, which brings the face to a condition much higher than that of the fetus. Hence, the projecting snout is a higher structure than the retreating human face. These facts have long been familiar to anatomists, but I am not aware that the inferiority of the human to the brute countenance has heretofore been considered a scientific conclusion by anyone. Yet that inferiority is incontrovertible and almost self-evident.

The preceding statements render it clear to the reason that man is not in all respects the highest animal—and that it is a prejudice of ignorance that assumes that the specialization of the brain marks man as above all animals in the zoological system. It does give him a supremacy by his greater power of self-maintenance in the struggle of the world, but that has nothing whatever to do with his morphological rank. There is nothing in morphology that anywise justifies assigning, as is actually done, an almost infinitely greater systematic value to the specialization of the brain and a specialization of the limbs, stomach, teeth, face, etc.; hence it is impossible to call man even the highest mammal. It is also doubtful whether mammals would be regarded as the highest class of the animal kingdom, were they not our nearest relatives. Let us beware of claiming to be the head of organic creation, since the carnivora and ungulata are, in many respects, higher than we. I believe that it is just as unscientific to call any one animal species the highest, as to pitch upon any one plant to stand at the head of the vegetable kingdom.—*C. S. Minot.*

A LUNATIC'S EXPLANATION.—The insane often entertain the most ludicrous idea of their own condition. There is a man in an asylum in one of the neighboring States, who became insane in consequence of a failure in business. He explains the reason of his incarceration as follows: "I am here because of a mere mistake in business. I was engaged during the winter in making mosquitoes' wings, which I expected to sell in the summer. I had 10,000 of them on hand when the season opened, but unfortunately I had forgotten to make them in pairs. They were all left-hand wings, and consequently I lost the sale of them, and was compelled to suspend payment." He relates this story with a gravity and earnestness which testifies to the sincerity of his own belief in the explanation.

NEW SOURCE OF OZONE.—The essences of odorous plants, such as clover, mint, lavender, juniper, lemon, bergamot, are stated by Prof. Mantegazza to be even more powerful in developing ozone in sunlight than is phosphorus. He suggests that such highly odorous plants should be freely planted about houses in miasmatic regions.

Floating Matter in the Air.

Prof. Tyndall has collected in a volume under the above title his well-known lectures and monographs on "Dust and Disease," "Optical Deportment of the Atmosphere in Relation to Putrefaction and Infection," "Further Researches on the Deportment and Vitality of Putrefactive Organisms," "Fermentation and its Bearings on Surgery and Medicine" and "Spontaneous Generation," adding to each such notes as bring the latest results in each topic, down to the time of publication. Whatever Tyndall finds worthy of his investigation and exposition, the public has long known to be most worthy of its own study. And few men, especially scientists, are so capable of refreshing the most arid subjects by the charm of diction and even splendor of style.

But these subjects are in themselves startlingly important. They include the question of spontaneous generation, and may, in one contingency, cast more than a doubt upon all special creation. They exhibit a method of searching for organisms which are too minute, even, for the microscope. They restore dying industries by exhibiting and destroying the parasitical disease. They indicate such new surgical treatment that gangrene and mortification have lost their chief terrors. Certain forms of human and other animal disease, notably the dreadful splenic fever, they ward off by a preventive, as effectual as vaccination itself, and they promise, under the strongest probabilities of success, that they will soon similarly withdraw the venom from diphtheria, all the malignant fevers, cholera and the plague itself.

Nothing can be more fascinating than the history of the experiments thus far made. The shining, mote-teeming bar of light revealed in a dark room by letting in a ray of the sun, is shown to be the atmospheric play of the potential germs of disease and death. This laden air we must breathe. If, from whatever cause this morbific germs find in us anywhere an appropriate *nidus*, we are at the mercy of these invisible and terrific powers of the air. No larger subject has appealed to any of us for many a day.

The experiments of Pasteur, and Schwann, Lister, and more than all, of Tyndall, as here detailed, offer results to which science can attach but one logical meaning—that life can come only from antecedent life, and that the germs of disease assail us with every breath, seeking to make an entrance for death.

FUNERALS AS DISEASE BREEDERS.—There is good reason to believe that disease is occasionally disseminated through the medium of funerals. We have at least one fair authenticated instance in this country of diphtheria being diffused broadcast through the crowding incidental occasionally to the last ceremony. In America this question is beginning to receive much attention, and several cases have been reported of late where the transmission of the disease from the corpse seemed highly probable. The Suffolk District Medical Society sent out 400 circulars to medical practitioners, with a view to ascertaining the opinion of the profession on the alleged danger of permitting public funerals of persons who had died from diphtheria. Two hundred and thirty-nine answers were received. Of these, 143 writers expressed a belief in the possible danger of contagion at such funerals; 17 believe that there is danger from funerals in the houses of the dead, but none in churches; 29 fancy that, in the present state of knowledge, there is no justification in prohibiting public funerals; and 8 record circumstances which occurred in their own experience confirmatory of the proposition that peril may ensue; but the testimony these latter advance is not quite satisfactory. The society, after due consideration, recommend that funerals at the houses of those who have died of diphtheria should be private, owing to possible exposure to the poison of the disease.—*London Lancet.*

WHAT NEXT?—A distinguished German professor recently announced that if a drop of human blood was placed under a microscope capable of magnifying it twenty millions times larger, it would show all the kinds of animals that ever existed, or now exist on the earth. In the blood of a healthy person the animals are quiet; in that of a sick person they fight. From this he drawe the conclusion that man has within him all the elements from which the universe was created. He further says that if a dead cat was flung into a pool of water and left to decompose, the drops of water would show, when under a microscope, all the animals belonging to the cat species.

SUN SPOTS AND GREAT STORMS.—Prof. Coach, of Des Moines, Iowa, advises those living in exposed places to provide cellars or caves of refuge for shelter, when the sky looks threatening in the southwest. He says that 1882 is the maximum year of the 11.1 years of sun-spot period, and also the maximum year of two other periods, a long and a very long period; and the same degree of energy that gives the maximum sun-spot period, also gives the American continent maximum rainfall and a marked degree of force in the effects of the storms; and the end is not yet.

ELECTRIC STORAGE.—A New Haven man has taken out a patent for an invention of his which he claims secures the absolute storage of electricity for electric-lighting purposes.

Bullion Shipments.

We quote shipments since our last and shall be pleased to receive furtber reports :

Star, Sept. 29th, $1,691; Yellow Jacket, 30th, $14,663; Head Center, Oct. 4th, $6,191; Navajo, 2d, $16,000; Silver King, Sept. 23d, $13,000; Conteution Con., $20,900; Horn Silver, 28th, $5,000; Hananer, 28th, $2,750; Germania, 28th, $2,520; Horn Silver, 22d, $10,000; Bullionville, 27th, $3,334; Horn Silver, 26th, $15,000; Hanauer, 26th, $1,640; Germania 26th, $1,430. The shipment of metals from Salt Lake for the week ending Sept. 23d, 1882, comprised 37 oars of bullion, 858,664 lbs; one car copper matte, 30,270 lbs., sent East; eigbt cars hullion, 191,743 lbs., and two cars ore 59,000 lbs., sent West; making a total of 48 cars, aggregating 1,138,677 lbs.

THE relics brought back by Melville from the Arctic regions were unpacked at the Navy Department.

Mining Share Markets.

There are no special features to record in the mining share markets, other than the fluctuations which our tables show. Up on the Comstock, at the north end, very little prospecting is now being done, but preparatory work is in progress for very extensive explorations. In a very few weeks, great activity will be seen from the Ophir, all the way ont to the nortb side of the Sierra Nevada.

The joint Ophir and Mexican winze is also a point of much interest to mining men. It is going down in ground wholly new. It is now a few feet below the 3000 level, and will soon be the deepest opening on the Comstock or on the continent. In it the stratification is becoming more vertical, an indication that the hanging wall is straightening up, and that the vein is liable to be found compressed into much less space than it occupies on the levels above, thus concentrating the now scattered ore.

Much prospecting will also be done in the Con. Virginia and Best & Belcher section as soon as the north and south drifts on the 2500 level are connected, and a circulation of air obtained. In the middle mines, active explorations will be resumed by the several companies as soon as the present west drift from the Chollar-Norcross-Savage shaft has tapped and drained the vein on the 2600 level. The completion of this drift will give the Savage, Hale & Norcross, Chollar and Potosi full command of all the ground lying above the 2600 level—ground which they have heretofore been unable to explore. There is now some bope of a fresh start being made in the flooded mines, in the Alta and all the mines in that direction.

SANTA CRUZ FAIR.—The Santa Cruz County Agricultural, Mechanical and Manufacturers' fair will be held at Olympic hall and adjoining buildings, in the city of Santa Cruz, on the 19th, 20th and 21st of October, 1882. There will be a full display of the products pertaining to live-stock, field, orchard, garden, forest, shop, manufacturies, fine arts and natural history. The Executive Committee are: F. A. Hihn, Martha Wilson, Jos. Francis, E. B. Cahoon, Martin Kinsley, Mrs. B. Kooser, W. W. Waterman. It is expected that the fair will be a notable success, and all should contribute to it.

THE amount of silver dollars issued from the mints during the week ending September 30, 1882, was 561,499, against 656,993 for the corresponding week for the previous year.

ENGINEER MELVILLE, of the Jeanette, had to borrow a uniform from a brother officer for the purpose of reporting in person to the Secretary of the Navy his return from the Arctic.

IT has been decided to bring a number of noncommissioned officers of the Indian regiments from Egypt to England so that the Queen may present them with war medals.

THE Supreme Court of Illinois has decided that the Railroad and Warehouse Commissioners have authority to regulate fares and freights to points outside of the State.

A Good Camp.

Every camp must have good mines in order to flourish. The truth of this proposition needs no demonstration. That two and two make four is no more plain, yet we are inclined to believe that many good camps could be made better by proper manipulation of the exterior as well as the interior developments even in good camps.

Prospect work is good, but is there not too much haphazard work done? Could not better results be attained by a more thorough line of attack? are questions that should have consideration.

We do not offer the above remarks as censure to our own camp, but on the other hand, as far as our observation bas gone, we commend the spirit and energy with which the different companies have expended means in the development of their respective properties, and with good results. That the Reef will be a good camp for many years, is no conjecture, but a confirmed fact.

But these confirmations have not been reached by mine owners settling down in their minds that their properties were bonanzas. What they believe to be true they have proven to the public by substantial workings.

To one acquainted with Pioche and other Nevada Camps, with their rush-and-drive business, the Reef would appear tame, but any camp that can keep upwards of 600 men constantly employed, with weekly shipments of nearly $20,000 in bullion, speaks loud and encouraging.

For some time past we have not given proper attention to mining interests, but in the future we design writing up the different mines that those abroad may see we have the banner camp of Utah.—*Silver Reef Miner.*

News in Brief.

THE bonse of A. T. Stewart & Co., in New York, has closed its doors.

ELECTRICITY displaces oil in forty-two light houses on the French coast.

SIX HUNDRED Jewish families have left Pressburg on account of the riot.

THE revenne for 1882 in Russia exceeded the estimate by 9,778,000 roubles.

A GRAND review of the British troops was held Saturday at Cairo, Egypt.

A SOUTH AMERICAN steamer has just taken to England 100,000 beef tongues.

LADIES are candidates for School Superintendent in both Yolo and Shasta counties this year.

THE Khedive has conferred the Grand Cross of the Order of Osmanli upon Admiral Seymour.

PLANS are being matured for lighting the Chicago river tunnels and new City Hall with electricity.

MORE than fifty divorce suits have been commenced in the Superior Court in San Francisco this month.

THE Indian who killed a doctor for not curing his child has been hanged at the Klamath Agency, in Oregon.

A TRAIN was stopped and robbed on the Atchison, Topeka and Santa Fe railroad near Granada Saturday night.

THE steamer R. E. Lee was burned Saturday morning about thirty miles below Vicksburg, with terrible loss of life.

MINING SUMMARY.

The following is mostly condensed from journals published in the interior, in proximity to the mines mentioned.

CALIFORNIA.

AMADOR.

JACKSON.—Amador *Ledger*, Sept. 30: This mine continues to look well, under the prospecting operations now being conducted. There seems to be abundance of rock, and of good quality, and everything bids fair for a good paying mine.

MOORE.—This mine has been bonded by the parties operating the Jackson. A new shaft is to be sunk, at a considerable distance from the present one, with the design of thoroughly prospecting the claim.

MOORE MILL.—This mill is almost ready to be started up on rock from the Jackson. Pipe is being laid to bring water from Horne's ditch.

THE Kelly mine was to resume work this week.

MONO.

BODIE.—*Free Press*, Oct. 3: There is great activity and energy displayed in and around the Bodie, Standard, Oro and the Noonday mines these days. Wood and lumber are being hauled, and everything is being put in shape for a run during the winter. At the Bodie a large force of masons and carpenters are at work preparing for the new machinery. The bullion shipments from this mine hold out well, and the lower workings show large quantities of rich ore. The shipments of bullion from the Standard and the Noondays prove that they too have rich ores in sight. The Syndicate mill is now crushing rich ore, and the mine is looking first-rate. Interest in the Oro mine still continues. The mine never looked better than at the present time.

ORO.—The south lateral drift from the bottom of the north winze, 520 level, has been extended and timbered 12 ft during the week; total distance, 20 ft. The vein is in good ore, contracting and expanding almost daily, but continuous and carrying good ore throughout. During the past two or three days it has been quite narrow. Monday evening it showed a rich ruby streak an inch wide, widening to 3 inches in the bottom of the drift. The last assay of this ruby quartz vein, taken 4 days ago when it was 3 ft wide, went, gold, $30.13; silver, $103.70. The winze on the 714 level has been sunk and timbered 7 ft; total length, 49 ft. A north lateral drift has been extended thence 6 ft. The ore body, hitherto reported as appearing best on the south side of this winze, having crossed the bottom, apparently dipping north. This drift is started to follow it, as well as to develop, at an additional depth, the good ore found in the main north drift above. This is a pay-ore vein, showing well in ruby silver and black sulphurets, in this lateral drift 6 inches wide. The north drift, 714 level, has been extended and timbered 10 ft during the week; total distance in, 107 ft. The ore has improved in this drift. The ore body is solid and gives promise of increasing. This is a very fair development in itself, considering that the same character of ore has been found 200 ft above this point, and 300 ft north.

SYNDICATE.—The Tioga ledge is yielding some very good ore—better than has been encountered in the mine for many months. The mill is kept running 12 hours a day, and the bullion shipment will be over $10,000. The Syndicate mill was erected 18 years ago, and it has crushed a great deal of rich ore, but the present run has been the most successful. The recent development in the mine is proving to be valuable.

STANDARD CON.—During the past week there was extracted from the mine and shipped to the mill 1,433 tons of ore. There was shipped to the company $37,092.31.

BODIE CON.—During the week ending the 30th there were 161 73 tons of ore sent to the mill, and 108.986 tons were crushed. The average value of the ore worked was $32.37 per ton; that of the tailings was $9.65. The bullion shipment was $9,468.

NEVADA.

THE FORTUNA MINE.—Grass Valley *Union*, Sept. 28: The owners of the Fortuna mine, which is situated near Nevada City, have in contemplation arrangements for sinking the shaft from 100 to 200 ft deeper and opening up a new level. The owners are all Eastern men, and some of them members of Congress. The hoisting and pumping works are in good condition, as is also the shaft, which is down 210 ft. In sinking the shaft good ore was obtained, which yielded over $35 to the ton, but, in drifting at the depth of 200 ft, the ledge did not hold out, although the walls were regular and ledge matter was found between them. The opinion of experienced miners is that if the shaft is sunk from 100 to 200 ft deeper the ledge will be found to "make" between the walls, and, from the character of the ore found when sinking the shaft, it will prove to contain good pay rock.

PLUMAS.

NEW LEDGE.—*National*, Oct. 3: Blough & Harvey have opened a fine ledge about 8 miles southeast of Taylorville, and about half a mile from the one which they discovered some time ago. The new discovery is 4 ft in width and beautifully defined. They have got down to a depth of 60 ft, and the rock shows free gold and prospects very richly. It is a good showing, and the owners are certain that they have a bonanza.

SHASTA.

CUSTOM MILL.—Shasta *Courier*, Sept. 30: The shipment of Iron Mountain ore from here to Copper City, newly awakens the idea of establishing a custom mill here. There are springs within the town limits that run each from 12 to 20 gallons of water per minute, and fuel is abundant.

SIERRA.

ARASTRA.—*Mountain Messenger*, Sept. 30: Jerome York thinks of putting an arastra upon his quartz mine in Slug canyon. If he had a mill there, from what we know of the rock, we are assured that a fine property could be developed.

Two of the most promising and extensive gravel claims in northern Sierra are the Bunker Hill Con., near Newark. The tunnel is in over 500 ft on hard rock, adjoining the North America on the Plumas side. Pay is expected 250 ft ahead, and may be reached in a year. The Pilot Peak contains 300 acres of good mining ground. On nearly all sides of it gold has been abundant. The location adjoins Jas. Denoon's rich diggings. D. Boland, of Newark, is secretary for both companies.

RAINBOW.—Nevada *Transcript*, Sept. 30: J. F. Parsons, of this city, who has charge of the new 10-stamp mill at the Rainbow mine, near Alleghany, Sierra county, is in town, and gave the *Transcript* some interesting items concerning that remarkable property. There is on the dump about 3,000 tons of ore that is expected to average $100 to the ton. The result of the first week's run (with 5 stamps) after the mill started recently was $4 000. In 12 days, with 5 stamps going half of the time and all of them the rest, $12,500 was cleaned up. The motive power for the mill is derived from a Pelton wheel, which gives the most perfect satisfaction. Mr. Parsons says that, in his opinion, the Pelton is the best wheel ever invented, requiring less water than any other to produce a given power. The present workings of the Rainbow are 400 ft deep, and a tunnel is now being run to tap the ledge at a point 240 ft still lower. When this is completed the mine will be worked through it, dispensing with the steam-hoisting machinery now used. This ledge was discovered over 20 years ago by some parties who struck it while running for gravel, and took out $30,000 in a short time. The owners fell out among themselves, and work was not resumed till about 3 years ago, when Wm. Hanley (one of the original owners), S. C. Farnham, of Vallejo, and others commenced hunting for the ledge. They spent several months and many thousand dollars before striking anything, but a year ago last July they found a bonanza and took out $30,000 in two or three days. Since then they

have realized over $70,000 more, crushing the rich specimens in a hand mortar. The addition of the mill to the plant will greatly increase the regular output.

SISKIYOU.

CENTENNIAL.—Jacksonville *Times*, Sept. 30: The Centennial Co., who are engaged in mining the bed of the Klamath river, Siskiyou county, took out 40 ounces of gold one day recently. As a general thing, these river mines are not paying as well as usual this season, however.

NEVADA.

WASHOE DISTRICT.

CON VIRGINIA.—*Enterprise*, Oct. 1: On the 2000 level are repairing and cutting a drain.

UTAH.—Timbering and repairing the incline below the 1550 level.

SIERRA NEVADA.—On the 2700 level the north lateral drift has been extended 30 ft and the south lateral drift 23 ft.

NEVADA.—On the 2700 level have completed cutting out drain and timbering up.

OPHIR.—During the past week 35 tons of ore were extracted from the croppings, and 80 tons and 630 lbs of ore were sent to the mill.

CHOLLAR.—During the past 7 days 80 ft have been added to the length of the Chollar drift west from the 2600 station of the Chollar-Norcross-Savage shaft, making the total distance from the shaft 300 ft. Of material passed through, the first 40 ft were porphyry, and the last 40 ft were driven through a very hard greenstone. A portion of the time about 5 inches of water came in at the face of the drift. To-day the face of the drift is without water and the rock is getting softer. Up to this writing, the indications are that the drift will be completed through the ledge to the west country without the necessity of making use of the diamond drill.

YELLOW JACKET.—At the Winters shaft the north lateral drift on the Sagebrush level has been extended 27 ft in ground containing much clay and foul air, which has retarded work in the same. Are preparing a blower and pipe to improve the air. We are extracting about 20 tons of ore daily from the second, third, fifth and sixth levels. We caused shipping ore, owing to the low stage of the Carson river. We will ship to-day 4 bars, returns from 571 tons of ore; value of same, $14,003.40.

BALD MOUNTAIN DISTRICT.

SPECIMENS.—Eureka *Sentinel*, Sept. 30: Donald Fraser, who returned from a prospecting trip to Bald Mountain Thursday, brought in with him some specimens of gold quartz, which he has assayed and finds that they run into the thousands. He is a thorough miner, and thinks that the Bald Mountain district is one of the finest regions in the country for prospectors. In addition to the gold rock carrying silver in small quantities, in which the district abounds, he says it has the look of a rich copper-bearing region. The hills are covered with mahogany timber, there being an abundance of trees which would yield from 2 to 2½ and 3 cords of wood. He thinks, also, that plenty of water can be had by tunneling.

BERNICE DISTRICT.

BONURO.—Austin *Reveille*, Sept. 30: Col. S. C. Fogus, of San Francisco, in the interest of several other well-known mining magnates of that city—Lent, the Cooks, and others—has the principal ledges of Bernice district bonded, and as soon as the most favorable location can be decided upon, proposes erecting a first-class mill there. He has a large number of men now at work developing the mines he has bonded, and the future of Bernice looks very promising.

COLUMBUS DISTRICT.

NORTHERN BELLE.—*True Fissure* Sept. 30: The main drift on the fifth shaft level has been advanced 21 ft during the week. It is now in very favorable looking ground, the formation being decomposed quartz carrying heavy iron sulphurets. Crosscut No. 1, on the same level, has been extended 15 ft, its total length being 113 ft. A distance of 11 ft has been made in the crosscut from the main drift, on the third shaft level, the ground being favorable for more rapid progress hereafter. The total length of this crosscut is 63 ft. The amount of bullion shipped to the 28th inst. was valued at $50 053.78. This includes $16 343 for the week ending on that date, and there yet remains another shipment to be made on this month's account.

MOUNT DIABLO.—The south crosscut from winze No. 1 is in 70 ft, while the east drift from the same winze is 50 ft long, and the formation is hard. The east drift from winze No. 4 is 33 ft in length, and shows seams of chloride ore giving good assays. The winze near the bottom of winze No. 2 is down 16 ft, and has been showing about 1 ft of $55 ore. The ore in the winze from the east drift on the second level does not seem to go down very well, and the ore is being followed to the east, and now shows 1 ft of $55 ore in the face of the drift.

ORN. JACKSON.—The east drift from the whim shaft has been driven 10 ft during the week, and shows a strong bunch of manganese ore that looks encouraging.

COLUMBUS CON.—The connection between shafts Nos. 1 and 2 has been made. It tapped shaft No. 2 at a depth of 110 ft from the surface. Active operations are now in progress toward the commencemeut of sinking on the ore body cut through two weeks since.

EUREKA DISTRICT.

HYDRAULIC MACHINERY.—Ruby Hill *News*, Sept. 27: The new pumping machinery at the Locan shaft was started up during the early part of the week, and has been in successful operation ever since. There is not a shadow of a doubt now that the system is an eminent success, and the smoothness and ease with which every portion of the ponderous machinery operates is indeed wonderful. Men are now at work in the shaft, and the sinking will no doubt proceed uninterruptedly. The portions of the big hydraulic hoisting engine sent below for remodeling are now on the road, and it, too, will be running very shortly.

LEWIS DISTRICT.

BETTY O'NEAL MINE.—*Herald*, Sept. 27: South drift, lower level, has been extended 12 ft during the week, showing a strong ledge averaging well in mineral. North drift, lower level, extended 10 ft. Ground in face of drift changed to black ground, dipping to the north, in which a flow of water has been struck that for a time threatened to flood the mine, taxing for a while the full capacity of the pumps and bailing tank. However, the water is now under control, and will soon be out, when operations will be resumed on the lower level. Stopes in upper level continue to yield the usual quantity of ore. The mill was shut down the best part of last week for necessary repairs. Six bars of bullion have been shipped, valued at $5,451.67.

SANTA FE DISTRICT.

PROMISING.—Parties who arrived last Monday from Santa Fe mining district, on the line of the Carson and Colorado railroad, informed a Reno *Gazette* reporter that a number of very promising mines are being opened there. E. B. Burdick, who was the godfather to Tioga district, has cut a vein 35 ft wide, that has 4 ft of ore worth $100 to $400 per ton, upon which work is being done systematically by men of means. The only drawback is that neither wood or water is at hand, these having to be hauled from a distance.

TUSCARORA DISTRICT.

TUSCARORA BULLION.—*Silver State*, Sept. 30: The Navajo mine, at Tuscarora, continues to swell the bullion product of the State. Yesterday Wells, Fargo & Co.'s Express took west from that mine 8 bars of bullion, valued at $16,025.

WARD DISTRICT.

RENEWED LIFE.—Ward *Reflex*, Sept. 27: Supt. Sweetapple received instructions from the Directors of the Martin White mining company Thursday, to start up the mill as soon as it is possible to place it in good running order. This is exceptionally good news for this camp, if the amount of ore extracted and in sight will justify the move. A stamp has not been dropped in the district since November, 1879, but since that time the prospecting that has been done stands almost without a parallel.

ALASKA.

THE JUNEAU CAMP.—Cor S. F. *Bulletin*, Oct. 3: W. H. Robertson is superintending the cutting of a tunnel through the Juneau ledge and another for the North Star company. The latter, from a point on the Montana first, is to pass through the California first to and strike the Pilz first about 400 ft below the surface. The whole work, however, will be somewhat retarded, owing to the lateness of the season.

ITEMS.—The work on Fuller's ledge has been suspended owing to a lack of funds to prosecute the work.....The Webster mill of 5 stamps, erected three-quarters of a mile above Snowslide gulch, on Gold creek, is very nearly completed, and will be running in a week from now, and crushing ore from the Jamestown lode. From the opening of this lode, high up on the mountain side, a chute has been completed, 400 ft in length, joining a tramway 800 ft in length, along the mountain side to a point directly above the mill, where the cars will dump into another chute of 225 ft, direct into the mill. Chute and tramway are all completed, and the cars are standing on the tracks. A big pile of ore is on the dump of the mine, and we are only waiting the completion of the mill for active operations. An additional set of 5 stamps is to be added to the mill immediately. The mill is an excellent one, substantially built, and when the additional 5 stamps are put up, it is calculated to crush 25 tons of ore per day at very small expense.....The placer mines are still panning out well, but no other fields have been discovered since our last communication.....The health of the camp is good, and everyone is hopeful in regard to developments.....Jack Williams' claim is still paying well, according to last reports. Twelve thousand dollars' worth of gold were shipped per steamer *Dakota* in August.

ARIZONA.

GROOM CREEK.—Prescott *Courier*, Sept. 27: Groom Creek district, 6 miles south of Prescott, has a small quartz mill, which is running and taking out considerable gold. Mr. Merrington and others talk of building a town there. A store will soon be equipped.

CHERRY CREEK.—Mr. F. W. Blake and John J. Gosper, ex-Secretary of the Territory, arrived home yesterday from Cherry Creek district. They found Elder & Co., recently from Ohio, sinking on the Congar mine. Their shaft was down 60 ft. The rock carries free gold in paying quantities.....The Gold Ring and other mines are yielding splendid ore. We hear that Mr. Blake is well pleased with what he saw and examined.

MINERAL CREEK.—Pinal *Drill*, Sept. 30: William Schoeneberg was in from his camp, at Mineral Creek, with some splendid specimens of ore. He had a chunk of silver, which he had melted out of the rock, at his blacksmith forge, and some large pieces of pure copper, taken right out of his Poorman mine. His silver mine is the Mineral, and from all accounts they are both marvels of wealth. He says he has no partners and wants none. Mr. Schoeneberg's perseverance and energy as a prospector will soon meet with a well-deserved reward.

TOMBSTONE.—*Epitaph*, Sept. 28: There have been no new developments of more than ordinary consequence, but work has been carried on with the usual steadiness. Development work in the smaller mines is being vigorously prosecuted, and it is a safe assertion to say that there is more work going on now than ever before. The western portion of the district holds its own well, and promises to rival Contention Hill at no distant day. The great producing mines yield about the usual amount of ore, which is being converted into bullion as fast as busy stamps can crush it.

CONTENTION.—Everything is running along as usual, without much change since our last report. The crosscut on the 600 level is making good progress, and the developments are cheering in the extreme. The ore body on the 212 level improves daily, and there no longer remains a doubt that a large ore body lies in that vicinity. There is an immense amount of ore in sight in the mine, more, in fact, than the mill has power to crush in two years.

HEAD CENTER.—Still taking out ore between the first and third levels. Quality of the ore steadily improving, and promising much better for the future. Still at work straightening and improving the shaft.

GRAND CENTRAL.—Have commenced work on the south end of the claim, and are drifting from the bottom of the shaft on the Grand Central lode for the Naumkeag ledge, where there is a large showing of good ore. This portion of their ground has never been touched, other than the original prospect work. The stopes continue to yield well. They have a large block of ground on the north end of their mine, next to the Contention line, above the 400 level, that has never been touched. The great bonanza on the 212 level of the Contention is making strong toward this unexplored region, and there is every probability that it will prove itself quite as good in Grand Central as in Contention.

INGERSOLL.—No new works have been started, and things are running along about as usual. The usual amount of ore is being raised to the surface daily. All the drifts are looking well, and the stope on the 80 level is much improved. Negotiations are in progress for the erection of steam hoisting works, and it is more than probable that the shrill blasts of the steam whistle will be heard in a few days.

STONEWALL.—The works are all in excellent condition and producing the usual amount of ore. In consequence of the large quantity of ore ahead of the mill, only one load a day has been shipped for some time back. The new double compartment shaft has now attained a depth of 45 ft, and is still in hard lime rock. It is expected that the new shaft will not strike the ledge for 200 ft.

COLORADO.

THE CORRY CITY BONANZA.—Georgetown *Courier*, Sept. 28: Several weeks ago we mentioned that arrangements had been made between the Diamond Tunnel G. & S. M. Co. and Mr. Frank R. Carpenter, whereby the former leased the Corry City lode to a depth of 300 ft below the present surface workings. Mr. Carpenter commenced work on Monday, the 18th, with a force of four men. A crosscut had been driven 130 ft, showing the lode to be 39½ ft wide from the south wall to the porphyry dyke. Mr. Carpenter started a drift east from this crosscut, and has found a body of concentrating ore with native silver in the crevice rock, fully 7 ft in width, which, as it comes from the mine, is calculated to be worth, assay value, somewhere from $25 to $50 per ton. Last week four men, at drifting, took out 50 tons of ore. This week 100 tons will be shipped to Stephens' concentrating mill, at Lawson, for the purpose of testing it, and it is also the intention of Mr. Carpenter to send 100 tons to the Mansfield mill at Dumont.

CASCADE.—In our last issue was a notice of the Financier lode, on Ute creek, Cascade district, stating that the shaft had been sunk to a depth of 10 ft, and that a vein of crevice rock, impregnated with native silver, had been struck, which, in going the 16 ft, had yielded 100 sacks of ore, which had been sent to Golden. On Thursday, after the paper was issued, we received the returns from the smelter, showing that the ore weighed 5,500 lbs., and netted $1,500. The first 6 ft of the shaft was sunk through slide, consequently the ore was taken from the last 10 ft, which yielded at the rate of $150 per foot, the ore netting $545 per ton.

THE HARDSCRABBLE.—From Mr. Pinckard we learn that the work of laying 200 ft of new track in the tunnel that is being pushed for the Hardscrabble lode, Hanna mountain, has been completed, and everything now is in good condition for the prosecution of the work. The contractors are liable to intersect the lode on almost any day from this forward.

LITTLE EMMA.—The tunnel to the Little Emma mine, Democrat mountain, is now in 1,100 ft, and has about 300 ft farther to go to reach the line of the main shaft. The ore output continues about as it has for many months past. It will be increased considerably after work through the new tunnel is commenced.

IDAHO.

THE VISHNU AND IDAHO.—Wood River *Times*, Sept. 29: General John B. Winters will leave to-morrow, or the following day, for Rocky Bar, to take charge of the Vishnu and Idaho mines and mill, which he bonded during his recent trip to the old county seat. The bond is to continue for one year, General Winters obligating himself to work the mine and mill to the meantime, and having the privilege of purchasing any time. It will, in all probability, be a sale, as $5,000 was paid down upon signing the papers. The Vishnu and Idaho are two of the best mines in Idaho, and are owned by H. F. Suttle and Jacob Reeser. The veins are narrow, not averaging over 4 ft, but the ore is free milling, carries an average of $65 in gold per ton, and the aggregate yield of the 2 mines up to the present time must be all of $500,000. They have not been systematically worked heretofore, however, as the owners generally leased them to poor miners, who only worked them in a small way, and simply "gouged" them. The greatest depth attained is 250 ft.

KETCHUM SMELTERS.—*Keystone*, Sept. 24: Ore from Vienna, the Saw kies, East Fork of Salmon, North Fork, Lake creek, Warm Spring creek, Elkhorn, East Fork, Deer creek, Bullion, Bailey, Bellevue, and other points, finds its most convenient market to be the Philadelphia smeltere, here at Ketchum, and it is a fact that ore is at present coming, through regular shipments, from every one of these points to the works named. There is no location on Wood river so central, so well supplied with every natural advantage, hence so well adapted to a great smelting center as Ketchum. In consequence of this, Ketchum is not only destined to be the great ore and bullion depot of the Wood River region, but it is at the present time the possessor of the only successfully working smelter in the country. Despite the blow and flourish of her cotemporary towns, Ketchum is the recipient and manipulator of most all the country's mineral productions. Accepting the present influx of ore as the criterion, the completion of the railroad to this place will necessitate an extensive enlargement of the smelting capacity of the works here. And this will, undoubtedly, be forthcoming, for the Philadelphia company propose to add 4 more furnaces to their plant as soon as the demand will justify.

VERY RICH STRIKE.—Vienna *Reporter*, Sept. 27: During the year of 1865, while Atlanta was a young camp and everyone prospecting for the rich ledges of that section, an excitement broke out on Ross Fork creek by parties finding rich float going up into the thousands in silver. Tuenels were run in every direction, but few ledges were found, and none carrying the high-grade silver ore that they were looking for. At last it was given up. This summer, Rudolph Buhren, foreman of the Buffalo mine, of Atlanta, was walking and looking around the mountain to see what he could find, and all at once he tumbled onto the ledge, picked some of the ore up and took it to town and had an assay made of it. It went $17,960 per ton, carrying a large percentage of gold. The new strike is situated about 3 miles south from the Atlanta ledge, on the right-hand fork of Ross creek, on Clorendo hill.

THE VIENNA MILL.—Capt. Owens is pushing things ahead as rapidly as possible on the mill, and informs us that he will, unless some unforseen accident happens, have it crushing by the middle of November. The ore house is capable of holding 1,500 tons. It has 3 compartments, one for first-class, one for second-class ore and the other for salt. The outside work of the flues from the roasters and dry kiln have been completed, with the exception of a little work on the latter. The roasters are in place and the machinists are riveting them together. The dry kiln is in place, and the carpenters have the frame-work for the batteries nearly completed, and the ore bin is framed and ready to put up. The boilers are in place, being bricked up, and stonemasons are busy on the foundation for the engine. The building, which is completed, is the finest in Idaho Territory, large and commodious. It is well lighted, having 75 full and 24 half windows. In a week or two more the timbers will all be put in place, the engine, pans and settlers set up.

MONTANA.

GLOSTER MINE.—Helena *Independent*, Sept. 30: The best 12½ days run of the 80 stamps of the Boston & Montana company's Gloster mine netted a gold brick, worth $13,342. The vein is so wide in the Gloster as to necessitate retimbering in places where the country rock was not entirely firm; and it was determined to stope out all the ore from the 115 level for a distance of 250 ft along the vein, and fill in with surface attle and make a permanent roof for the mine. The recent run came from this locality, where the pay is poorest. Assorting is impracticable in this mine, and the whole product went under the stamps, notwithstanding much of it was low grade. The company is adding to the 60-stamp mill two 16-ft diameter arastra tubs, which will receive and grind all the tailings; thence, by hydraulic pressure, they will be forced through an immense mercury bath, in which it is expected a very large percentage of the precious metals will be amalgamated.

GREGORY CON.—This company is hoisting from 40 to 47 tons of ore out of the mine every 24 hours, enough to keep the entire works running in full blast. By the 10th proximo, when the furnace will start up for a long run, there will be at least 1,000 tons of ore in the bins as a reserve, in case anything should happen to the hoist, so as to interfere with the usual daily output.

THE RUSSELL GROUP.—This group of mines, on Red mountain, now under the control of the Lee Mountain Syndicate, have been examined recently and measurements taken as the basis of a report to the officers in New York.

CATO.—James Gloster, the discoverer of the famous Gloster lead, has recently discovered, at the head of Wsshoe gulch, a tributary of Bear gulch, a gold lead, which he has named the Cato. It lies transversely along the backbone of the divide between Bear and Elk gulches, which both paid richly as placer ground and still yield a large revenue.

KEO MOUNTAIN.—Robert Whipple has recently made several locations on the south side of Red Mountain, some of which give promise of becoming mines with a reasonable amount of development.

SILVER CREEK.—Dobbins & Burke's arastra, on Silver creek, has started up on ores from the Keystone and others of their mines on the black butte, about 5 miles north of the city. Within a few days a clean-up will be made, when a determination of value may be had. Their rock pans well and the indications in the arastra are thus far satisfactory.....In the same vicinity Mr. Cullison has a location called the Queen of the West, from which he has taken copper-stained ore that assays well, and two other claims of his are quite promising. The veins in that vicinity are regular, and there is little doubt that somewhere in that butte is a vast deposit of rich ore, which, it is hoped, these parties now working there may bring to the light.

NEW MEXICO.

GOLD.—New Mexico *Mining News*, Sept. 27: For the past few days the people of El Paso have been considerably excited over the report of a rich gold discovery in the Organ mountains. Heretofore, that district has been looked upon as a silver and copper district, almost exclusively. No one has ever thought it would prove to be rich in gold, although indications of gold have been frequently remarked by old prospectors; but, up to last Saturday, no rich gold ore has ever been found in the district. Now, however, it transpires that there is richer gold quartz there than anywhere else in the whole west. About a month ago L. W. Lenoir, of Las Cruces, and Pat Breen, of Organ, located two claims upon an apparently very rich outcropping of copper ore. One of these claims, that of Lenoir, was christened the Copper Duke. While working for copper, very much to the surprise of the owners and workmen, a shot put into the shaft at a depth of 7 ft threw out a large quantity of decomposed honeycomb quartz, which was literally matted with free gold. The quartz is a half-decomposed honey-comb, containing oxide of iron, black sulphurets of silver and 35% of copper. The vein is 7 ft wide, and the gold-bearing portion of it 3 ft. The lode is situated on the east side of the Organs, about 6 miles northeast of San Augustin pass. It was discovered August 3d, and is claimed to be a contact vein between limestone and granite walls. The gold was struck September 2d:

PLACERS.—Great excitement prevails over the gold discovery, by Mr. Walker, near San Doral ranch, about 25 miles from Wallace. It is placer diggings, and Walker has struck it rich. He has plenty of water and has begun sluicing. The gold is coarse, and is to be found everywhere in the neighborhood. Parties from here who have visited the spot report it one of the best placers in the Territory.

BURRO MOUNTAINS MINING ITEMS.—*New Southwest*, Sept. 28: The Mary tunnel is now within a few feet of the main ledge, and, as soon as cut, a drift will be started on the vein, following which great depth will be gained. The surface ore on this mine is a good quality and easily smelted.....The Queen City furnaces have raised steam and will be rolling out copper by Monday. This will make things lively at Oak Grove. They commenced hauling in ore and flux this week, and have a large lot of wood and other supplies to last several months.....The Burro Chief mine is showing up splendidly—producing fine ore and the best flux or spar for flux for the smelters that has ever been found in the country, and selling the same to surrounding smelters at $10 per ton, whereas they were paying $25 per ton for an inferior article before.....The Clarita silver mine shaft has widened out to 13 ft, and all good free-milling ore, which averages 40 ounces silver, except about 2 ft pay streak, which runs from 100 to 500 ounces silver.....The Valverde Co. is raising 2 to 5 tons of fine copper ore daily from their Pittsburg shaft. The St. Louis, No. 2, still produces fine iron running well in copper.....The Valverde furnaces are in full blast again. The company ship this week 28,000 lbs of fine blister copper to Pope, Colo & Co., Baltimore. The St. Louis mine is producing double the usual quantity of ore.

HANOVER.—A contract has been let to sink 500 ft on the White mine, in the Hanover district.....We are informed that $18,000 worth of float has already been taken from Sheddon's new discovery on the Percha.....Mr. Shodd paid this week the money for several claims in the Bullard Peak district, on which the bonds had run out.....The Mount Adams and Vesuvius mines, in the Burro mountains, belonging to L. A. Seyder, are showing large bodies of high-grade mineral, and, when developed, will be fine properties.....We hear that W. J. Crosby, Thos. Dunn and A. Green have sold the Gallatin mine, in the Virginia district, to the Lockport Co. for $25,000.....The Mountain Boy mine, in the Burro mountains, now being worked by Nawrath & Byrnes, was, it is claimed, located last year by Johnson, Goldsmith and Weisl, and, consequently, the men who jumped it have no right to the property.....In Bremen's "76" mine a very rich body of silver ore has been discovered containing chlorides, sulphurets and horn silver, that averages, in the mill run, over 2,100 ounces to the ton. The value of this strike will be realized when it is known that from 50 to 100 tons of ore can be taken out in 24 hours.

OREGON.

NOTES.—Jacksonville *Times*, Sept. 29: Miners are getting ready for the rainy season.....Jacob and Lannes Klipped and W. S. Brodbeck are mining at Dividend har with fair success. W. Prefontaine has returned from the railroad and commenced preparing his claim for winter. He will put down a large amount of flumning.....J. W. Ingram, of Willow Springs, the other day, picked up a nugget worth $25 in the claim he is interested in with R. H. Dean. He is at present engaged in drifting.....De Lamatter & Co., who have extensive interests near Kerbyville, have completed the eulargement and extension of their ditch, and will operate on a larger scale than ever next season.....The Sterling mining company having finished cleaning up for this season, Frank Ennis left for Portland this week for a short business visit. There is not a doubt but what many thousand dollars were taken out of this claim during the past season.....N. O. Mitchell has returned to Portland, and Mr. Welch has come to put up the quartz mill at Ackwell, the huge engine of which arrived this week, as also most of the paraphernalia. It is expected that the mill will be in running order before rainy weather sets in..... The Josephine mine, located in Slate Creek precinct, was sold at Master's sale at Kerbyville last Monday, and bought by Wm. Bybes for the sum of $3,740, the amount of his judgment, and the costs of the suit, etc. This property will be put in first-class order at once.

UTAH.

SILVER REEF.—*Miner*, Sept. 24: The Barbee & Walker mine is looking good, with a new development at the 500 level of fine body of ore. The new engine has proven a perfect success. For some time past this company has only run their mill during daytime and hoisting ore accordingly, but intend running full capacity about the 1st prox., when a large output may be expected.

CHRISTY.—The regular shipments of ore from this company's mines to their 5-stamp mill are being kept up, and at no time has the property been in a better condition than at present. A large amount of good ore is being hoisted daily and underground developments are constantly going on, which reflects much credit upon the management.

STORMONT.—Owing to recent floods, which carried away the flume at the mill, the crushing of ore is necessarily stopped for a short time, but will be running full capacity in a few days. Timbers and other materials are on the way here, and by Monday next the carpenters will commence repairs. Ore shipments of this valuable property are being continued, and the condition of the mine is really flattering.

CAVE.—Southern Utah *Miner*, Sept. 20: An old and well-informed Star miner says the Cave mine, in Bradshaw district, is now one of the best mines in Beaver county. It shows a perfectly defined north and south vein dipping to the east. The average thickness of the ore is about 5 ft. From present development I could not tell the length of the ore chute, but enough is exposed to satisfy the wildest dream of a miner. One of the most remarkable caves in this mine is one christened, by Mr. Bigelow, Cascade cave. It is about 40 ft long and 20 ft wide, with numberless stalactites pendant from the hanging wall, and stalagmites from the footwall, and in many cases columns of varying thickness below. The white spar resembles a cataract suddenly frozen. Underlying this cave is a solid mass of ore, going high in gold and silver. The Cave Extension, owned by the same company (the F. M. & S.), lies southeast of the Cave mine and a good deal higher on the mountain. They are now extracting high-grade ore from a chamber as big as a meeting house, with caves and chimneys of ore running in every direction. This mine is remarkable for the absence of surface indications, as, in many places, it only shows iron stain, and at the main outcrop is only a pipe of iron ore 3 or 4 ft in diameter. A prospector would hesitate before expending much money on the surface indications, as the country rock is extremely hard, it being blue limestone and very crystalline.

A MINER HAS AN EYE BLOWN OUT.—At an early hour Tuesday morning, Wm. Turner, while taking up bottom on the 13th level of the Idaho mine, struck his pick into an old drill-hole, which contained a charge of powder which had not been shot off, and the result was that an explosion took place, which threw pieces of rock into his face, cutting it in a fearful manner, completely destroying one eye, and probably the other, although Dr. Jones, the attending surgeon, says that there is a hare possibility that one eye may be saved. It is snpposed that the pick struck the cap on a tonite cartridge and caused the explosion, as tonite will not explode without the concussion of the cap which is used with it. The accident is a very distressing one to a worthy and industrious man, who has the sympathy of many friends in his great misfortune.—*Grass Valley Union.*

Recent Contributions to the California State Mining Bureau.

[Furnished for publication in the MINING AND SCIENTIFIC PRESS by HENRY G. HANKS, State Mineralogist.]

[CATALOGUE.]

4217. Ancient Relic—Found at Gridley, Butte county, Cal. J. A. Manter. The following description is from the Gridley *Herald* of August 24, 1882:

ANCIENT RELIC.—While playing in the timber in the northern part of town, Monday, one of J. A. Manter's little boys found the rifled barrel of a pistol. It is four inches in length, thicker than the barrel of a Winchester, and is blackened with rust. The bore is about a 44. The tube is all right, and with a new stock the weapon would be ready for use. At the breech, by the side of the nipple, is a small gold plate. Viewed through a watchmaker's eye-glass can be plainly seen engraved on this plate the letters "H. McG." Believing that the weapon had a history, a *Herald* reporter began investigating, and has ascertained the following from old timers, who speak from information obtained in the early days: In the fall of 1839, a party of Mexicans passed northward through this valley, en route to a grant presumed to be in the neighborhood of where Chico is now located. The train belonged to a wealthy Mexican named Lopezada. Himself and family were with the outfit. He had a daughter about 16 years of age. She is represented to have been the embodiment of the grace and beauty peculiar to the Castilian race. Among the attaches of the caravan were one American named Thomas Lansing, hailing from Vermont, and a Scotchman named Harvey McGruigan. The latter was secretary to the Don and "messed" with the family. Lansing was the wagon boss. Both men had lived several years in Mexico and spoke the language fluently. Each became smitten with the girl, she favored McGruigan. Lansing was a fiery tempered man and sought a row with his successful rival upon every opportunity. Matters progressed thus until this locality was reached, when Lansing insulted McGruigan in such a manner that the latter yielded to passion and challenged him to fight a duel. The two men repaired to the grove of timber then occupying our town site and settled their difficulties. Three shots were fired by each. In the third round McGruigan fell with a bullet in his brain. Lansing received a shot in the left arm and had the lobe of one of his ears cut away. As he turned to leave the scene, the girl, who had followed them from the camp, stepped out from behind a tree and stabbed him in the neck with a stiletto, severing the jugular and producing death almost instantly. The pistol found Monday is thought to be the identical one used by McGruigan. Its appearance and characterizing features go to establish the truth of that presumption.

4218. Tridacna gigas—South Sea islands. Presented by J. C. Davis. The generic name, *tridacna*, is from two Greek words—*tri*, three, and *dakno*, to bite. The name seems to be derived from a passage in the 32d book of Pliny's "Natural History," Chapter XXI, in which is mentioned that the expedition of Alexander revealed the fact that oysters were found in the Indian sea which were a foot in diameter, and that certain gourmands had given to large oysters the whimsical name of *tridacna*, adding to their zest by the jest, inferring that it required three bites to eat them. The specific name, *gigas*, is Latin for giant. In Cook's "Voyages," cockles are mentioned as being found in the Pacific which two men were not able to carry. Capt. Cook also states that the animal of this species sometimes weighs 20 lbs., and is good eating. Darwin also mentions gigantic bivalves seen in the lagoon at Keeling, or Cocos island, but he classes the shell as the *chama*. A pair of the valves of the *tridacna gigas* are used in the Church of St. Sulpice, Paris, as *benitiers* or holy-water fonts. They weigh upward of 500 lbs. and are two feet across, probably about the size of Mr. Davis' donation. They were sent to Francis I by the republic of Venice. They are objects of special interest in the magnificent church, and are highly prized.

4219. Impressions of Leaves in the So-called "White Lava"—Two miles from San Andreas, Calaveras county, Cal. Dr. William Jones. This specimen seems to prove two facts: 1. The formation must have been soft, to admit of the leaves being imbedded; 2. The lava could not have been in an igneous state or the leaves would have been burned, and could not possibly have left their impression as seen in the specimen. The formation must have been volcanic mud which preceded the igneous flow of true lava with which it is capped.

4220. Kaolin—Seven miles southeast of the town of Grass Valley, Nevada county, Cal., section 3, township 15 north, range 9 east; deposit, 6 ft. thick; surveyed area, about 10 acres; actual area, unknown. For analysis, see report of Prof. Hilgard in the annual report of the State University for 1881. Presented by J. W. De Golia.

4221. Sample of the Clay No. 4220—Burned in a potter's kiln, which shows it to be well fitted for the manufacture of fine pottery. Burning done by Gladding, McBean & Co.

4222. Native Copper—Mammoth mine, Patagonia mountains, Pima county, Arizona. The vein is said to be four feet wide, and has sheets of metallic copper like the specimen running through the vein, parallel to the walls. The sheets are from one to four inches apart, and by careful work could be got out of almost any size. E. M. Alderman.

4223. Native Copper—With copper minerals, in a gangue of sulphate of baryta, with specimen mounted for microscopic examination. From a ledge in the southeastern corner of Trinity county, Cal. The ledge is said, by the donor, to be very prominent, and can be seen running in a straight line for 20 miles, from the south toward Mt. Shasta. William Ayres.

4224. Platinum, Iridium, Etc.—Concentrations from the Spring Valley hydraulic mine, Cherokee, Butte county, Cal. Louis Glass.

4225. Placer Gold in Cement—Spring Valley hydraulic mine, Cherokee, Butte county, Cal. Louis Glass.

4226. Portion of an Oak Tree Showing Inscription Carved and Overgrown by Solid Wood—Yosemite valley, Cal. John Kirk Barnard. This section of tree was taken some 18 ft. from the ground. Outside it showed the scar of a former "blaze," and on splitting it, discovered the following inscription—"Miss Haight., J. Welty," and a monogram of R in a D. The overgrowing wood has entirely covered the carving, growing into it and reproducing, in relief, the whole inscription with most remarkable exactness. The overgrowth shows some 13 rings, giving some idea of the time elapsing since it was carved. Any reader knowing the above parties will please communicate with the Mining Bureau with a view to ascertain the date of the carving.

Extraordinary Water-Pumping.

About two years ago the Alloa coal company resolved to resume mining operations in the old mines of Devon iron works, which are situated about midway between Alloa and Alva. Coal had been worked on a somewhat extensive scale at Devon as early as the beginning of the present century, but operations were entirely suspended somewhere about 1854. The pumping engines on the Furnace Bank and other pits were stopped, and the enormous waste extending for miles to the south and east and west of the works was allowed to fill with water. When the company came to the conclusion to pump out this water and again commence coal working in the district, the undertaking was looked upon by mining men of great experience as being one of the most gigantic which had ever been tackled in Scotland. In the month of June, 1880, the management of the concern (under Mr. Roxburgh, the general superintendent for the company) was placed in the hands of Mr. Moodie, a Fife manager, who had had a great amount of experience in pumping operations. A powerful beamed engine, similar in every way to the old-fated Hartley machine (which played so much havoc in 1862), which had been erected in 1854, on the Furnace Bank pit, by Neilson & Son, engineers, Glasgow, was soon repaired and set a-going. Other pumping engines were brought into requisition, and for some time it was computed that no less than 3,000,000 gallons of water were brought to the surface [every 24 hours. Notwithstanding the enormous growth of water arising from a very wet stratum, this rate of pumping soon began to make headway in what was nothing short of an ocean. The work had, however, been commenced little more than six months when Mr. Moodie, the manager, was by an unfortunate accident knocked from a scaffold in the shaft, and he fell into no less than 50 fathoms of water. Ere the top of the water was reached he had sunk to the bottom, and as the result, his body was not recovered until the water had been pumped out. His responsible post was pluckily accepted by his eldest son, Mr. Thomas Moodie, then of Leven colliery, Fife. Under Mr. T. Moodie's management the water continued to decrease, and by May, 1881, the bottom of the Furnace Bank pit was reached. This was certainly much sooner than was anticipated, the feat being referred to by one of Her Majesty's Inspectors of mines as being one of the most extraordinary, if ever paralleled, which had come under his notice in Scotland. After the water was pumped out it was found that the seams of coal had been a good deal worked to the rise or south. Accordingly, the Furnace Bank pit has been sunk an additional 180 ft., making the shaft in all 110 fathoms; and now a capital hold of the upper 5-ft., 9-ft. and lower 5-ft. seams has been obtained. A lease of the coal fields extending from the pits to the foot of the Ochils, and east and west for many acres, has been obtained, and with fair prices the speculation promises to be a profitable one. The seams range from 3½ ft. to 6 ft. in thickness, and are stated to be of excellent quality. The coal will be worked on the stoop-and-room system, and being chiefly "dook" workings, machinery of the very best type, pumping and winding, will be erected in the bottom of the shaft. A pair of couple winding engines, capable of raising 500 to 600 tons of coal per day of eight hours, has been placed on the bank of Furnace Bank pit. The maker of the engines was Mr. Andrews, Kilmarnock. A ton of coal is raised every load. Close to this pit No. 2 shaft has been sunk. A rarefying air fan of very large dimensions has been placed on this pit, and while it will form the upcast shaft of the colliery, coals will also be brought up by it. A winding engine, supplied by Messrs. M'Culloch & Son, Kilmarnock, similar to that at the Furnace Bank pit, has been erected. At the Crosshill pit, one of the old shafts, a new pumping engine, with a 60-ft. cylinder and 12-ft. stroke, has been fitted up. The pumps are 24 ft. in diameter, and the water is brought to the surface by two forcing and two lifting sets. Here a capital winding engine has also been erected. Both machines were supplied by Mr. Andrews, Kilmarnock. Altogether the colliery promises to be one of the largest in Scotland. The success of the undertaking is no doubt due in a great manner to the skill displayed by Mr. Roxburgh, and the manager, Mr. T. Moodie.—*Glasgow Herald.*

Utopia.

An Attractive and Prosperous Mining Camp.

On Birch creek, Beaverhead county, Montana, six miles from Apex station, on the Utah & Northern railroad, 10 miles from Glen station, on the same railroad, and 20 miles from Dillon, is Utopia district. Two and one-half miles up Birch Creek canyon is a valuable iron mine, the vast extent of which has not yet been discovered. There seems to be a whole mountain of ore, which is magnetic, and said to contain 80% of pure iron. Germansen & Wells are the owners. They have delivered 200 tons to the Hecla company, of Glendale, this season, and the ore is so rich that it must be mixed with the Soap Gulch ore before it can be used for fluxing. Nearly opposite, on the other side of the creek, are valuable copper mines. A shaft of 40 ft. has been sunk, showing a vein four feet wide from the surface. The ore has assayed 80% of pure copper, besides 20% of silver, with a small percentage of gold, and has brought $35 per ton at the smelter in Glendale. Farlin Bros., of Butte, are the owners.

Two miles above the iron mine is the silver mine of John Mullarky. An open cut of 30 ft. in length exposes a crevice 20 ft. in hight. Dudley & Goodrich are prospecting another discovery of silver directly above. The ore is found in pockets, in limestone formation; yet there is a well-defined crevice 27 ft. from the surface. This ore has assayed 355 ounces of silver, $80 in gold and 55% of lead to the ton. Wallace & Co. are the owners, and they propose to sink a shaft 50 ft. and run a crosscut to the footwall.

The Red Bear mine, one-third of a mile farther north, is owned by the Railway Mail mining company. An open cut 25 ft. long and 20 ft. deep, with a crevice two feet in width, is the showing, and upwards of 400 ounces of silver, worth $50 to the ton, have been obtained by fire assays. Mining experts from Utah pronounce this a promising mine, and have offered $5,000 for it.

One thousand feet north are the Alaska and Eureka mines, owned by Germansen & Wells. The Eureka shows a shaft 30 ft. deep and a tunnel 50 ft. long, striking the mine at a depth of 20 ft. Assays of 1,500 ounces to the ton have been obtained.

There is an abundance of timber and fire-proof material for furnaces for reduction of ores, and ample water power in this district, and it is accessible at all seasons of the year.—*Cor. New Northwest.*

The Forests of the Pacific Coast.

We have often alluded to the comprehensive work undertaken by the census office, with Prof. C. S. Sargent in charge, to make known the forest resources of the United States in 1880. As we have stated, the forest volume of the census will be full of tables and illustrated by colored maps of the different States, showing the forest area of each. This will be published in due time. We find that Prof. Sargent has given the public a sort of a forecast of his conclusions in a well-written article in the *North American Review* for October. It is a significant fact, showing the prominence with which agricultural and industrial subjects generally are now attaining, that almost every issue of this popular magazine contains a good review of some industrial theme. Not long ago such matters were cast aside for more acceptable discussions of literary, philosophical, political and other matters.

But to return to the forests: We shall collate from Prof. Sargent's article, which treats of the forests of the whole country, such parts as contain his conclusions on the Pacific coast forest growths. He shows that the distribution of the forests of the Pacific region clearly illustrate the influence of moisture upon forest growth. The rainfall of the northwest coast is very large, exceeding that of any other part of the continent; it gradually decreases with the latitude, and on the coast at the southern boundary of the United States is reduced to an average annual precipitation of less than 10 inches, not quite one-eighth of that received on the southern coast of Alaska. High mountain ranges, parallel with the coast, and extending from Alaska through the peninsula of Lower California, dissipate much of the moisture attracted from the Pacific ocean, leaving the whole the vast of interior region east of these mountain ranges, and lying between them and the eastern edge of the Pacific region, imperfectly supplied with water. It is a region of light, uncertain, and unequally distributed rainfall, heavier at the north, as on the coast, and decreasing gradually with the latitude, in nearly the same proportion.

The whole of the Pacific region is composed of the mass of mountain ranges and narrow valleys which form the Cordilleran system. The precipitation of moisture, both snow and rain, is, of course, heavier on the mountains than in the valleys between them, increasing, other things being equal in proportion, to their hight. In the case of the region in question, the western slopes of the mountains facing toward the ocean receive a larger precipitation of moisture than their opposite eastern ones. The forests of this region correspond with its rainfall. Along the northwest coast there is a strip of forest unequaled in density by any forest outside of the tropics; but this heavy growth does not extend east of the western slopes of the main Coast ranges. It pushes southward along the California coast, where the redwoods illustrate the maximum of forest productiveness. It decreases in density with the latitude on the slopes of the Sierras, disappearing entirely from the California Coast range south of Point Conception.

Throughout the Pacific region, the forest is confined to the mountains. The great interior ranges are forest-clad; at the north, the higher ones often heavily. At the south these mountain forests are light, often disappearing entirely from the lower ranges. In southeastern Arizona, and the adjacent parts of New Mexico, the forests, under the influence of heavier and more regularly distributed rainfall, are, however, denser than those in the same latitude farther west. But the forests of this whole region, north as well as south, are the forests of dry country. They are nowhere luxuriant as compared with the forests of the Pacific or the Atlantic coast. The trees have grown very slowly, and are often of immense age; undergrowth and seedling trees, which characterize a vigorous forest growth, are wanting, except at the extreme north, or in the canyons of some of the highest ranges. Everywhere these forests show that their struggle for existence has been a severe one. They hold the mountains, but they just hold them, and no more. The drier valleys are treeless, or nearly so.

It is not improbable, in the light of recent scientific investigations, that even so recently as the time when some of the immediate ancestors of the trees which form these forests were growing, the whole interior region, now believed to be gradually drying up, enjoyed a more abundant rain-fall than it now receives, and that these forests then originally grew under more favorable conditions than at present. If this hypothesis is correct, it will be easy to understand why, under less favorable circumstances, their reproduction will be difficult. The interior forests at the north may be expected, however, thanks to the present rainfall of that part of the country, to reproduce themselves slowly; but so slowly must this process go on, that, judging from the age of existing trees, many hundred years will have passed, if these forests are destroyed, before their successors can attain sufficient size to be of economic importance. Through all the southern part of the interior region, the struggle for life has been so severe that the stunted groups of trees, which barely deserve the name of forests, have only succeeded in finding a foothold in the high canyons about the heads of the scanty streams. The age of some of these small trees is immense. Few young trees are growing up to replace those which perish in the course of nature; and, once destroyed, the reproduction of these forests is so doubtful, or must at least be so slow, that the possibility of it, even, need not be considered in any practical discussion of the question.

Unlike the forests of the Atlantic, those of the Pacific region are composed of a few coniferous species, generally of wide distribution. Broad-leaved trees are almost entirely wanting in these forests, or, where they occur, are confined to the valleys of the coast, and to the banks of mountain streams. They nowhere form, as in the Atlantic region, an important element in the forest composition, and, economically, are of little importance.

The heavy forests of the Pacific region are still almost intact; other forests of this region, less productive, although from their position even more valuable, have already nearly disappeared. The unequaled forests of fir of the northwest coast hardly show the marks of 30 years of cutting and annually increasing fires. In this humid climate, young trees of the same valuable species spring up so quickly on land stripped of its original forest covering, and these new forests grow with such remarkable rapidity, that there is little danger of their final extinction. Any attempt to estimate even the productive capacity of this belt of forest is vain, although it is safe to assume that it contains the largest and most valuable body of coniferous timber remaining in any part of the world. The noble forests of pine and fir which grace the western slope of the California Sierras are still, so far as their mature trees are concerned, largely intact, although the increase in the number of forest fires in this region is alarming. The Sierra forests, thanks to their usually inaccessible position, have so far, for the most part, escaped the organized attacks of the lumberman. Serious, and often fatal, injury has been inflicted upon them, however, by the sheep which every summer are driven up by thousands to pasture in the cool, moist, subalpine meadows of these high mountains. The sheep, enforced by great hands of horses, cattle and goats, clean everything before them; nothing but the large trees and the most stubborn and thorny chaparral escape their voracity. Every young tree, every bud and every blade of herbage is devoured; everything green is destroyed; and the sheep tread out from the dry, gravelly hillsides the roots of all young and delicate plants.

The Sierra forest is, over most of its extent, a forest largely composed of full-grown trees, containing but few young seedlings, and little undergrowth to shelter and protect them; its condition, then, is critical, and unless measures can be taken for effectually limiting the range of browsing animals, its total extinction must be merely a question of time.

The belt of redwood forest along the California coast has already suffered severely at the hands of the lumberman, and many of its finest and most accessible trees have already been removed. A large amount of this valuable timber is still standing—less, however, than has generally been supposed; and at the present rate of consumption, the commercial importance of this forest will have disappeared at the end of a few years more. It will, however, owing to large annual precipitations of moisture received by this portion of the California coast, and the unusual vitality of the redwood tree itself, spread again through the canyons of the Coast range; but centuries must elapse before such new forests can rival in productiveness or extent those which California is now so rapidly dissipating. The forests of the northern interior region are still comparatively intact. Few demands upon them have yet been made, although extensive and destructive forest fires sweep bare every year great areas along the mountain sides. The northern forests are largely composed of the valuable species of the northwest coast, and, with proper protection, will long supply with fuel and building material the agricultural population now rapidly pushing into this part of the United States. The great pine forest which extends east from the flanks of the San Francisco mountains, in Arizona, nearly along the 35th parallel of latitude across the New Mexico boundary, has, up to the present time, escaped serious injury. Less valuable in its composition than the forests of Montana and Idaho, and yielding timber of comparatively inferior quality, this broad belt of pine is—owing to its isolated position between wide stretches of desert—of prime importance to the future development of this region. The remaining forests of the interior region, including those of the high Colorado mountains, are largely wasted. The mining industry has already made serious drains upon them, and fires are licking them up in every direction. It is hardly possible to realize the damage which has been inflicted upon these forests during the past 20 years. They are scarcely reproducing themselves anywhere, and in a few years, unless the present rate of destruction can be reduced, they will have entirely disappeared.

ELECTRICITY ON WINE.—A curious experiment, according to the Paris newspapers, has recently been made with wine in that city. A current of electricity was passed through a small cask of sour wine, and at the end of a few days the wine was found to be greatly improved in quality and to have acquired that flavor which has hitherto been supposed to come of age. It is said that the discovery of this new maturing process is owing to the accident of a thunder storm having greatly improved a cask of bad wine in the cellars of a vintner.

Reduction Works.

On our mines we bet, says the Prescott *Courier*. Out of them a great many Arizonans expect to realize fortunes. We hevs now and then picked at them for ever so meny yeare, alwaye with veiying succese, hecauee we hed not the means to develop them, or the knowledge to roh the ores of their treasores. Some of our people did know how to prospect for placer diggings and wash the gold ont of them, but thie clase of miners, like similar ooee elee-where, did not last long. We have yet hroad acree of them, bot lack of ahoodant water power stays the hands of the miners. The placer mining ceasoo ie short in Arizona, or else more gold would be taken from the gravel. Shortly after theee fects dawned upon the minds of the miners, maoy of them torned their attention to the quartz ledgee so nomerons in our county. Some of these ledgee carried "free" gold and silver in paying quantities as far ae the much-talked-of water level, whsn and where most Yavapai county oree change from "free" to base, or rather robellioue. Orce below the water level are just as rich, sometimee richer, than thoee fonnd above; but as many "hostile" metale and minerals are found in Nature'e reserve closely allied with the precious and useful metals, efforts here made to separate the good from the bad have, in most cases, been made in vain. Of late, hlast or smelting fornacee have been successfol with certain classes of ore, notably thoso of tho Silver Belt mine, in Big Bug district, and the Dosoris mine, in Hassayampa district. We hear that Prof. Shafor has met with good succese on Lynx oreek.

What, however, miners and other citizens of this and other mining sections of Arizona want, may be enmmed np in the words at the head of thie artiole, namely, "Redoction Works." We want them complete in every particnlar, so that in them all oree rich enoogh to pay for mining and working can he worked with profit. Other mining regions have snch works; then why not this section, tbe ores of whioh, it has been puhlicly acknowledged, strnok intelligent observere at Denver as being the richest ever seen by thsm. Right now miners of this section are shipping orss to Omaha and elsewhere, 100 milee by wagon and the remeinder of the distance hy rail, solely because there is not in this immense section of country proper furnaces, machinery, etc., to work ores. Having time and again descanted on the great henefits to he derived from the right kind of mining, milling, etc., in theee mountains, we leave that matter to those whose direot interest it is to work for the happy result so frequently pictured.

Six-mile Canyon.

The Omega mill is still running on tailings, but will prohably finish with all on hand hy the end of this month. The mill may he moved to Ophir Flat, above Dayton, where is an immense pile of tailings to be worked. This will he a good thing for Dayton.

Hully's water mills are hoth running, the lower one on tailings and the npper on ore from the Cosmopolitan mine. Water is somewhat scarce. The stamps are run for a certain length of time, and then hung up, when the pans are rnn till the ore crnshed hy the batteries has heen amalgamated.

A considerahle amount of ore is heiog taken out at the Lady Bryao. It comes from poiots at and near the surface of the vein. This ore is crushed at the Bossell mill. Lonkey & Smith are pntting in a oew water wheel at the old Courser mill. When the wheel is in, this mill will also start np on Lady Bryan ore.

All the water mills along the canyon, whether designed for working tailings or ore, are running. It is prohahle that much more ore than is now heing taken ont might readily he found in the minee oo the line of the Cosmopolitan, Monte Cristo, Brunswick, St. Johns and Occidental.

All these mines are situated on a very large east or front lode that can he traced southward to the old Daney and northward to a great distance. It is a trne fissure vein and may he very easily traced a distance of 10 miles. Thus far most of the work on this vein has heen at and near the surface—the work at the Occidental being the deepest.—*Virginia Enterprise.*

CRAYONS IN VITRIFIABLE COLORS.—M. Lacroix, a Parisian chemist, has introduced crayons, similar to the ordinary lead pencils, the lead being replaced hy vitrifiahle colors. The colored designe which are executed with these crayons, on slightly roughened glass, bear the heat of a mnffle, and are fixed like a painting upon glass; the grays especially give excellent results. A similar process which was tried upon porcelain some years ago was unsnccessful; prohahly hecause enameled surfaces were used. On hiscuit, it is likely that good resnlts might have heen ohtained.—*Chron. Industr.*

WOOD CARVING in New York city has increased tenfold in as many years. Fine residences huilt the last year have heen ornamented with an unusual amount of carviog, and, at the same time, people of moderate fortune indulge their tastes to a large extent in this direction. Taking the whole woodwork of an elahorately finished house, it is estimated that each sqnare foot of wood surface represents a week'e work of the carver. Large numbers of carvers have come from England, causing a reduction in wages and the expensiveness of the work.

Useful Information.

Fishing for Rats.

A novel mode of catching rats is thus described in the *American Angler*. The writer says that a person having the patience of most fishermen can have much eport in hooking the vermin.

The warshouse edjoining his place of hosioese is infested hy these "file-tails," and our friend may be seen in the early spring and late fall, on an occacional eveuing just after dusk, seated at the back window of his counting-room (overlooking the yard of the ware-house), with an ordinary rod in hand, strong linen line, and a spring hook, commonly called a "sockdolager," baited with a lomp of fresh beef, patiently waiting for a bite. It does not tarry long, nor does it coosome itself in nibhlee, but with a huogry soap the bait is seized, and the hooks of the sockdolager impales the ret, when the excitement commences.

A lusty rat is no mean antagonist at the end of a pliant pole and 10 ft. of line, and his plunges, twistings, and straight-away deshes are more perplexing to the angler, than tho leaps, surges, and snlkings of the gamy trout or bass. The rat is generally landed, after seasonahle sport, and killed hy a hlow from a hludgeoo.

In thie connectioo, we may state that thousends of small hooks are honght hy sugar refiners for ratting purposes. The hooks are haited with small pieces of beef on each, aod then distributed ahout the building. Tho rats swallow heef and hook—the first is digested, the latter is not—death, of course, results. The remedy is said to ho infallihle.

FLIES AND THE CASTOR-OIL PLANT.—Obsservations made hy M. Rafford, a memher of the Societe de Horticnlture at Limoges, show that a castor-oil plant (*Ricinus communis*) having heen placed in a room infested with flies, they disappear as hy enchantment. Wishing to asoertain the cause, he soon found nnder the castor-oil plant a nnmher of dead flies, while a large numher of hodies remained clinging to the under snrface of the leaves. It would therefore appear that the leaves of the castor-oil plant give out an essential oil, or some toxio principle which possesses strong insecticide qnalities. Castor-oil plants are, in France, very much used as ornamental plants in rooms, and they resist well variations of atmosphere and temperature. As the castor-oil plant is much grown and cultivated in all gardens, the *Journal d'Agriculture* points out that it would he worth while to try decoctions of the leaves to destroy the green flies and other insects whicb in summer are so destructive to plants and fruit trees. Tne plant is also common enough in this country, and readers can therefore test the accuracy of these French reports.

LEATHER GUNS.—During the Cuban "Patriot war" the patriots, as they were then called, devised a cnrious cannon of leather as a substitute for the metal pieces, which they were nnable to ohtain. The barrel of the gun was ahout three feet and a half long, aod made hy stretching stout, well-dressed leather, in a soaked state, upon a mold four inches in diameter, and sewing the edges with cords of the native *pita de carojo*, which has a great tenacity. When dry, anotner thickness of leather was stretched upon the first layer, and four more snhsequently added. The hreech was made of hard wood, and the chamher often lined with tin. These gune fired from 10 to 20 rounds hefore becoming unfit for use, and were usually loaded with stones, through the ahsence of grape and caonister. They did considerahle execution, and were lightly transported in pairs upon the shonlders of a msn. When used they were laid npon the ground, and pointed at short range upon an approaching column..

POSTAGE-STAMP FRAUDS.—The principal lossee to the Government appear to he, in hrief, from the following csuses: 1. Stamps are not canceled, or are so slightly defaced that they readily pass into second use and escape detection. 2. Caoceled stamps are removed from the letters, the caoceling ink washed off, the stamps regummed, and sold for re-use. 3. Uncanceled stamps are removed hy rognee in the post offices, and old canceled stamps snhstituted. This prohably is the way that a large loss is occasioned. It would seem that the inventor who can make a really serviceahle postage stamp that can he readily applied to an envelope, but which cannot he removed without the total ohliteration of the stamp, will have produced a valuahle improvement. By a serviceahle postage stsmp is meant one that will hear reasonahle handling without injury, that has no poisonous qualities, that is easily applied, and that cannot he removed intact after it is once put on the letter.

RUBBER packing may be made steam and air tight hy heing hrushed over with a solution of powdered resin in 10 times its weight of strong water of ammonia. At first this solution is a viscid, sticky mass, which, however, after three or four weeks becomes thinner and fit for use. The liquid sticks easily to rnhher, as well as to wood and metal. It hardens as soon as the ammonia evaporates, and hecomes perfectly impervious to liquids.

To Prepare Wax for Flowers and Fruit.

Take four ounces white wax, two teaspoonfuls heleam of tir, one and one-half teaspoonfule eweet oil; melt all together in a vessel pleced in hot water. If you wieh yellow wax, add cue and one-half teaspoonfule of chrome yellow to four ounces of wax; for green, the same amount of ohrome green; for other colors use carmine powder, Pruesian hlue, red lead, hlack lead, etc. You will need gamboge hristles, moss quille, large and small wire. If yoo have not a suitahle brueh you can make a little swah and uso instead.

Now, for your green leaves, take a natural leaf—e rose leaf is good to etart with—wet it in oold water, dip yoor hrosh in yonr melted wax, hruch the underside of the leaf nntil yoor wax leef is es thick as yon wish; you can readily separete the leaves with a thin knife hlade. Cnver the coarse wire with green wax, then place yonr leaves oo, having a knoh of wax on the end of the wire.

Where you form the flower, it requires different colors; for a rose, yellow wax; the gamboge is to dost tbe center of the rose. It requires patterns to form the flower leaves. Ley the roseleaf in your hand, press your finger on to give it the right shape, then lay a plait in the end yon place on the wire. A natural flower to look at will assist very much. It requires skill aod judgment to succeed well.

ARTIFICIAL AGATE.—A glass which closely resembles natural agate may he obtained by combining 100 lbs. of sand, 100 lbs. of red lead, 32 lbs. of potash, 22 lbs. of borax, 4-10 of a pound of arsenic, and chloride of gold to the amount of ahout $5 in value. The gold is to he first dissolved in as small a qnaotity as possihle of aqua regia, dilnted with 10 lbs. of water, and intimately mixed with the flux. The melting pot is then placed in the furoace, and the material allowed to melt together for seven or eight hours, when it is to he stirred with a stick, or some potatoee thrown in. The working of the glass can then hegin, and a mass is ohtained which presents the grey, hrown, milk and crystal-white shades and marks of oatural agate, and a second molting fits it very well for the manufacture of ornamental articles.

Popular Young Folks' Publications.

We have heen constantly receiving the serials from the noted and popular honse of D. Lothrop & Co., Boston, including "Wide-Awake," "Bahyland," "Paosy" and "Little Folks." We suppose a great many who will read this notice know these hooks, for "Wide-Awake" has reached its 12th volume and "Pansy" its ninth volnme; and the others have eaoh had several hirthday anniversaries, hnt every new nnmher of each is a fresh gem. They do not repeat themselves, and they never grow dnll. They delight every child, and make older persons feel young again. The Septemher numhers are no exception, aad the "Truant Fire-Flies," "Bahy Boys' Band," "The School in the Meadow," and other pictures, will charm and fire the young heart as if they were the first ever seen; they are so like nature—fresh and full of life. And the kittens in these hooks must set every lover of cats wild with delight, the kitten instinct is so visihle in them. These hooks are very justly popular.

And now we want to say, in addition to the above, that last spring we had the pleasure of a visit from Mr. Lothrop and his wife, who writes so charmingly nnder the *nom de plume* of Margaret Sidney. They were much delighted with what thoy saw in a flying visit to southern and central California, and returned to Boston happy and hrim full of good will to California and its progressive people, and we happen to know that Mr. Lothrop has some good undertakings of special henefit and interest to California in the way of future puhlications, so that his recent visit is one of more than ordinary significance to this coast. This is one of the largest and most thrifty puhlishing houses in America. Its works are chaste and useful in character, and are issued at the rate of one first-class hook per day, or faster.

WINDING EXTRAORDINARY.—A remarkahle instsnce of winding coal recently took place at No. 3 pit, Newlands, near Baillieston, helonging to Messrs. Dunn Bros., Braehead collieries, nnder the management of Mr. John Dunn, the practical partner of the firm, and the underground department is under the charge of Mr. Henry Nishet. The depth of the pit is shout 120 fathoms. The eogines are coupled horizontal, 18 inch cylinders, 4 ft. 6 inches stroke, and the quantity of tuhs drawn from the ehaft for one shift was 1,865. The cages are douhle, holding two tubs ahreast. For one hour's winding during the day, there were drawn 240 tuhs, giving an average for drawing, changing, etc., of 30 secs. for each "tow." The ahove quantity is coal only, so that, including ruhhish, etc., drawn dnring the shift, there were considerably over 1,900 tuhs brought to the hank. The average output is ahout 1,600 tuhs per day.—*London Mining Journal.*

OPINION OF AN EMINENT GERMAN SURGEON. The *Athenaeum* saye Prof. Esmarch, an eminent German surgeon, has pnhlished a lecture, which he delivered hefore the Physiological society at Khiel, on the treatment of Geo. Garfield's wound. Prof. Esmarch's lecture was to the effect that Gen. Garfield might have been alive hut for the treatment he received.

Good Health.

KEEPING THE PORES OPEN.—The importance of the breething function of the skin can be easily shown hy experiment, for if we varnish over the ekin, the suhject eo vernished often diee of nothing more or less thsn suffocation. Insects hreathe entirely through their skin. The ekin does about ooe-thirtieth of the work performed hy the lungs, and in disease of the latter it is very likely mnch more active in porifying the blood. Then, fourthly, the ekin carriee off hy the sweat moch solid matter that would he, if reteined in the hody, very injurious. Under ordinary circumstances, about a pound and a half of sweat is given off hy a man in a day. The body is also kept at a proper temperature hy the evaporation of the eweat; hence the importauce of keeping the skin clean in order that natnre may regulate the heat of the body. Inattention to these points gives rise to various disorders of the system, especially colds, coughs and the like. The fiuid which is sweated out of the hody comes from the hlood-vessels in the deeper part of the skin. A word more ahout the little fatty glands, and this part of the suhject may he left. These little etructures give exit to fatty metter, thet, hy inducing a slight greasy state of skin, prevents too great evaporation; it acts as a protection to the skin against irritants, and it often carries off certain fatty acids from the hody. In an irritative skin these glands get choked up hy the retained fatty matter, and we then have pimples, as ahout the face.

REMEDIES FOR VEGETABLE POISONS.—The most dangerous of the vegetahle poisons at this season of the yesr are the hemlocks (inoluding the hemlock dropwort, water hemlock and the common hemlock), fool's parsley, monkshood, foxglove, hlack hellehore or Christmas rose, huckhran, henhane, thorn apple, and deadly nightshade. In a oase of vegetahle poisoning, says *Knowledge*, "emetics (the sulphate of zinc, if procurahle) should be nsed at ooce, the hack of the throat tickled with a feather and copious drafts of tepid water tsken to excite and promote vomiting. Where these measures fail the stomsch pump must he used. Neither ipecacuanha nor tartar emetic should he used to csuse vomiting, as during the nansea they produce hefore vomiting is excited, the poison is more readily absorhed. Vinegar must not he given until the poisonous matter has heen removed; hut afterward it may he given in doses of a wineglassful, one part vinegar to two parts water, once every two hours in mild cases, hut oftener—two half-hourly doses—in cases of greater severity. Where there is stupor the patient should he kept walking ahout, and if the stupor is great, cold water may he dashed over the head and cheat. Strong coffee may he used where the narcotic effect of the poisoning is very marked. It is all-important that in cases of vegetahle poisoning a medical man should he sent for st once.

THE MYSTERIES OF A HAIR BRUSH.—A writer in the American *Journal of Microscopy*, has heen exploring the forests of hristlos in a hair hrush, surreptitiously purloined from a lady's toilet-stand, and, though it contained nothing which we are accustomed to regard with nnqualified horror, the results of his investigation prove that there are mysteries ordinarily undreamed of in simple appliances of the toilet. There are concealed in the damp lint of hair-hrushes, unless kept clean hy the use of hicarbonate of potassa or carhonate of soda, many living things, too small for detection hy the naked eye, some of which, we are told, are of more than suspicious character, heing known as the originatore of scald-headed and other diseases of the scalp. The suthor concludes his article hy a caution against wetting the head, recommending dry hrnshing instead. He also recommends the use of a weak solution of carholic soid or snlphate of sods, as a cleansing material for hair hrushes.

MEDICAL CONSULTATION.—The practice of calling in an additional doctor, when the one already in attendaoce feele the case hecoming grave, has, if the latter is a skillful and experienced man, somewhat the same reasons in its favor as Paliamentary goverument. The appearance of doctor the second strengthens the nerves of the patient's family, and sometimes, though not always, those of the attendant physicisn. The patient himself is generally startled and alarmed hy it. In 99 cases out of 100 it has not, as everyhody knows, any influence whatever on the management of the case. The consulting doctor almost always approves of what the other doctor has done; seldom or never does he suggest anything new. But he makes the other doctor decidedly more comfortahle in hie relations with the family, and makes the family comfortahle in the feeliog that they have loft nothing in reason untried.—*Nation.*

ACID FOR THE HANDS.—Remember that one can have the hands in soapsuds with soft soap without injury to the skin if the hands are dipped in vinegar or lemon juice immediately after. The acids destroy the corrosive effects of the alkali and makes the hands soft and white. Indian meal and vinegar or lemon juice used on the hands when roughened hy cold or labor will heal and soften them. Rnh the hands in this, then wash off thoroughly and rub in glycerine. Those who suffer from chapped hands in the winter will find this comforting.

SAN FRANCISCO:

Saturday Morning, Oct. 7, 1882.

TABLE OF CONTENTS.

GENERAL EDITORIALS.—Concentration in Metallic Lead; New Engine Lathe; Copper, 225. Passing Comstock Rocks; Timber on Mineral Lands; The Denver Exposition, No. 8, 232. Blow-Pipe Assay of Silver; Academy of Sciences; Heroism of Miners, 233.

ILLUSTRATIONS.—Improved Engine Lathe, 225. Fig. 1—Charcoal Bore for Assay; Fig. 2—Keeping Globule Fluid with Side of Flame, 233.

MECHANICAL PROGRESS.—Interchangeable Systems of Manufacture; New Locomotives; Rule for Setting a Safety Valve; Substitutes for Steam; Interesting Pre-Indian Relics from Virginia; A New Screw; Lubricating Material, 227.

SCIENTIFIC PROGRESS.—Is Man the Highest Animal? A Lunatic's Explanation; New Source of Ozone; Floating Matter in the Air; Funerals as Disease Breeders; What Next? Sun Spots and Great Storms, 227.

MINING STOCK MARKET.—Sales at the San Francisco Stock Board, Notices of Assessments, Meetings and Dividends, 228.

MINING SUMMARY from the various counties of California, Nevada, Arizona, Colorado, Idaho, Montana, New Mexico, Oregon, Utah and Alaska, 228-9.

USEFUL INFORMATION.—Fishing for Rats; Flies and the Caster-Oil Plant; Leather Guns; Postage Stamp Frauds; To Prepare Wax for Flowers and Fruit; Artificial Agate, 231.

GOOD HEALTH.—Keeping the Pores Open; Remedies for Vegetable Poisons; The Mysteries of a Hair Brush; Medical Consultation; Acid for the Hands, 231.

MISCELLANEOUS.—Forest Trees of California; Metallurgy of Nickel and Cobalt; Stout-Hearted Men; Duncan Concentrator; Life of Mines; A Terrible Fall, 226. Recent Contributions to the California State Mining Bureau; Utopia; Extraordinary Water Pumping; The Forests of the Pacific Coast, 230. Reduction Works; Six-mile Canyon, 231.

Business Announcements.

Passing Events.

The absorbing topic in the storm, which has drenched the central areas of the State from the coast to the mountain tops. Along the northern and eastern limits of the storm there were fierce features—the pelting of the hailstones and furious gusts of wind—and over the whole of its extent the storm had more the method of a winter's visitation than the wonted gentleness of the early rains. According to the Signal Service report, which we print in another column, it appears that the heaviest downpour was at Sacramento rather than near the coast.

In an examination of the records to discover whether light or heavy rain in October could be made to indicate the annual total, we find no concord of results. Both wet and dry years have followed a heavy October rain, and they have followed a dry October also.

The present storm will bring a heavy loss on the numerous men who have been mining in the channels of the Yuba and Deer creek. The rapidly rising streams sweep away their flumes and wing-dams, fill the shafts and cuts with debris, and the numerous sluice float off the pumps and undershot wheels. Many of these river miners are Chinese, but the white men engaged in the business are numerous enough to lose many thousands of dollars. This is a hazardous industry, depending for success not only on the richness of the ground, but also upon the rains holding off till late in the season.

From the quartz-mining regions there is little novel to note. Work is going on everywhere, as usual, and there are no special excitements, or "booms," to be talked of just now.

Comstock Rocks.

We have had the pleasure, within the past few days, of examining a very valuable and instructive collection of Comstock rocks donated by John W. Mackay, Esq., and Capt. T. G. Taylor, to the London Geological Society, and which will be presented to that society through one of its Fellows, Mr. Melville Attwood, of this city.

The collection from the south end of the lode is principally from the Yellow Jacket mine, and comprises specimens from the surface down to the bottom of the lowest workings. The collection is so arranged that it presents a vertical section of the rocks met with in the sinking of the Yellow Jacket new shaft, which has attained a depth of 3,023 ft.

From the north end of the lode, the specimens are principally from the Union Con. shaft, taken every five feet. The characteristic rock specimens from Mt. Davidson were taken by Dr. Hector, of the New Zealand Geological Survey, during his visit to the Comstock. Microscopic sections have been cut from most of the specimens, some of which are very beautiful to look at. Mr. Mackay and some other old Comstockers have spent some time in looking over the collection.

The character of the rocks met with, in depth, we are told, throw quite a new light on the geology of the Comstock; but we want the determination of them by the London society before saying anything about them. Hugh Miller, in one of his works, very aptly remarks: "Geology propounds many a hard question to its students—questions quite hard and difficult enough to keep down their conceit, unless, indeed, very largely developed."

There are some 300 specimens in this collection, and microscopic sections have been made for each of the varieties of rock. From a casual examination of the rocks, their character, would indicate that the prospects for ore bodies were much better at the north than the south end of the lode. The vein matter is shown as well as the enclosing rocks. All these specimens will be examined by such men as Phillips, Rutley, Middlestone, and will be considered in London a very valuable collection. In fact this is the only complete collection of the kind which has been made here, as the enclosing rocks and vein matter are shown. This is the way such collections should be made, so as to represent the ground as it really is. Not only the ore should be shown, but the minerals associated with it, and the enclosing rocks. Specimens of ore alone illustrate nothing of any special value. A mere collection of ores shows what of common value has been produced, but forms no guide at all to future explorations. What is wanted is to illustrate the work accomplished in such a way that others may benefit by the experience gained, from a geological point of view. The collection of rocks to which we are referring, and which is in Mr. Attwood's office in this city yet, is probably as fine a one as was ever collected, as it shows the ground from the surface to below a vertical depth of 3,000 ft.

TIMBER ON MINERAL LANDS.—Secretary Teller has rendered a decision in respect to the right of mill owners and residents upon mineral lands to cut timber from such lands within the lines of mining claims regularly located, and possessed under local land laws and customs, subject to the United States laws governing such claims. The Commissioner-General of the Land Office in a recent letter, expressed the opinion that the locator upon such lands was unable to protect himself in the courts or otherwise, as he has only a possessory right to said lands, subject to certain subsequent conditions; but that he can obtain a patent, and although the title to the land is still in the United States court, the Government cannot protect him. He based this opinion on the ground that the act of June 1879, now in force authorizes settlers and residents in mineral districts to cut and remove lumber from public mineral lands for any purpose except for export. He indicated, however, that a reservation might be made by the Department, making a regulation in favor of mining locators to timber growing upon their claims. In this opinion the Secretary does not concur. He says the locators of mining claims; so long as they comply with the law governing their possession, are invested by Congress with the exclusive right of the possession and enjoyment of all the surfaces included within the lines of their location. This ought, he says, to amount to a property capable of being enjoyed and transferred, and may be protected in the courts, and it is the duty of the possessor to care for his own if trespass be attempted; but, he adds, the duty is not imposed upon the Government of intervening to protect an individual occupant.

MINING matters in Cataract district, Montana, are looking up considerably, and a boom may be expected in the near future. Like many other of the rich mining sections of the Territory, the development of Cataract district has been greatly retarded in the past by lack of capital. But the near approach of the railroad (about 30 miles) and the consequent influx of eastern capital seeking proper investment, have made matters assume a different aspect there as elsewhere. Several sales at good figures have been made recently, and some of the best properties in the district have been bonded for eastern parties.

The Denver Exposition—No. 8.

[Editorial Correspondence.]

CUSTER COUNTY.

Directly south of Fremont is Custer county, the mineral wealth of which, though limited in area, has been found to be quite varied, novel and important. The first mine opened in this county was the Senator, in 1872. Two years later work was commenced on the Pocahontas, Humboldt and several other mines. The total yield of the county up to 1880 was about $2,000,000; since which time we have been unable to get the yield, which must have been very large, and constantly increasing.

The Most Singular Mineral Discovery

Yet made in this, or perhaps any other, region is the Bassick mine, which was discovered in 1877 by Mr. E. C. Bassick, from the State of Maine. The ore obtained from this mine is unlike, in its association and occurrence, any other ore in the world. It was first observed as "float" on the surface, where it lay unnoticed and overlooked, as valueless, by hundreds of miners who were constantly passing and repassing. The ore was in the shape of rounded bowlders, mostly about the size of ordinary cobble stones. Mr. Bassick, after passing over them for months, to and from his daily labor, was finally led to examine more closely into their character, when he discovered that every bowlder was enveloped in a covering, of greater or less thickness, consisting of a material entirely foreign to the substance of the bowlder itself, which was easily broken or shelled off by a blow from any hard instrument. His curiosity was excited to learn the character of the enveloping material. On taking some of it to an assayer, it was pronounced to be very rich in chloride of silver. He then commenced to search for the source of these bowlders, which was soon found near the top of the hill. On excavating, they were found in a compact body, cemented together by the material which surrounded them. Some ten tons, taken out just below the surface, were sent to a smelter, from which Mr. Bassick received a return in gold and silver of over $12,000. He then became satisfied that he had made a valuable discovery, organized a company of miners, and commenced prospecting. From that time to the present the Bassick mine has been noted as one of the most valuable mines in the State. This mine is still regarded as

A Geological and Mineralogical Puzzle.

A more particular description of which we are sure will be acceptable to our readers. Commencing near the point where the ten tons realizing $12,000 were taken out, the company began sinking, and continued until they reached a depth of 138 ft.—all the way through this conglomerated mass of bowlders. Cross drifts were also run which proved that the fissure or chimney, whichever it might be, was, on an average, from 60 to 70 ft. in width. At this point a tunnel, commenced on the slope of the hill, was run to intersect the shaft. The shaft itself has now been continued until it has reached a depth of over 950 ft. from the surface, without any indication of decrease in either width or extent of the deposit, and without finding any bottom to the same!

It is very difficult to learn particulars with regard to this remarkable mine, as the owners are quite reticent, and refuse admission to the mine to any but employes; but your correspondent succeeded in finding several parties who were more or less conversant with the mine and its workings, and from whom he gathered most of the above and other facts hereinafter to be given, which are undoubtedly correct in the main and very interesting.

The Character of the Deposit.

This immense deposit, so far as explored, is continuous from the surface down. The bowlders vary in dimensions from nut size up to 10 and 12 inches in diameter—seldom larger. The bowlders, divested of their mineral envelope, which varies in thickness from that of a knife blade up to half an inch, consist of representatives of all the rock of the neighboring country—granite, porphyry, lime, trachyte, sandstone, etc., such as might be expected to be found in any considerable river running through that region. Rounded masses of vein rock are also sometimes found—one of which, on exhibition, was a bowlder of almost pure iron pyrites, one side of which had been broken off to show its character. The bowlders are all thoroughly water worn and nearly spherical. Interspersed here and there among them are found small quantities of coarse sand, cemented by the same character of mineral which envelopes the bowlders. Every bowlder is completely encased with mineral. A large quantity—some two tons, more or less—of these bowlders, some of them with their incrustations entire, others undisturbed were on exhibition. Down to a depth of about 200 ft. the incrustations are almost exclusively enriched with chloride of silver; below that depth the enriching mineral is quite diverse in character, and consists of the following singular and varied combination of minerals: Tellurides of gold and silver; chloride of silver; zinchlende, often beautifully crystallized; tellurides of lead and silver with gold; copper pyrites, carrying gold and silver; arsenical pyrites; gray copper ore and free gold.

Near the surface the bowlders are simply covered with the incrustation, which constitute the only vein matter proper found in the mine, and which, aside from the gold and silver that it carries, consists chiefly of lime and silica; but as depth is gained, many of the bowlders have become mineralized throughout their entire bulk, and are rich in the precious metals. According to our informant, the richest and selected ores pay as high as a thousand dollars and over to the ton. Such ore is also found in considerable quantity. The bowlders, after their coatings of tellurides, etc., are roughly taken off, together with the poorer matter which fills the interstices, are crushed and concentrated as second-class ore, and is said to be very rich. The general average of the output of concentrated ore is from seven to nine tons a day. Some few weeks ago, and while in Denver, we were told that a mass weighing 1,500 lbs. was broken up in the mine and raised, which realized $30,000, or $20 to the pound, in gold and silver.

The Country Formation.

The section of country properly included in this mineral district is about 12 miles east and west by 6 or 8 north and south, with the Bassick mine centrally located near its eastern border. Included within this area are several local districts, notably the Rosita and the Silver Cliff. The veins and ore deposits in these districts are nearly all quite phenomenal in character, although no other so much so as the one just described. Mr. Smith, the Colorado State Geologist, regards them as of four distinct classes or characters, which he describes substantially as follows: First, fissures traversing both the archæan and eruptive rocks; second, contact veins between the eruptive and stratified rocks; third, extinct geyser deposits, consisting of great "well holes," filled with bowlders, coated with a shell of rich ore (as we have described in the Bassick mine), and fourth, eruptive deposits, or overflows of highly silicious matter, containing principally silver chlorides.

According to Fossett, there appears to be a grand porphyry or trachytic dyke extending nearly east and west through this district, and it is within this dyke, or on the line of contact between it and the granite upon the north where the mines which have made this county so famous are found.

The Bassick Mine

Appears to be on this line of contact. So also is the Bunker Hill, the Plata Verde and the Bull Domingo. The mines at Rosita and Silver Cliff appear to occur in fissures or deposits in or upon the intrusive trachytes.

By some the Bassick mine is considered to be a chimney, or "well hole," the result of an ancient geyser. Explorations have not yet been carried to a sufficient extent to fully determine its character; but the impression generally prevails that it will eventually be proven to be at that point a huge fissure, which at some distance east or west will be found to narrow down to one of moderate width, filled mainly with ordinary mineralized vein matter, instead of bowlders as at the present point of working.

How these bowlders got there, as they evidently did from the surface, is the great puzzle connected with this extraordinary deposit; but it is easy to conceive how they might have become coated with mineral, either from infiltrating waters from above or mineral working bearing vapors from below. That a guiser "well hole" could have been so filled up with bowlders is scarcely probable; but we may readily imagine that an open fissure with a free passage for the water at a lower elevation might be gradually filled up with such debris, and the same become subsequently mineralized either by infiltrating waters or intrusive vapors. The richness of the deposit will ensure an early solution of the mystery. The exhibit from this mine represented every characteristic of the ore as above described.

The mine has been capitalized on a basis of $10,000,000, its discoverer retaining a large share of the stock. The company has one of the best equipped hoisting plants in the State. The engine and hoisting works are located in a large chamber excavated at the junction of the tunnel and main shaft 158 ft. below the surface. A concentrating mill has been erected to properly handle the low-grade ores, by which the total output of the mine is made available. The ore is shipped to the Argo Smelting Works, near Denver, for treatment.

Other Mines.

Although there was some considerable mining carried on in this county prior to the discovery of the Bassick, still it was not until after that discovery that public attention was especially directed there. Soon after Mr. Bassick's wonderful find, prospectors were very active in their researches in that immediate neighborhood. Perhaps one of the most promising and best-developed districts opened since the discovery of the Bassick is the Silver Cliff, located about six miles west of that locality, where several producing mines are now being worked, the most important of which is the Silver Cliff. This mine is located at the abrupt termination of a hill, around the base of which cattle had been grazing for years, until a wandering prospector, passing that way in the spring of 1878, noticed some peculiarity in the rock, knocked off a piece, carried it to an assayer, and was astonished to find it rich in silver—horn silver. The usual excitement followed; the cattle upon the neighboring plain were soon displaced by busy crowds of miners, wild in their search for wealth, and before the snow again made its appearance a populous town had grown up there,

with the osual accompaniment of stores, saloons, gambling houses and motley crowds of men.

This class of ore was then quite new in Colorado, and it was soon found to be unprofitable to send free-milling silver ores 50 miles to smelters for treatment. The ores, already chlorodized in nature's laboratory, needed no roasting. They could be, and soon were, taken directly to the stamps and pans erected upon the spot for a much cheaper treatment. Within a year the Silver Cliff and Racine Boy were capitalized in New York for $10,000,000, with James R. Keene, the famous California speculator—now of New York—for president, and I. Wormser, secretary. Within another year an immense stamp and pan mill, covering two acres of ground and costing $125,000 was busily at work stamping out and gathering up the rich chlorides of Silver Cliff. The process employed here is the one well known in this State as the "Washoe process," and this, we believe, is the only locality in Colorado where that process is employed. The mining at Silver Cliff is like that of a quarry rather than a mine. The men work into the face of a great cliff, and quarry out silver ore, as in other places granite and slate are obtained for building purposes. At the same time, shafts have been sunk from the floor of the quarry, which have been supplemented by the diamond drills, proving that rich mineral is plenteous, not only in width, but in depth.

This promises to be both a rich and a most permanent mining district. In addition to chlorides, carbonates are also found in considerable quantity. Quite extensive deposits and veins of galena are also found near by. Nearly all the ores of this district carry more or less gold. The Silver Cliff and Racine Boy, and some other neighboring mines, appear to be inclosed in an eruptive rock—the trachyte dyke, already alluded to—which is of great breadth, traversing a granite country. The northerly line of contact with the granite is only about two miles northeast from Silver Cliff.

Along this line of contact, and commencing at the easterly limit of the district, we have, first, the Bassick, then the Bunker Hill group, next the Plata Verde, and, lastly, the Bull-Domingo. The Bunker Hill group consists of three mines, which have not yet been very extensively developed, although they make a very fine and varied show of rich ores at the the exposition building. This property has been capitalized on a basis of $1,000,000, with Carl Wulster, the discoverer and an old Californian, as President and General Manager. The indications are that this series of mines is on the same fissure or contact line as the Bassick, which property it adjoins. Following this contact line some three miles farther west, we come to the Plata Verde silver mining company, the developments of which are exceedingly promising. The company has a mill similar to the Silver Cliff, of 80-ton capacity, using the "Washoe process." The property has been capitalized on a basis of $10,000,000.

The Bull-Domingo—also on same line of contact, is a joint stock company, with a capital of $10,000,000. The original locators of this mine sold out for $250,000 to the present company, of which ex-Senators W. H. Barnum and S. W. Dorsey are respectively President and Vice-President, with William M. Lent on the board of directors. This mine, like the Bassick, was first opened into an immense deposit of bowlders, but in this instance covered with a deposit of galena, carrying silver instead of chloride of silver, as at the Bassick. The company has an extensive plant for hoisting, concentrating, etc. There are many other promising mines in this neighborhood which we have now no time or space to describe. Director Burchard, in his last Mint report, enumerates 21 mines by name in this vicinity as producing properties during the year 1880.

The Custer County Exhibit

Was quite full, and of more than ordinary interest. The ore from the Bassick mine, however, was the chief center of attraction, both to miners and visitors of scientific proclivities. The show of graphitic molybdsnate of lead, with cromate and oraniom, was much admired. This county also made the only exhibit of cobalt and nickel ores in the building. These ores attracted much attention. They contain gold, silver, copper and lead. The Bunker Hill group of mines made a very fine exhibit, but quite apart from the general mineral exhibit, and in the machinery department.

W. B. E.

THE Mountain Chief and Mt. Thompson mines, Cataract district, Montana, have been bonded within the past few week at $30,000 each—both to the same parties. All information obtained regarding these properties shows them to be two of the most promising silver mines in the country. They are situated on the same vein as the famous Rumbey and Comet mines, and are about one and a half miles distant from the latter, in a westerly direction.

IN 1881 one milliard three hundred and fifty million letters passed throug the Postoffice of France, an increase of four hundred an eighty-five millions since 1877. By dividing the number of letters in 1881 by the number of population, it will be found that thirty-seven letters for each inhabitant must be allowed for the year. So that in France each individual writes one letter in nine days.

ALL the iron mills in the Wheeling (W. Va.) district will resume operations Monday.

Blowpipe Assay of Silver.

In order to separate silver from its ores and compounds by the blowpipe, the previous metal must be formed into an alloy with lead; then the silver lead concentrated by a process, known as scorification, by which the bulk of the lead, copper, etc., is oxidized; then the concentrated silver lead is subjected to the process of cupellation, whereby all the lead and other base metals are oxidized, and the silver left in the form of a metallic button.

Commercial ores, especially very rich ones, frequently differ in richness: it is, therefore, advisable, in all cases of importance, to make two or three assays of each sample, and if the results do not agree, to make one or two more, and then to take the mean or average of the whole; and to that add the loss of silver, proved by the synthetical assay. In assays of alloys, the proof and synthetical assays are absolutely

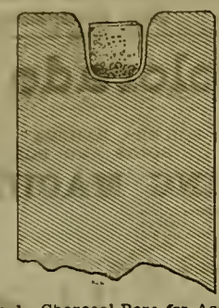

Fig. 1.—Charcoal Bore for Assay.

necessary to prove the work. In order to show the latest practice, we have reproduced some engravings, and take the substance of the text on this subject from a work just published in London, by Mr. George Attwood, M. E., F. C. S. on "Practical Blowpipe Assaying."

Reduction to Silver Lead.

The ore is reduced to powder and passed through a sieve of 2,000 holes to the linear inch; it is then thoroughly mixed, and 1.5 grains weighed out. The ore is fluxed with borax and lead. The amount of borax required is dependent on the fusibility and amount of matter to be slagged. Ores containing much gangue, iron, cobalt or tin require one and one-half grain borax glass. When ores contain little gangue and much metallic sulphides .8 to 1.2 grains borax glass is quite sufficient. Should the assay during the fusion show itself refractory, a little more borax may be added to it.

The amount of lead required depends on the other metals present in the ore. A substance containing 7% copper or 10% nickel requires five times its weight of lead (7.5 grains), but when it contains more than this amount the proportion must be dependent on the amount of copper etc., present. When this is not known it is in all cases better to use too much than too little lead, as in the last case the separation of the silver from the copper is not effected, and the red alloy rich in nickel cannot be cupelled.

The following table will show the relative proportions to be employed:

Copper glance, containing about 80% copper, requires 15 times its weight of lead.

Covellite, containing about 65% to 66% copper, requires 12 times its weight of lead.

Purple copper, containing about 55% to 60% copper, requires 11 times its weight of lead.

Tennantite, containing about 40% to 41% copper, requires 10 times its weight of lead.

Koferblende, containing about 40% to 41% copper, requires 10 times its weight of lead.

Fahlerz, containing about 30% to 40% copper, requires 10 times its weight of lead.

Cupreous bismuth, containing about 34% to 35% copper, requires 10 times its weight of lead.

Copper pyrites, containing about 30% to 34% copper requires 10 times its weight of lead.

Sulphide of copper and silver, containing about 30% to 31% copper, requires 10 times its weight of lead.

Tin pyrites, containing about 29% to 30% copper, requires seven times its weight of lead.

Enkairite, containing about 23% to 25% copper, requires seven times its weight of lead.

Bournonite, containing about 12% to 13% copper, requires seven times its weight of lead.

Copper regulus, containing up to 45% copper, requires 10 times its weight of lead.

Copper regulus, containing up to 50% to 60% copper, requires 10 times its weight of lead.

Lead speiss, containing up to 10% to 40% copper, requires 10 times its weight of lead.

Cobalt speiss, containing up to 40% to 50% copper, requires 10 times its weight of lead.

The assay having been prepared, is poured with care into a soda-paper cornet, placed in a charcoal bore of about .4 of an inch in diameter at the bottom, and from .5 to .6 at the top. The cavity is poured wider at the top, to allow the flame to reach down to the bottom of the bore. The top of the cornet is then closed up with a pair of pliers and pressed firmly down. This is shown full size in Fig 1.

The assay is now inclined toward the flame, and a reduction flame, at first moderately strong, is employed to cover nearly all the top of the assay. The paper is not consumed until the particles below it have entered into fusion, and prevented mechanical loss. The whole assay is now submitted to a strong but pure reducing flame, at an angle of 35° to 36°. By the action of this flame, a part of the sulphur, arsenic, antimony, zinc, etc., is volatilized, but the greater part, along with the metallic bases, unite with the lead to a globule, while the gangue, the difficultly reducible metals, and a smaller part of the easily oxidizable, but non-volatile metals (which have been oxidized by the first action of the heat) combine with the borax to form the slag. With refractory ores, it often appears as if the slag were quite free from lead globules, but this is not to be trusted to, as often under the surface of the well-fused slag, unnoted upon particles of the ore may be concealed, which is only to be obviated by moving frequently the charcoal, so as to change the portion of the assay. This must be done, also, with easily fusible assays, as by this means the lower part of the assay and the carbonized soda paper is exposed to the flame. As the paper is hardly acted upon in a good reducing flame, it is necessary to direct the flame onto the slag while the slag is not affected. When consumed, the whole slag is again covered by the reducing flame, to reduce any litharge that may have been formed, and which, by this means, is united to the main globule.

If the slag, after being treated thus in the reducing flame, and moved about several times, forms a globule itself, and shows no lead globule, and perfectly fluid, it may be considered free from silver. While the slag is covered with the reducing flame, the metallic globule is only touched by the side of the flame, to keep it perfectly fluid and ready to take up any straggling lead globule (Fig. 2). The assay is allowed to cool, and then removed with the plier and placed between two thick pieces of paper on the steel anvil, and broken up with the hammer; the lead button, carefully picked up

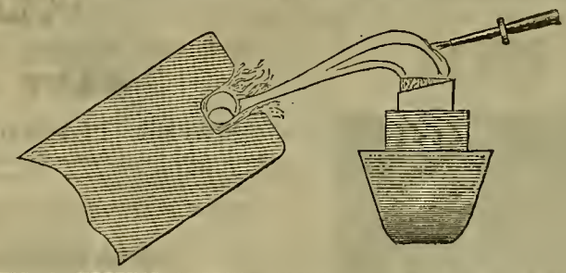

FIG. 2.—KEEPING GLOBULE FLUID WITH SIDE OF FLAME.

with the pliers and brushed, is then ready for the next process.

The finely crushed slag is washed in the water and then examined with the magnifying glass, to see if any small globules of lead, etc., remain, and if such are found the safest plan to secure a perfect assay is to repeat the operation. In assays of no commercial importance the fine globules can be separated from the slag by vanning in the water and then adding them to the main globule.

Academy of Sciences.

The regular meeting of the Academy was held on Monday evening last, Dr. Behr, Vice-President in the chair. A. T. Hatch was proposed for membership, and the following were elected as resident members: F. R. Waggoner, M. D., Prof. W. E. James, Col. C. W. Brush, C. E. Joseph, D. Redding. W. R. Cunness, M. D., David Wooster, M. D., George Cadwalader.

A. W. Jackson Jr., of the University of California, read a paper on the "Glaucophane rocks of California."

Charles Gibbes, C. E. read a paper on "The Fossil Jaw of a Mammoth," taken from the quarry at Carson, Nevada, just above the fossil footprints. After discussing its various characteristics, he came to the conclusion that the teeth corresponded more nearly with those of the *Elephas americanus*. Molds of this jaw are now being duplicated in plaster of paris, and Tabor has taken photographs half the natural size, which were exhibited. About four weeks since Major Garrard uncovered 79 additional footprints of four-toed birds at the prison quarry in Carson. The middle toes measure five inches in length, the hind toe nearly two inches, the spread of foot nine inches, and the step is from 21 to 23 inches. Prof. Joseph Le Conte, after examining the fossil teeth, thought they resembled those of the *Elephas americanus*, yet were more nearly identified with the *Elephas intermedius*, heretofore only found in Europe. He said they were certainly not those of the *Elephas primigenius*. He then announced that at the next meeting he should address the Academy on the genius and work of the late Charles Darwin.

Charles Walcott Brooks exhibited an aerolite, composed of mixed stone and meteoric iron, which fell in six inches of water along the shore of Wynootchs river, at camp No. 7, about 70 miles from its mouth. Dwight Whiting, a member of the Academy, was there stooping to wash his face, at about 11 P. M., when on a dark night in the forest, June 20th, 1882, he saw an intensely bright light, illuminating the neighborhood as thoroughly as sunlight, and he felt the windage and heard the sound of a meteorite, which passed within two feet of his head and darted into the shallow water in front of him. The water instantly boiled, and he selected a stone, easily recognized, and dropped it into the water, over the spot where the bubbles rose. The bottom was hard sand. He retired to bed, and at daylight found just beneath his index stone a meteoric stone, which was carefully examined by members of the Academy. Its entire outer surface bears marks of having been fused, and is exceedingly heavy. It is about three inches long by two inches thick and an inch and a half wide.

The secretary read a paper from Prof. George Davidson, U. S. Coast and Geodetic Survey, embodying notes on the comet. This we refer to more at length in another column.

Heroism of Miners.

The following is communicated to the Grass Valley *Tidings* of a few days since: The terrible break-down in the Idaho mine's incline last Saturday morning, that caused the death of Thomas Williams, and the serious injury of Richard Carter, Frank Johns and Richard Johns, called forth acts of courage, and daring and heroism, on the part of their fellow-workmen, that have rarely been equaled, even by men who risked their lives for glory and renown. These were simply deeds of self-sacrificing devotion, without a thought of praise, that men would have for them; they thought only of their friends being in danger.

The cave occurred about 640 ft. from the bottom of the incline shaft. Fortunately, there were no men in that incline at the time. If the cave had occurred an hour earlier, when the men were going to their work, there might have been a dozen killed—for as the mass went down, it increased in quantity and velocity, carrying everything before it. Some parties who were at the stations of the levels, as the mass went by, say it left a blaze of fire, caused by the friction of the rocks, and was terrible to see when they knew it was rushing down on four helpless men.

Wm. Magor deserves particular mention. He was in the 1300 level, and was informed that the cave occurred, and the mass had gone down upon the shaft men. He hurried out to the 1300 station, and, without stopping to consider the very great danger he was in, made his way down the shaft, when the dirt and rock had not stopped falling, and when he got near enough to call to the men below, Frank Johns, who was severely wounded and fastened down in the debris, answered Magor, and told him that he (Magor) had better get out and save himself, as by staying there he surely would be killed. To this Magor replied: "Never mind me; we will have you all out, or we will all die together." Soon Magor was joined by Richard Eva and Jerry Angove, and soon all the miners came to lend willing hands to save their fellow miners. Then came the long and apparently insurmountable task of getting the dead and wounded out of that awfully dangerous place. These hurt men had to be pulled and carried up to the 1300 level, and no one knew at what moment another cave would come and sweep them all to the bottom. After they were brought up to the 1300 level, they had to be carried up to the 1200 level, and then up the backs to the 1100 level, and through the backs again to the 1000 level, and to the cage shaft. It hardly looks possible that men so badly hurt as these were to be got through such places as they were taken through.

The writer has been over every foot of ground many a time, and knows all the difficulties they had to contend with, and he is of the opinion that no others but underground miners could have performed the duty these men of the Idaho did.

There are as brave, noble and self-sacrificing hearts covered by the garb of a miner as ever throbbed in the breast of a patriot offering himself as a sacrifice for his country's good.

A GOOD ARRANGEMENT.—The mills on the Carson river, along about Empire, says the *Enterprise*, have for some weeks been running to their full capacity. They have been enabled to do this through the ranchmen turning back into the river the water that has been used to irrigate their lands. Once the crops on the ranches have matured there is no special need of the water; but heretofore it has been allowed to course through the ditches and spread out on the flats and other waste places. This year the millmen called upon the ranchers and represented the case to them. The result has been that the mills have been able to run to their full capacity much earlier than usual.

THE copper interests in Southern Utah are looking up, and we may expect a large product of metal from that locality in the near future.

CHICAGO **FRASER & CHALMERS.** ILLINOIS

MANUFACTURERS OF IMPROVED AND APPROVED FORMS OF

MILL AND MINE MACHINERY.

Having made extensive additions to our Shops and Machinery, we have now the LARGEST and BEST APPOINTED SHOPS in the West. We are prepared to build from the Latest and Most Approved Patterns,

QUARTZ MILLS

For working gold and silver ores by wet or dry crushing. The Stetefeldt, Howell's Improved White, Bruntou's & Bruckner Furnaces, for working base ores. Rotary Dryers, Stetefeldt Improved Dry Kiln Furnaces.

SMELTING FURNACES,

Water Jackets, either Wrought or cast iron, made in sections or one piece, either round, oblong, oval or square. Our patterns most extensive in use. SPECIAL FURNACES FOR COPPER SMELTING. Slag Pots and Cars, improved form. Bullion and Copper Moulds and Ladles, Litharge Cars and Pots, Cupel Furnaces and Cars.

HOISTING ENGINES

Large or Small for flat or round rope. Double Cylinder Engines, from 6x10 to 18x60. This latter size furnished J. B. Haggin for Giant and Old Abe Co., Black Hills also Corliss Pumping Engines, 26x60, for Hoisting and Pumping Works, for 2,000 feet deep. **Baby Hoists for Prospecting, 4 H. P. to 6 H. P.**

Wire Rope, Safety Cages and any Size and Forms of Cars. **McCaskell's Patent Car Wheels and Axles—Best in Use.**

Principal Office and Works, Fulton and Union Sts., Chicago, Illinois. New York Office, Walter McDermott, Manager, Room 32, No. 2 Wall St.

Frue Ore Concentrator, or Vanner Mills.

Coarse Concentrating Works, Improved Jigs, Crushing Rollers, Sizers, Trommels, Rittenger Tables, and all other adjuncts for the proper working of Gold, Silver and Copper Ores, complete in every detail.

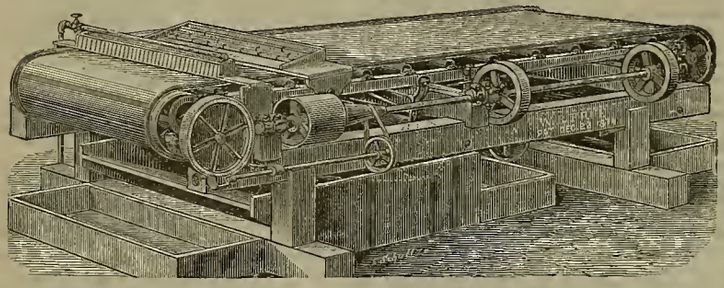
HALLIDIE IMPROVED ORE TRAMWAYS. We refer to Gen. Custer mine, Idaho, 5,000 feet long; Columbus Mine, Col., 4,750 feet long; Mary Murphy mine, Col., 5,000 feet long, all in constant operation.

LEACHING MILLS,

Improved Corliss and Plain Slide Valve Meyer's Cut-off Engines.

CORLISS ENGINES from 12x36 Cylinders to 30x60. PLAIN SLIDE VALVES from 6x10 to 36x36. BOILERS of every form, made of Pine Iron Works C. H. No. 1 Flange Iron, or Otis Steel. Workmanship the most careful. All Rivets Hand Driven.

$1,000 CHALLENGE!



THE FRUE ORE CONCENTRATOR.

Nearly 300 are now in use, giving entire satisfaction. Awarded First Premium and Silver Medal at the Industrial Fair for 1880 of the Mechanics' Institute of San Francisco, Cal.

Saves from 50 to 100 per cent. more than any other Concentrator in use, and concentrations are clean from the first working. The wear and tear are merely nominal; water required is less than in any other wet Concentrator; the power required per machine is less than one-half horse power; the labor required is light, one man on a watch can attend to sixteen machines.

We challenge any other Concentrator in use for a fair and impartial competitive trial, side by side, for stakes of $1,000 each, and we mean business.

☞A machine with all improvements can be seen in working order and ready to make tests, at the office of Hockley, Spiers & Hayes, 220 Fremont street.

MINING MACHINERY A SPECIALTY.

Our manufactures of mining machinery embrace every kind of machine and appliance for the mining and reduction of ores.

We have had an experience of more than twenty years in the manufacture and practical operation of mining machinery in Colorado and the neighboring States and Territories.

Our facilities are superior to those of any manufactory in the West, our works having been recently rebuilt, greatly enlarged and completely equipped.

We invite the investigation of mine owners and mill men seeking machinery. We can furnish, on board, at our works, or set up at the mines anywhere in the Rocky Mountain region, on short notice, the following machinery: Cornish Pumps, Steam Pumps, Stamp Mills for Wet or Dry crushing, Pans, Settlers, Agitators, Retorts, Bullion and Ingot Moulds, Reverberatory Furnaces, Bruckner Cylinders, Revolving Roasting Furnaces and Dryers, Melting Furnaces, Concentrating Machinery, Rolls, Crushers, Conveyors and Elevators, Ore Samplers and Grinders, Hoisting Engines, Water Jacket Furnaces, Slag Pots and Cars, Lead Pots and Ladles, Blast Pipes and Water Tuyeres, Blowers, Cupels for Furnaces, Market Kettles, Wire Rope, Cages, Buckets, Skips, Ore Cars, etc. Estimates furnished and prices quoted on application. Send for illustrated catalogue.

Contains no Nitro-Glycerine or Chlorate of Potash, and is the only High Explosive Manufactured in America that does not contain these Dangerous Ingredients.

In Use for Seven Years Without a Single Accident.

TONITE POWDER CO.,

No. 310 California Street, - - - SAN FRANCISCO.

HYDRAULIC GRAVEL ELEVATORS,

For working flat gravel mines that have no dump.

Sluices gravel and water up hill on an angle of 45°, and will run any kind of gravel that will run in a flume. Handles rocks as easy as fine dirt, and will raise as much material as the water will carry off in a flume on 6 inches grade to 12 feet.

No bedrock cuts, tunnels or drains required. Machine a sufficient drain itself, and the process of mining the same as any other hydraulic mine. Is now a practical success in various places in California and Oregon. Send for descriptive circular to

JOSHUA HENDY.

No. 51 Fremont Street, Office of the Hydraulic Gravel Elevating Mining Co., S. F.

NOTICE.

The old firm of MOREY & SPERRY, Manufacturers and Dealers in Mining Machinery, having been dissolved, a partnership has been formed between Eugene Sperry, Dudley S. Steele and Nathan W. Condict, Jr., under the firm name of SPERRY & CO., to continue the manufacture of and dealing in all kinds of Mining Machinery and Supplies for Mills and Mines.

MR. JAMES A. SPERRY, formerly of the firm of Morey & Sperry, whose experience extends over a period of 33 years, commencing in California in 1849, and embracing the western and southern sections of the United States, as well as Mexico and South America, will personally superintend the construction of the Machinery, and when desired, the erecting and starting of the same upon the ground.

The Machine Works and Foundry of MESSRS. STEELE & CONDICT in Jersey City will be especially at our service in filling orders, and we feel confident that our facilities will enable us to fill orders understandingly, promptly and at reasonable prices. Information and estimates will be cheerfully given.

SPERRY & CO.,

Office, 95 Liberty Street, New York City. Works, Jersey City, N. J.

PATENTS AND INVENTIONS.

List of U. S. Patents for Pacific Coast Inventors.

From the official list of U. S. Patents to DEWEY & Co.'s SCIENTIFIC PRESS PATENT AGENCY, 252 Market St., S. F.

FOR THE WEEK ENDING SEPTEMBER 26, 1882.

265,005.—COMBINED SULKY PLOW, HARROW, SEEDER AND ROLLER—Daniel G. Beaty, Olympia, W. T.

265,014.—DOG CART—Edward Bowman, Santa Cruz, Cal.

264,931.—EXERCISING BALL FOR GYMNASTS—H. B. Cook, S. F.

264,932.—APPARATUS FOR TEACHING MUSIC—Henry F. Courter, Gilroy, Cal.

265,032.—GRATE BAR AND FURNACE—Wm. H. De Valin, San Rafael, Cal.

264,944.—OVERALLS—M. Greenebaum, S. F.

265,005.—CAR COUPLING—F. M. Hazleton, Red Bluff, Cal.

264,948.—STREET CAR—Samuel Howe, Oakland, Cal.

264,949.—TRUCK—R. D. Hume, S. F.

264,950.—DREDGING APPARATUS FOR BARS—R. D. Hume, S. F.

265,087.—MIDDLINGS PURIFIER—John D. Hurst, Salem, Oregon.

265,102.—DITCHING PLOW—C. O. and A. Kirkpatrick Bridgeport, Cal.

265,161.—PRUNING IMPLEMENT—F. O. Slanker, Pomona, Cal.

264,975.—WATER METER—R. T. Van Norden, S. F.

264,915.—DERRICK NET FOR STACKING—Geo. Williamson, Acampo, Cal.

265,004.—CHURN—Henry Have, Bridgeport, Cal.

264,879.—NAPKIN HOLDER—Jas. Hugill, Woodbridge, Cal.

NOTE.—Copies of U. S. and Foreign Patents furnished by DEWEY & Co. in the shortest time possible (by telegraph or otherwise) at the lowest rates. All patent business for Pacific coast Inventors transacted with perfect security and in the shortest possible time.

Notices of Recent Patents.

Among the patents recently obtained through Dewey & Co.'s SCIENTIFIC PRESS American and Foreign Patent Agency, the following are worthy of special mention :

DREDGING APPARATUS FOR BARS.—Robert D. Hume, San Francisco. No. 264,950. Sept. 26, 1882. This invention relates to an apparatus for dredging or clearing away bars, such as most frequently form at the mouths of harbors, estuaries, and the mouths of rivers which empty into the sea. Many useful small harbors and river mouths upon the coast are obstructed by bars which would not warrant removal by expensive means. These bars form at various distances outside, or just at the mouths of the harbor or estuary, and in many cases these estuaries are so turned as to run parallel with and just inside the beach before discharging into the sea. This inventor uses a drag of any suitable shape, size and weight, but preferably of an egg shape, and armed with knives, spikes, teeth, or any suitable projections which will dig into and loosen up the material. This drag, when the water is shallow, or the distances between the anchorages of the ends of the cable considerable, may be connected directly with the cable; but if the water is deep, or the cable is short, it may be found preferable to employ a supplemental connecting rope or cable. The cable or rope extends outward from the bar to a suitable distance, and passes around a pulley or drum, which is anchored according to the character of the place. If a rough open roadstead, the pulley may be fixed to a support, which is anchored so as to be held firmly in place, and at the same time keep the pulley sufficiently raised from the ground to prevent its being covered with sand, or otherwise fouled. From this pulley the rope or cable passes inward toward the shore and around a driving pulley or drum, which is connected with an engine. This engine is supported in various ways. If the bar is distant from the shore, or if it is otherwise not feasible to have the engine ashore, a barge may be anchored in the proper position, and the rope then passes around the pulleys, having the drag connected with one part of it; so that by rotating the driving-drum in one direction, and then the other, the drag will be moved back and forward across the bar, gradually cutting it away, so that the tide or current will carry it away. In some cases, when a single channel has been cut, the sides will wash away without further resistance; but if the bar is rough, it may be necessary to move the engine-barge, or the outer anchorage, or both, so that the drag can be operated across the bar from end to end. When the interior conformation of the harbor or estuary permit it, the engine may be mounted upon a rock, an island opposite the mouth, or, if too wide, upon the shore opposite the mouth. In the latter case a railroad may be laid, having a curve or radius of which the outer anchorage is the center. Upon this railway a car is placed, having the engine and driving-drum mounted upon it. This car may then be moved along the track at intervals, so that the drag can be operated over different portions of the bar from end to end, and thus clear it all away.

TRUCK.—Robert D. Hume, S. F. No. 264,949. Dated Sept. 26, 1882. This invention relates to certain improvements in hand-trucks, such as are employed to transport heavy or bulky packages from place to place in warehouses, or for loading and unloading cars, vessels, etc. It consists in constructing the truck with two front hearing-wheels, having the central portion of the axle bent or curved backward, so as to admit the package between the wheels. A frame, or arch, supported and stayed from the truck, has depending from it two or more hooks, adapted to seize and hold the case or package, when the handles are lifted and the front of the truck depressed. When the handles are brought down, the front will be lifted, and with it the package, which, swinging between the wheels, will be balanced, so as to be transported to any point.

APPARATUS FOR TEACHING MUSIC—Henry F. Courter, Gilroy, Cal. No. 264,932. Sept. 26, 1882. This invention relates to a means for teaching music, and it consists of an apparatus or device for the objective system of musical instruction. This apparatus is constructed with a frame having horizontal moving bars, which are supported and guided by vertical bridges having pins, between which, the horizontal bars may move. These horizontal bars represent the lines of the major scale, and also the intermediate lines which are used in transposing the scale. They are made of such width, relative to the spaces which occur between them, that those spaces which represent a full or whole step, will admit a bar which may represent the sharp of a note below, or the flat of the note above, but where the natural half steps occur, the space is made narrow, so that it will be seen at a glance that no such interposition of a note can be made at that point. The lines and spaces of the ordinary musical staff, with the signature of the base and treble, may be permanently printed upon the side of the frame, so as to correspond with the position of the bars representing the natural scale. In connection with these bars, this invention employs ladders, which represent the natural division of the major and minor scales, these ladders being arranged to be hung upon the bars, so as to represent the various transpositions of the scale, and the bars may be moved forward or back, so as to correspond with the transpositions as shown by the ladder, the bars being differently colored for the respective notes.

Pacific Coast Weather for the Week.

[Furnished for publication in the PRESS by NELSON GOROM, Sergt. Signal Service Corps, U. S. A.]

The following is a summary of the rainfall for each day of the week ending 11:58 A.M. Wednesday, Oct. 4th, for the stations named:

Totals	Wednesday	Tuesday	Monday	Sunday	Saturday	Friday	Thursday	Date.
.1	.00	.02	.1	.1	.00			Olympia.
.1	.03	.45	.53	.1	.00			Portland.
.1	.13	.03	.1	.1	.00			Roseburg
—1	.00	.01	.1	.1	.00			Cape Mendocino.

Reports missing.

Old Papers Wanted.

Twenty cents each will be paid for a limited number of copies of any of the following Nos. of the MINING AND SCIENTIFIC PRESS, if received soon at this office: No. 1, of Vol. 13, 1866; No. 5, Vol. 18, 1869; Nos. 1 and 26, of Vol. 20, 1870; No. 1, of Vol. 22, 1871. Also, 10 cents per copy for Nos. 2, 3, 4, 7, 10, 11, 12, 13 and 15, of Vol. 30, 1875. If any one who has files of back volumes of the PRESS, which they may like to dispose of at a moderate rate, will send us a memorandum of the same and the price, we may be able, sooner or later, to assist in their disposal.

For Sale.

A twenty-stamp steam mill, complete and almost new. Also, air compressors, drills and mining machinery. Anyone having a gold or silver mine warranting the investment, may buy this material on time by making monthly or quarterly payments. Address, CHARLES E. SHERMAN, Havilah, Kern County, Cal.

Attend to This.

Our subscribers will find the date they have paid to printed on the label of their paper. If it is not correct or if the paper should ever come beyond the time desired), be sure to notify the publishers by letter or postal card. If we are not notified within a reasonable time we cannot be responsible for the errors or omission of agents

HOW TO STOP THIS PAPER.—It is not a difficult task to stop this paper. Notify the publishers by letter. If it comes beyond the time desired you can depend upon it we do not know that the subscriber wants it stopped. So be sure and send us notice by *letter*.

IMPORTANT additions are being continually made in Woodward's Gardens. The grotto walled with aquaria is constantly receiving accessions of new fish and other marine life. The number of sea lions is increased and there is a better chance to study their actions. The pavilion has new varieties of performances. The floral department is replete and the wild animals in good vigor. A day at Woodward's Gardens is a day well spent.

SAMPLE COPIES.—Occasionally we send copies of this paper to persons who we believe would be benefited by subscribing for it, or willing to assist us in extending its circulation. We call the attention of such to our prospectus, terms of subscription, etc., and request that they circulate the copy sent.

Agents Now Wanted.

Extra inducements will be offered for a few active canvassers, who will give their whole attention (for a while at least) to our business. Apply soon, or address this office, giving address, age, experience and reference.

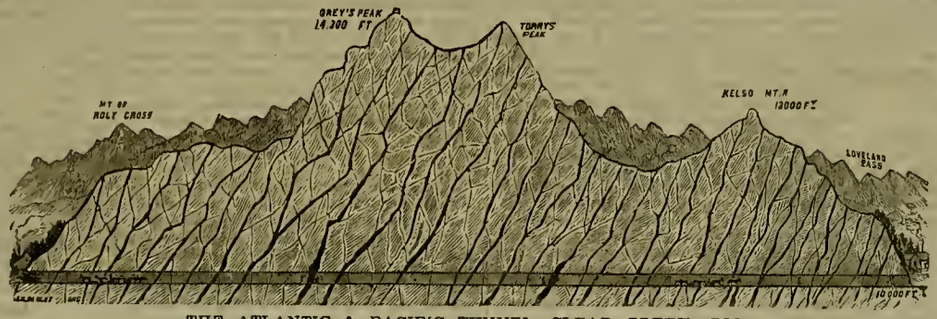
SAN FRANCISCO, SATURDAY, OCTOBER 14, 1882.

VOLUME XLV Number 16

An Important Mining Tunnel.

We give herewith a sectional view of an important mining tunnel now in process of construction in Clear Creek county, Colorado. Work upon this tunnel was commenced in the summer of 1880 by a company known as the Atlantic-Pacific Tunnel Co., of which M. M. Pomeroy, of Denver, is president. As its name implies, this tunnel is designed to pierce the summit of the Rocky mountain divide; to accomplish which, at the level started, will require a length of 25,200 ft. The design of the enterprise is to open up, at great depth, certain mines which are worked upon the surface, and which, it is believed, will be found to continue and increase in value to a depth even far below that at which they will be intersected by the tunnel.

The eastern end of the tunnel commences at the foot of Kelso mountain, which, with Torrey's and Grey's peaks, forms, at this point, the backbone of the Rocky mountain divide. The locality is about 60 miles due east from the city of Denver. There is a railroad now running within 10 miles of the east end of the tunnel, with a graded track to a point some eight miles nearer, at which point it bears off to the westward and crosses the divide through Loveland pass, as shown in our illustration. After crossing the divide it follows along the western slope of the mountain and approaches about as near to the western terminus of the tunnel as we have already shown it does to the eastern. This tunnel, when complete, will have the very best facilities for transporting its output of ore or bullion.



THE ATLANTIC & PACIFIC TUNNEL, CLEAR CREEK, COL.

The tunnel will pass nearly under the center of Grey's peak, at which point it will reach its greatest distance from the surface—3,425 ft. The elevation of the various peaks above the level of the sea is given in the diagram. The first silver discovery in Colorado was made near Kelso mountain, and not far from the eastern terminus of this tunnel. The first important gold discoveries were made near Idaho Springs, in the summer of 1858, and along the line of the railroad already referred to.

The eastern end of the Atlantic-Pacific tunnel has now been extended about 1,500 ft. It is 10 ft. wide by 9 ft. high. No timbering is required except for a few feet at the commencement. Work has also been commenced for its western terminus. The waters from the eastern entrance flow to the Mississippi; those from the western find their way into the Colorado. Work is continued night and day without ceasing. An Ingereoll drill is employed, driven by compressed air, the power being derived from a steam engine, placed at the mouth of the tunnel. A second drill is soon to be put in operation. All the machinery is first-class, and the work in the tunnel is well done, under the management of Messrs. I. D. Jennings and Jonas Washburn, who are doing the work by contract.

The tunnel is considered a very important and promising enterprise. It can scarcely fail to strike a number of veins, which are already known to be rich near the surface, and which it is confidently believed, will increase in richness with depth. The company owns quite a number of veins, and expects, of course, to strike a number of blind lodes, work upon all of which will be commenced as soon as they are reached.

It is expected that sufficient mineral will soon be obtained from the lodes to pay the running expenses of the tunnel. Until that time, the funds to continue the work will be derived, as heretofore, from the sale of stock, which is sold unassessable. The corporation is allowed to issue 700,000 shares of such stock, which is now selling at $3 per share, with a face value of $10.

There is an abundance of wood upon the hills and mountains immediately adjoining the tunnel, the timber line being in full sight, however, less than 1,000 ft. above. A fine and never-failing stream of water passes directly by the mouth of the tunnel, about 200 ft. below it. This may be considered as one of the most important mining enterprises yet undertaken in the State, and when completed will be the longest mining tunnel on the continent.

Collecting Taxes from Miners.

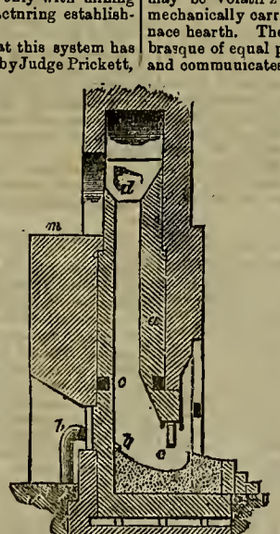
It has become a somewhat common custom in the mining regions for people to expect the mining companies to collect debts for them; that is, without absolutely garnisheeing men's wages. They expect the companies to withhold certain sums, or, at least, to remind the men to pay certain debts. This is, of course, not a universal custom, but it is one observed in many places. Another and more common custom noticeable in this connection, is that of collecting poll and other taxes to which non-property holders are liable through the company; that is, the tax collectors expect employers to collect the taxes of their employes, and turn the amounts over to the officials. In many places on this coast this is done not only with mining companies, but with manufacturing establishments.

It is probable, however, that this system has received a check in a decision by Judge Prickett, of Idaho. One of the Wood River papers says that the practice referred to has caused a great deal of ill feeling, and last summer this ill feeling found expression at Bullion in the refusal of the miners employed there to permit the amount of the poll and hospital taxes to be deducted from their wages. The mine owners, acting upon the advice of Jamee H. Beatty, refused to collect the taxes, and an agreed case was made up and submitted to Judge Prickett at the last term of court, Mr. Beatty appearing for the miners and mine owners, and District Attorney Hawley for the Tax Collector. Mr. Beatty contended that the law under which the Tax Collector is acting is unconstitutional. Judge Prickett decided in favor of the mine owners, and against the Tax Collector. The decision is undoubtedly sound law, but it will cause a radical change and great loss to the treasuries of the various counties in Idaho. It is said that the lose to Altoras county for this year alone will not be less than $30,000. It seems, however, as if the taxes could be collected from the individuals by the officials without turning their work over to the companies to do it for them. At all events, the miners will get their money in their hands, and not have it paid out for them by others.

A NARROW-GAUGE railroad is to be built from Bucksport, Humboldt county, to the nearest point on Humboldt Bay.

Lead Smelting in Silesia.

At Tarnowitz, etc., in Upper Silesia, the method of smelting silicious lead ores in blast furnaces, employing iron as the reducing agent, with charcoal, coke or coal as the fuel, has been employed. But coke is generally preferred as yielding a regulus which is poorer in lead than when charcoal is employed, while affording a greater yield of metal, with a shorter duration of the smelting operation than when coal is used as the fuel; but with the introduction of more perfect blowing apparatus, coal has been adopted. The furnace employed is formed of an inner lining (*a*) of fire-brick enclosed in an outer wall of common brick; the furnace is supplied with one inclined twyer (*b*), situated at the back of the furnace, and at about 15 inches above the level of the fore-hearth. The hearth and shaft (*c*) are rectangular in section to the hight (*d*), where it becomes circular, and communicates with a series of chambers for the condensation and collection of any fumes that may be volatilized, or of arresting particles, mechanically carried by the blast from the furnace hearth. The hearth (*e*) is composed of a brasque of equal parts of clay and coke dust, and communicates with the fore-hearth by an opening or eye, through which the slags are drawn off; while a communication is made with the bottom of the hearth for tapping out the metal and regulus into seperate receptacles placed in front, the tap-hole being closed by a plug of clay, except when drawing off the metal.



Blast Furnace for Lead Ores.

The mixture of ore, fuel, flux, etc., is introduced from a platform (*m*), through an opening near the top of the furnace shaft; the charge consisting of about 100 parts of raw ore, with 12 to 15 parts of cast or scrap iron, from 12 to 14 parts of iron slags or forge scales, and about 30 parts of lead slags; a charge of these proportions requiring for emelting about a ton of coal per ton of ore.

The furnace is charged or fed by throwing the ore mixture against the back side of the furnace, while the fuel is introduced towards the front; the effect of the distribution of the materiale in this manner being to form a slag-prolongation or nose upon the end of the twyer, and which prolongation, according to its length, affords a dark or bright eye or opening at its end, by which the workman is enabled to observe the working, and adjust the charges to the requirements of the furnace; thus, if the temperature falls, the nose becomes longer and more nearly closed at the end, the "eye" becoming accordingly less luminous, indicating thereby, that the burthen is too heavy, *i. e.*, that there is an excess of ore to fuel in the furnace charge, while on the other hand an excess of fuel in the charge burns away or melts the nose, affording a brighter "eye," and causes the temperature near the front wall to be lowered, owing to imperfect distribution of the blast by the shorter nose, whereby slag, etc., adheres to and forms accretions on the front wall, impeding the proper descent of the charge.

As above stated, the products of smelting in this furnace are a rich lead, which is at once treated for the extraction of its silver; secondly, a regulus of ferrous sulphide produced by the reaction of the iron upon the plumbic sulphide in the separation of metallic lead, and which regulus also contains more or less undecomposed plumbic sulphide with a little silver, along with smaller and variable proportions of other metallic sulphides, such as those of copper, zinc, antimony, nickel, manganese, etc., this regulus being treated for the extraction of its lead and silver by roasting and subsequent treatment as a roasted ore in the blast furnace, while, lastly, there results a proportion of slag, containing variable amounts of lead, and which is classed as clean slag, if containing only about 2% of lead, and is then thrown away, or, if it retains upwards of 6% of metal, the slag is called unclean, and is again smelted, either alone or as part of a subsequent furnace charge, serving thereby to give the required fusibility in the treatment of the richer ores of the district. The low-blast furnace described above was employed in the smelting of such rich ores as occur in fragments, and contain from 75% to 80% of lead, while the poorer ores, and the schlich or slimes from the first-mentioned ores, were smelted in the high-blast furnace; but the method of smelting in the blast furnace has been largely superseded at Tarnowitz by the method of reduction in the reverberatory furnace. The Silesian low-blast furnaces work continuously during 8 or 10 days, when it is found necessary to stop the smelting, in order to repair the interior of the furnace.

THE bullion products from the southwestern portion of Nevada's domain will, in the near future, "warm and creak" the axles of the little narrow-gauge Carson & Colorado road, which happens to have been built in the right time and right place. The mine owners of Gillis Mountain mining district hope soon to gain some relief by the erection of a 5 or 10-stamp mill in near proximity to their mines. The Hon. J. R. Benton, one of the solid men of Luning, has taken the matter in hand, and the probabilities are that in the very near future the mill will be doing honest custom work.

THIS is what the Salt Lake *Tribune* thinks about it: "Parties in from Colorado say that the Centennial State has been advertised beyond her resources, while Utah's wealth in minerals, agricultural and other natural advantages, have not been half made known to the world, and that we may look for a boom to come from our exhibit at the Denver exposition. People are just beginning to comprehend that of all the great mountain region of the West, Utah, in climate, soil, minerals, etc., is superior to any."

THE product of the Ontario, Utah mill from Sept. 21st, to and including the 30th, was $46,139.66, making a total of $173,040.32 for the month. The mill has been running short some days, and was shut down on the 29th for cleaning up and repairs, 10 or 12 days. The total output of bullion from January 1st, 1882, to October 1st, amounts to $2,061,851.38.

MR. L. L. WOODMANSEE has started on a trip through Nevada, in the interest of this paper, and we hope our friends will aid him by furnishing items of interest for publication.

THE copper smelting furnaces of Soda Springs, Nevada, are constantly turning out metal ingots by the carload. There are very many rich copper mines in the vicinity.

Honest Mining.

An Addreee on the Subject.

Tbos. J. Manning, who has been elected President of what is called the "National Mining Association," at Dsnver, Colorado, in delivering his inaugural address, said:

Gentlemen of the National Mining Association: I shall effect no concealment—from yourselves, at least—of an honest pride in accepting the office conferred upon me hy your votes of yesterday. Responsible and onorous as its duties may be, I confess they are in the line of my ambition, and shall enter upon them with an earnestnsss of purpose and sincerity of faith which I trust may compensate, in some measure, for any lack of experience or natnral ahility. I thank you for the honor conferred, and pledge my utmost effort to merit it.

On the other hand, let me express my confidence in you, with the hslief that none of you intend this honor shall he a harren one. I trust that, with every ballot for President, has gone a silent pledge of that hearty and sustained cooperation in work, without which, neither purpose nor faith, experience nor ahility in the chair, could he of much avail.

The work we have undertaken, gentlemen, is new in its application here, however old in principle. It is in natnre reformatory, and, like all movements of reform, it is likely to meet infinite opposition and difficulty in the start, however triumphant in the end.

There is no denying the fact that, in connection with tbe business of mining for the precious metals, there has grown np a system of deception, triokery and fraud, which threatens to overshadow and paralyze the industry itself. Marvelous as has been the expansion of that industry, and wonderful as have heen the results, the system spoken of has expanded even more rapidly, until, like the cloud gathering about a mountain, it not only eclipses with its vaporous suhlimity the solid grandenr, but makes all men who have not stood upon the mountain, doubt, for a time, at least, whether tbe whole is not a cloud.

I do not believe there is anything in the nature of mining itself, as distinguished from other industries, to account for this. The explanation must he found in its sudden and phenomenal growth. To push the metaphor just used, we may say that, about a mountain suddenly raised as by volcanic energy from the plain or sea, vapors most dense and obscuring may be expected to gather.

Discarding metaphor and analyzing the facts more closely, we see that the growth of an industry ordinarily depends upon its profits. The profits of intelligent mining since the discovery of gold in California have hesn enormous, hut the growth of the business has even outrun its profits. The latter were visible—not to be concealed. Almost every community in this country and in England could show instancss of wealth rapidly acquired or increased through mining. This attracted, or drove to the same fields, thousands who, without intelligence—with no understanding whatever of the factors involved in the mining problem—hoped through sheer "luck" to make or increase their own fortnnes in the same wonderful degree. Ignorance or business principles and faith in luck go hand in hand, and together they create the very atmosphere in which, of all others, the tricksters, the gamblers, the confidence man, the swindler and the unscrnpulous "operator" of every name is most at home.

The conseqnence has been that here in the Rocky mountains—the field of present success in legitimate mining—has also been presented the most inviting field ever opensd on the earth for the whole hrood mentioned above.

I have no time to describe these men, their methods or their games, or is it necessary. Every mining camp in these mountains, from Alaska to Guatemala, has furnished, or can furnish, its "hright and shining" examples. It is enough that you all recognize the fact of their existence and activity, and the necessity of some movement that shall counterset their efforts and prevent the immeasureable injury they are inflicting upon an industry in itself as useful, as honorahle and as heneficient as any under the sun.

Such a movement you have here organized. The constitution you have adopted expresses in its preamble the motives which actuate, and the spirit which should govern us in osrrying forward that movement. Without egotism, let me say that I regard the large and wholly unsolicited vote cast for me on yesterday, after the adoption of that plank, as a special and most grateful compliment to myself, hut with greater satisfaction as a pledge of your own devotion to that principle in onr work.

Let our motto be, "Service to the mining industry such as truth alone can give," and let us stand hy our motto to the triumphaut end.

The means to be employed are various, and will doubtless multiply as we proosed. Among those immediately suggested, I would speak of the following as of special promise and importance:

1. Gathering Statistics—Much as statistics have been derided and their evidence made light of, there is no more reliable means for reaching correct conclusions upon many points of the greatest importance. Statistics, like other figures, can lie, or rather can be made to serve the liar's purpose. Correct statistics, honest statistics, however, do not lie. They are among the most truthful and reliable of all sources of information. It is the collection and preservation of such statistica that we must endeavor to promote. A few facts—so they be facts—gathered in each mining camp or community, when put together, make a table of great value, and this value increases with eacb increase in number of the facts of that particular order, until in the course of time it becomes inestimable.

2. The founding of museums or collections of specimens and material illustrative of the special resources of our various sections. These should be both permanent and movable—the latter in shape for ready transportation to desirable points for exhibition, and of a character adapted to snch purpose. Such being formed in all the counties would form an attractive feature at local fairs and exhibitions, and no such Herculean labors as attended the inauguration of the National mining exposition would attend our future ones. I trust each one of you may he found active in this direction in your respective fields.

3. To promote legislation in furtherance of our aims. Laws are necessary in many of the States and Territories to enable county commissioners to appropriate funds in aid of such work, as, for example, the last mentioned, founding museums, etc. Only this hint is needed to indicate all I would say on this point did time permit.

4 I regard the discouragement of all reliance upon "assay values," and the substitution of "mill returns" with full statement of amounts of ore run, in estimating the worth of property as a fundamental necessity, if we are to reach an honest basis in dealing in mines.

5. The placing of purely fictitious value upon mining property, however good, through stocking the same at enormous figures, and placing the stock upon open market at a price greatly below par, should be steadily and firmly discountenanced hy every one of us as among the tricks of a cunning and unscrupulous class, who are neither honest miners nor friends of honest mining, but gamblers, who seek to make money without giving to the world any honest equivalent whatever. Their stock in trade is the credulity of the ignorant and the excited hopes of the avaricious.

6. We must, in every camp, put forward those properties which are best and of surest promise, leaving the poor and doubtful to take care of themselves. Capital invested in a good mine is sure to succeed, and every successful investment adds credit to a whole district, promoting its prosperity in every way. On the other hand, no matter how much capital is expended on a bad mine, nothing hut failure can result, and every failure throws a pall of discouragement over the whole camp, thus preventing further effort there, even npon prospects of real merit.

And last, though not least, there should he cultivated in all we do, as well as in all our deliberations, a unity of purpose and a spirit of generous co-operation which knows or recognizes no geographical boundaries or lines of separation, political or sectional. Each member of this association should represent the mining interests of the mining people of this continent, and frown, as I shall surely do, upon every effort to favor any person or property because they hail from his own particular neighborhood We are a National assooiation, and our name should be spelled with a big N.

As for mines, if we mean anything, we mean that they shall, so far as we are concerned, stand or fall not upon locality, but upon merit. For myself, I long to see the day when no man will inqnire whether a mine is in Colorado, or Wyoming, or Utah, or New Mexico, California, Nevada, Oregon or New Jersey, hut only what are its merits, advantages and well-founded claims to confidence as a producer of bullion.

There are many other points that I would gladly mention, hut have already detained you too long, and will only pause to express my bope that the time will come when, through the intelligence and unswerving honesty of our conduct of affairs, the sanction of this association will be coveted hy, if not necessary to, every mining transaotion of importance on this continent.

Cinders in the Eye.—Persons traveling by railway are subject to continued annoyance from the flying cinders. On getting into the eyes they are not only painful for the moment, but are often the cause of long suffering that ends in a total loss of sight. A very simple and effective cure is within the reach of everyone, and would prevent much suffering and expense were it generally known. It is simply one or two grains of flax seed. These may be placed in the eye without injury or pain to that delicate organ, and shortly they begin to swell and dissolve a glutinous substance that covers the ball of the eye, enveloping any foreign substance that may be in it. The irritation of cutting the membrane is thus prevented and the annoyance may soon be washed out. A dozen of these grains stowed away in the vest pocket may prove in an emergency worth their number in gold.—*Western Rural.*

We are informed that the Carrie Copper mining company has been reorganized, and a new stock company formed with strong financial backing, and that the indebtedness of the old company has been entirely psid off. Some of the stockholders will be in Globe in a few days to start work on the mine and thoroughly prospect it. They will also arrange for the starting of the company's furnace, that has so long lain idle in the northern part of town. And still they come. In the course of six months we expect to see, in the outskirts of Globs, fully eight active furnaces.—*Globe Chronicle.*

A Mammoth Industry.

How Representative Hydraulic Mines Make and Spend Money.

Among the many large hydraulic mines of Nevada county, says the *Transcript*, perhaps the general reader knows as little concerning the operations of the Milton and the Malakoff claims as of any others. They are both "close corporations," conducting business on the same general principles that a wise mercantile or manufacturing firm would. There is no stock on the market, the owners being mainly residents of this State who hold their interests for the legitimate profits to be derived therefrom.

The writer, during a recent visit to the upper part of the county passed along the line of these companies' workings, and will give in the briefest possible space a report of what he saw there.

Bowman Lake (belonging to the Malakoff) has a capacity of 7,000,000,000 gallons, and Milton reservoir (owned hy the Milton company) of 4,500,000 000; besides which are five smaller, but nevertheless important lakes belonging to the same properties. To convey water from these to the mines are lines of ditches aggregating 150 miles in length. These seven lakes and all the ditches cost in round numbers $1,500,000 to construct, and $70,000 per annum to maintain. They are among the greatest marvels of engineering skill that the world can hoast, and neither has expense been spared nor the teachings of science and past experience heen avoided in the effort to make them lasting and to secure perfect safety to the country below them. The stone dams are practically indestructible, and although some of them have now stood for two decades, more or less, we have yet to record signs of weakening in any of them, to say nothing of a break never having occurred. The ditches winding down from the sources of supply traverse some of the ronghest country to be found in California's mountainous regions. Through almost bottomless gorges, along the backbones of sharp ridges, and sometimes in wooden flumes that are suspended by chains along straight-faced, beetling crags 300 ft. above the base and almost as far from the summit, then in iron pipes across threadlike trestles as high as the tops of the giant trees that stand in the vales, to be crossed, the water, in streams large enough to float good-sized boats, rushes from the fastnesses of the Sierras down into the foothills of this county, where it is used in washing from the dead river channels the countless millions of gold that has accumulated there during the past ages, and the harvesting of which for the world's enrichment has but just hegun as yet.

The Annual Expenditure

Of $70,000,000, required to keep in repair this great system of reservoirs and canals, is in no measure met by the sales to ranchers, and is never likely to be, as the owners calonlated upon when projecting their schemes. There is no farming or vine-growing land dependent on their ditches, and what little water they can manage to dispose of for domestic purposes, and to other hydraulic miners in the region traversed, realizes so insignificant a sum that it is not worth considering. Therefore, everything has to depend on the mines for the benefit of which the improvements were originated; and should those minss fail for any reason to become productive, the whole water system would naturally go to ruin.

The Milton and Malakoff companies, together, employ regularly 400 men (all white), a majority of whom have families, and the wages range from $2.50 per day of 10 hours, upwards, according to the experience of the employe, and the nature of his work. Operations are carried on night and day all the year around, electric lights being nsed when the sun sinks below the horizon. Pitch-pine fires were formerly kindled to

Furnish Light at Night-time,

But electricity is now made to serve the end to infinitely greater advantage and at a much less cost.

The two mines produce annually about $1,000,000.

These and the other hydraulic mines on that ridge are the principal support of the towns of Eureka Sonth, Moore's Flat, Relief Hill, Lake City, Columbia Hill, North Bloomfield, Cherokee, North San Juan, Sebastopol, Sweetland, French Corral and Birchville. They are all furnished with fine school-houses, costing upwards of $30,000, and most of them hoast one or more large churches each. They have handsome public halls, Lodges and societies in great number, good hotels, thrifty business firms by the dozens, and all the other concomitants of an advanced civilization.

A Fallacy Exploded.

It has heen a pet argument of such authorities as the *Bee* and the *Appeal* and their allies that the cessation of hydranlic mining would, if brought about, he followed with the working of the auriferous chsnnels by the drift process, which would give employment to a largely increased force of lahoring men, keep up the regular output of hullion, and be less profitable to the owners only. They hold that by such a change the mines would prodnce as much gold as by the present method, only heing exhausted less quickly. Snch reasoning will not hold good in tbe face of the facts. Drifting is practicable only in snch channels as the Bald mountain of Sierra county, where the gold is concentrated within a few feet of bedrock; whereas the channels of Nevada county range from 100 to 500 ft. in depth, and the gold is scattered all through them. We do not know of a drift mine in this county that has paid, excepting in small spots, and even these have heen the exception. Only 20% of the gold in a olaim is ordinarily realized hy drifting, while it can all be saved hy the hydraulic method. Again, the North Bloomfield company, for instance, has worked out half a mile of its three or four miles of ground, expending for labor in that distance the sum of $800,000. That much would bave been drifted in less than half the time, and not more than $350,000 would have heen realized as the gross yield.

The Cannon Ball Quartz Crusher.

The Downieville *Messenger* gives a description of the new Grass Valley invention known as the Dyer Cannon Ball Quartz Crusher. One of the machines is now in use in the Jim Crow mine in Sierra county. Including a heavy water wheel, it weighs only about 5,000 lbs., any single piece of which can be packed on a mnle. There is tbe hed-plate of chilled iron about three feet in diameter, around the outer edge of which is a shallow groove. In this groove travel 20 chilled-iron balls four inches in diameter. Resting on these halls and holding them down is a heavy ring of cast iron about three feet high and several inches thick, in the lower edge of whicb there is a groove corresponding to the groove in the bed-plate. In the center of this ring is a hub fast on a spindle which runs in a step. Between the hub and the inner surface of the ring is a space of about four inches at the top, contracting towards the bottom to a narrow opening immediately over the halls. Both the outer ring and the inner hnb are driven at tbe same rate of speed by suitable and simple gearing bsneath. Between the hub and ring the quartz is crushed to any desired fineness before it can reach the balls running in the groove below. To make this simple contrivance act as a quartz crusher, the spindle on which the hub runs is set out of line at the top, which leaves the opening hetween tbe bnb and ring at the top abont six inches on one side and four inches on the other. Into the larger opening is fed the quartz, which is carried around as the machine revolves, and thoroughly crushed. A circular screen is used, the pulp heing delivered to a recepticle whicb discharges on either side, whence it runs to the plates and blankets. There is, as yet, no amalgamation in the hattery, hut the inventor thinks he csn so arrange it that that can he affected.

The mill is driven hy a "Taylor" wheel, four feet in diameter; the inventor is M. C. Taylor, of Grass Valley. About 30 inches of water under 125 ft. head furnish ample power to drive the mill. The wheel is of the "percussion style," consisting of a series of curved buckets about 18 inches long hetween rims. It takes the water from a circular nozzle, at one side and discharges at the other. The whole is a solid casting. It is said that the mill will crush 10 tons in 24 hours.

Idaho's Advancement.

The rapid strides that Idabo is making toward becoming the leading mining section of the West, is hardly realized hy her own people, and not known to outside investors or mining men. Eastern companies have been steadily investing in her mines, and a great deal of machinery has heen erected within the past few years. In districts, five years ago known only to the wild beasts of the forests and a few hardy mountaineers, towns have sprung up, and the sound of the steam whistle is a sign for hundreds of mechanics, miners and laborers to go to or leave work. Three mills will be osst for Atlanta alone this winter—one 30 and two 20-stamp. These, in connection with two already running there, will give employment to hundreds of miners; business will become brisk, the little town grow to large proportions and support a large population. Rocky Bar has two mills running with a good prospect for more next year. In those two camps business is now good, as everybody is doing something, and the mines making money. Here, in the upper Wood and Salmon River countries, we have a smelter and two stamp mills, with a fair prospect for two or three more next year. At Ketchnm and Muldoon the smelters are capable of reducing the ores, and tbe numher of rich mines is very numerous. The copper, gold, and silver mines of the Weiser are also attracting unusual attention, as well as those of Boise hasin and Owyhee county. To substantiate our declaration that the mines of Idaho Territory are the best on the coast, there is nothing more than a reference to the hullion products of the mills and smelters necessary. The Custer, near Bonanza, is the greatest producer on the coast for the number of stamps employed, having yielded $60,000 profit for 20 months, with 20 stamps.

When we look over the list of mills and smelters, we can truthfully say that everyone has paid dividends this year, and this most flattering of any State or Territory in the West. It is a decided fact that the amount of machinery now in operation is not half what it will he next year.

Idaho is rapidly increasing in permanent population and advancing toward Statehood. The time is not many years ahead when we will add another star to the flag of this, the greatest nation on earth.—*Vienna Reporter.*

The messenger boys of the Americsn District Telegraph Company, in Chicago, struck Saturday for an advance in wages and a change of managers.

MECHANICAL PROGRESS.

Steel Plates for Boilers.

Some years ago the French Congress of Engineers refrained from rendering a definite decision on the relative value of steel and iron for boiler plates, on the ground that the subject was not far enough advanced to warrant such action. At the fifth congress, however, which recently met in Lyons, the following report was submitted: Two boilers ordered by the Midi company of the Fives-Lille Works burst at the trial, and the company consequently decided not to use steel plates, notwithstanding that Creusot offered every guarantee for its boilers. The Forges et Chantiers de la Mediterrane have likewise excluded steel plates for boilers. Krupp has also given up steel, and the experiments made at the instance of the English Admiralty have shown that steel corrodes more quickly than iron. This corrosion is all the more dangerous, as steel plates are used much thinner than iron plates. Mr. Webb, of Crewe, notwithstanding, still adheres to the application of steel plates for the engines of the Northwestern railway.

The engineers of Rouen also employ steel plates on the ground, presumably, that they would prove more homogeneous in case of overheating. But this advantage is, according to M. Roland, of too small account compared with the great drawback that they are very liable to tear and burst at the ends and in the rivet holes either during manufacture or during use. He cites in support of his views the case of the eight boilers made for the *Lavadia*, three of which burst at pressures of from 3½ to 6½ tons per square inch, resulting in the rejection of all the boilers. The prevailing opinion of the congress was expressed by M. Cornut, who stated that at present steel plates do not offer sufficient safety for the construction of boilers, and that it would be advisable not to employ them. It was further stated than an amount of care would be required in the manufacture of steel for this purpose which few makers would be inclined to exercise, and that the many failures observed in this department of the use of steel must be ascribed to this circumstance.

STEAM WATER WHEELS.—A novel appliance has recently been patented by Prof. Wellner, of Brunn, Austria. It is called a steam wheel, and is described as consisting of a simple water wheel, immersed for the greater part in hot water, contained in a closed vessel. Steam is admitted at the lower part, and forces the chambers of the wheel upward, producing rotation. The steam is introduced in such a manner as to fill only those cells on the rising side, and after a portion of a revolution of the wheel it begins to escape into the steam space above the water. The steem may either be produced directly at the lower part of the apparatus, or conducted to the vessel from suitable generators, and the upper tube for discharging the steam may lead either into the open air, or into a suitable condenser. The mechanical work consists in the ascent of the specifically lighter steam in the heavier liquid, and the apparatus, when connected with an ordinary steam engine, may utilize the exhaust steam. It will be seen that the apparatus embodies no specially new features. Nothing definite has been said about its practical success, and we should imagine that it is rather an interesting toy than a useful and practical apparatus.

MORTAR FOR FURNACES.—It is well known that the mortar made of fire-clay generally used in building metallurgical furnaces has no binding qualities whatever, and serves only to fill the small inequalities between the surfaces of the fire-brick. It is for this reason that engineers insist on thin seams and plenty of water in the mortar. It has been urged recently that the desire to render furnaces absolutely fireproof has led metallurgists to adopt a wrong policy in this respect, and it has been proposed to use as a mortar a mixture of lime, cement or cinder, and sand or clay in such proportions that it will sinter when exposed to the heat of the furnace. Thus fire-brick mason-work may be made to have that solidity which it does not now possess. Of course, it would be necessary with such material to suppress as carefully as heretofore the tendency of the average mason to use mortar as liberally as he does in ordinary brick-work. It is likely, too, that in many instances, with smooth and straight brick, it would be possible to do away with much of the rammed linings which are so troublesome in requiring repairs in many metallurgical operations. The suggestion, we believe, is worthy of attention, though probably more care would have to be bestowed on the steying of furnaces built in this manner.

TRACTION engines are gradually coming more and more into practical use. The use of such engines for hauling logs is just now becoming quite popular in comparatively level lumbering districts. They are beginning to be quite extensively used for such purposes among Southern mill men. Where the nature of the soil and evenness of the ground will permit, these engines seem destined to take the place of all other methods for this purpose, and there is no good reason why they should not.

Terra Cotta Lumber.

An article bearing the name of "terra cotta lumber" has recently been patented and introduced for architectual purposes. As its name implies, it is manufactured from a mixture of clays and vegetable matter. The vegetable matter is introduced and subsequently removed by "burning," the entire mass being "burnt" in a kiln after the usual manner of producing ordinary terra cotta work. The material is intended to be as much devoid of "grit" as possible, so that it may be readily worked into any desired shape or finish by edge tools. The product, besides being of interest to the building public, especially in localities where lumber is expensive, is, moreover, quite novel.

Without going into particulars concerning the manufacture of this article, we will state that the Gillman Porous Terra Cotta Co., with office at 71 Broadway, New York city has commenced its manufacture upon a commercial scale. Its uses are in the way of architectural fire-proofing, boiler and steam-pipe sheathing liquid fuel-holders, fire-proof receptacles, chimneys and chimney linings, furnace linings, grain-storage bins, filters and electrical insulation. It derives its name of lumber from the fact that after the material has been shaped in large pieces, technically known as "logs," they are literally sawed into planks or boards and dimension stuff, in a manner similar to that in which lumber is manufactured. The texture of the material is such that it may be subsequently fashioned in the workshop into such forms and articles as circumstances demand. The material is free from grit and quite tough in texture, and may be worked with edge tools without detriment to the latter.

For work requiring a finish the material is run through a planer, which in design is a slight modification of the machine used in ordinary woodwork. A heavy knife is about the only change required. The texture of the material is such that it will hold screws or nails, thus making it much more advantageous for use than any similar article ever put upon the market. It is well adapted for inside partitions, because what plasterers call a hard finish may be applied directly to its surface without previous preparation. It is also well adapted for purposes of roofing. Its non-conducting properties render it cool in summer and warm in winter. Slate or shingles can be nailed directly to it. The usual sizes of terra cotta lumber as furnished are about 4 ft. long by 9 to 12 inches wide. But almost any sizes can be supplied to order.

OXYGEN IN IRON AND STEEL.—Prof. Lederhur, of the School of Mines, has conducted some interesting experiments concerning the quantity of oxygen contained in various samples of iron and steel, and the results arrived at may not be without interest to our readers. He gives the following examples of the quantity of oxygen in various samples of iron and steel: Oberhausen open-hearth steel, 0.935%; Bochum Bessemer steel, 0.047%; hasic steel, before complete dephosphorization, 0.068%.; basic steel, after complete dephosphorization and before addition of spiegeleisen, 0 111%; Gute Hoffnungshutte wrought iron, 0.515%.

POUNDING in an engine at the end of a stroke, when the crank is on the dead center, may come from a ridge in the cylinder or at the guide-bar end, or from the connecting-rod brasses not being keyed up tight enough. Pounding when the crank is at half stroke will not be caused by any of the above, but will be apt to be occasioned by the crank-pin not being parallel to the crank-shaft, or from one or the other of the crank-shaft journals being low.

WOOD holds a high position as an employing agent. The carpenter trade alone gives employment to nearly three times as many persons as the cotton mills and fully 12 times as many as are engaged in the production of flour and meal.

KINDLING WOOD.—The manufacture of this comparatively new article of commerce is becoming quite an important industry all through the country.

THE AURORA AND THE TELEGRAPH WIRES.—An observer of the remarkable auroral display on the fourth of August last, residing at the time in Mt. Clair, N. J., writes to the *Scientific American*, that on connecting the two poles of his telephone, one with the water-pipe leading to a cistern near his dwelling and one with the gas-pipe leading all over town, he heard the electrical crackle going on substantially the same as is heard when the same connection is made during thunder-storms. He, however, reports that the auroral crackle was more delicate in its sound than the thunder-storm crackle, and that besides the crackle there were, at intervals of perhaps half a second each, separate short taps on the telephone diaphragm that gave a slight ringing sound.

COPPER IN BREAD.—Some time ago Dr. J. Van der Berghe was struck with the constancy of the proportion of copper found in bread, and made an examination of wheat. In 1,000,000 parts of the grain there were 9 24 of metallic copper, and oats yielded 10.8 parts in the same quantity. He made, of course, the usual preliminary tests to ascertain the purity of his reagents, and he took care that his gas burners were made of iron. Even the porcelain capsule was supported on a platinum triangle.

SCIENTIFIC PROGRESS.

Curious Electrical Phenomena on Pike's Peak.

Sergeant L. M. Day, signal officer at the summit of Pike's peak, writes under a recent date as follows: "At 8:45 o'clock this evening, on opening the door, a most curious phenomenon met my astonished eyes. The line on the summit was distinctly outlined in brilliant light, which was thrown out from the wire in beautiful scintillations. On near approach to the wire these little jets of flame could be plainly observed. They presented the appearance of little electrified brushes or inverted cones of light—or, more properly, little funnels of light with their points to the line, from which they issued in little streams about the size of a pencil lead, and of the brightest violet color, while the cone of rays was of a brilliant rose-white color.

"These little funnels of light pointed from the line in all directions, and were constantly jumping from point to point. There was no heat to the light, although it was impossible to touch one of these little flames, for as soon as they were approached by the finger they would instantly vanish or jump to another point on the line. Passing along the line with finger extended, these little jets of flame were successively 'puffed out,' so to speak, to be instantly relighted in the rear. It was a curious and wonderful sight. No sensation was experienced on applying the tongue to the line. Not only was the wire outlined in this manner, but every exposed metallic point or surface was similarly tipped or covered. The cups of the anemometer, which were revolving rapidly, appeared as one solid ring of fire, from which issued a loud rushing and hissing noise. The wind vane represented a flaming arrow, and a small, round, wooden stake—stuck up in the snow to show the position of the gauge—was similarly tipped, as well as an angle of our stone chimney.

"In placing my hands close over the revolving cups of the anemometer—where the electrical excitement was abundant—not the slightest sensation of heat was discovered, but my hands instantly became aflame. On raising them and spreading my fingers, each of them became tipped with one or more beautiful cones of light, nearly three inches in length. The flames issued from my fingers with a rushing noise, similar to that produced by blowing briskly against the end of the finger when placed lightly against the lips, accompanied by a crackling sound. There was a feeling as of a current of vapor escaping, with a slight tingling sensation. The wristband of my woolen shirt, as soon as it became dampened, formed a fiery ring around my arm, while my moustache was lighted up so as to make a veritable lantern of my face. The phenomenon was preceded by lightning and thunder, and was accompanied by a dense driving snow, and disappeared suddenly at 8:55 o'clock, simultaneously with the cessation of the snow. I much regret that there was no one on the peak to witness the phenomenon with me—It was a wondrously beautiful sight."—*Colorado Springs Republican.*

The Origin and Formation of the Diamond.

Mr. A. B. Griffiths contributes to the *Chemical News* a short communication, in which he attempts to point out that the formation of crystallized carbon in nature can be theoretically accounted for. He says: We know that the diamond has been found in a fine-grained sandstone in Brazil, and is principally found in an alluvial matrix of sandstone and quartz pebbles. Knowing these facts, and that there are only three methods by which crystals are formed, namely, by fusion, by solution, and by sublimation; and as the diamond has been found in sedimentary rocks, and in an alluvial matrix of sandstone and pebbles; and knowing that sandstone and pebbles are produced by the action of water, hence their name of aqueous rocks; and as aqueous or sedimentary strata are often fossiliferous, we may draw an inference that the carbonaceous matter of the fossils (plants and animal remains) has been dissolved by highly-heated water, aided by great pressure existing in the crust of the earth.

It is a well-known fact that highly-heated water, aided by pressure, can dissolve silica, as in the geysers of Iceland, etc., where it is deposited around the mouth of the vent forming "the sinter," and also we have the experimental researches of De Senarmont, and others, on the artificial production of crystallized minerals, as quartz, mispickel, corundum, heavy-spar, etc., by the prolonged action of water at high temperatures and pressures; and I think we can see no reason why highly-heated water or water-gas should not have the power of dissolving the carbonaceous matter of fossiliferous plants and animals, and then, on cooling, depositing the carbon in the crystallized condition, forming the gem known as the diamond. As to whether the diamond was formed by sublimation, we can draw no inferences from facts or from nature; so must put this method of forming crystals on one side, as not being able to solve the problem; and further, the diamond can not be formed by fusion, because we know that crystallized carbon, in the form of graphite, is formed by fusion. Therefore, it appears from these views on the subject that the diamond has been formed in nature by the solvent action of highly-heated water or water-gas, aided by enormous pressure on the carbonaceous matter of fossils contained in sedimentary rocks, followed by slow cooling.

A New View of the Earth's Evolution.

The assumption that the earth was at one time in a fluid condition, as held by Laplace, and by many astronomers and geologists, was disputed with a suggestive array of evidence by Dr. Houghton, of Dublin, before a recent meeting of the Science Association at Montreal.

Following are some of his reasons for doubting the finidity of the earth, or any other planet, at any stage of its evolution:

1. The possibility of the equilibrium of the rings of Saturn, on the supposition that they are either solid or liquid, has been more than doubted, and the most probable hypothesis concerning them is that they consist of swarms of discrete meteoric stones, discrete meaning that they are separate from each other in space.

2. It is difficult to understand the low specific gravity of Jupiter and the other planets on the supposition that they are either solid or liquid, for we know of no substance light enough to form them. If the outer planets consist of discrete meteoric stones moving around a solid or liquid nucleus, the difficulty respecting the specific gravity would disappear.

3. The recent researches connecting the periodic showers of shooting stars with comets tend in the direction of showing that comets, in cooling, break up into discrete solid particles, and that probably the solar nebula cooled in like manner into separate fiery tears, which soon modified by radiation into the cold of space.
